However, in today's world, the way cities are depicted in movies stands more in line with the social media images, creating the sense and immediacy of everyday life. Though intertwined with a fictional plot, at least on the visual level, film scenes create the sense of attainability of the depicted experiences, locations and characters. In the sense of characters, this process is the well-known phenomena of identification and parasocial interaction with the hero/protagonist, yet in the sense of experiences, this phenomenon can trigger a tourist attraction value through filming locations. The sense of reality that only films can achieve, creates a feeling of proximity in the viewer, who in turn would come to think that visiting the same location could be an imminent way of *owning* the experience portrayed as well.

This research, by taking into account only the movies produced between 2000-2020, aims at understanding the transition from the imperial capital, to the contemporary metropolis. Based on the impact of movies and TV series on the global image of Istanbul, a city of outstanding universal value, we aim to compare the geographical locations of the filming locations with the map of top tourist attractions of the city, as identified by the most popular site for touristic advice, Trip Advisor, ranking number 270 in all web sites and number 1 in tourist advice, in terms of global internet engagement according to Alexa review.

Such comparison, juxtaposed with an analysis of the tourist poses tagged with #Istanbul on Instagram, brings about a new culture that is being designed through our contemporary, narcissistic culture, fueled by the social media: On online social networks, or mobile applications like *Facebook*, *Foursquare* or *Instagram*, capitalist competition dictates the communication of what is being consumed via digital images on a daily basis. This race of sharing triggers constant comparison and further competition. Yet social status today is determined by these images – digital images that lack even "the status and power of being a *proper* image" (Baudrillard, 2009).

Similar to the way that the oil paintings have inspired advertising photography, currently, advertising photography influences our social media photographs. Publicity, by showing us that people have "apparently been transformed" through the products that they have consumed, persuades us to believe that such transformation is possible. The state of being envied is what constitutes glamour. And publicity is the process of manufacturing glamour (Berger, 1972). This process of identification and envy is the driver of the social media/influencer impact, hence the correlation between the impact of movie scenes as they transform into social media posts. A regular tourist pose in front of a monument is no longer enough to trigger the envy, an imitation of the movie scene, through seven veils of fantasy, ignites the desire to *possess* that experience and make it one's *own*.

Figure 4. Tourist pose on Instagram, resembling scenes from James Bond movies.

Figure 5. Film still from the movie Skyfall (2012). Steve Turner, posing for his article on following James Bond's footsteps in Istanbul and an Instagram user imitating James Bond on the rooftops of the Grand Bazaar.

Interestingly, this shift in the oriental image of Istanbul has created a much bigger impact in the Orient, rather than the Occident, with incredible rises in the numbers of visitors from the Arabic peninsula in the last decade. Among other regions, the visitors from Middle East countries rose up to 22,6%, in 2019 (Istanbul İl Kültür ve Turizm Müdürlüğü, 2019). This rise, obviously, does not only depend on the international movies filmed in Istanbul, but also on the soft power attained through the popularity of the Turkish TV series in the Middle East, as well as in many other parts of the world. Yet, this phenomenon can be read in many different ways: On the one hand, the Turkish interpretation of Islam, which has always been relatively progressive than that of the Arabic countries, allows for a more "Western" lifestyle that creates an "attainable attractive" experience for the audiences in these countries.

5. Conclusion

Cities as filming locations, create imaginary interfaces for the viewers, and different perspectives for the people who experience the city and for the tourists who would like to experience it. In this regard, city branding provides opportunities to create distinctive qualities to represent and to narrate a place, to embrace the stories of those who shaped the place, to generate the meaning of time in a place. The main approach is to consider both the hard (tangible) and soft (intangible) layers of placemaking while exploring the pathways of city branding. This research investigates the ways cities are represented in different movies and its reflections on the cultural heritage and the built environment. It allows us to reconsider the importance of visual culture and its reflections for the decisions of possible visitors in terms of experiencing the city. Our case study for the city of Istanbul, Turkey, presents a long history of being a site of cultural assets that are significantly depicted in many movies for decades.

The analyses of filming locations in Istanbul illustrate different genres filmed in different locations. Although genres vary, the main representations of Istanbul do not differ, it remains as it is in many ways. Directors of the movies do not introduce their own interpretations of Istanbul, so the places in these movies are used as they are, with their genuine identities. This mainly shows us that Istanbul has a unique and strong city image with all its rich historical, cultural and vibrant qualities. Nonetheless, the soft power exerted by both the movies and the TV series, by strengthening a less Oriental image, increases the value of the fantasy in the other direction as well: Once the orientalist dream of the West, Istanbul somehow becomes an occidental dream of the East, as an eternal bridge between the two, in political, geographical and cultural terms. While most related research approaches the analysis of filming locations from their contribution to the placemaking, city branding and destination marketing processes, this research takes another path to determine the role of movies in the evolution of Istanbul image, mostly in the Western eye. Though such evolution would eventually influence the way the city is perceived and have an impact in the above mentioned processes, shifting the focus from the Süleymaniye Mosque to Grand Bazaar, from the religious emphasis to the urban daily life, create bigger ripples in the overall perception of Istanbul as an orientalist fantasy, than it does in its touristic charm. Our findings also prove that the clustering of filming in the city reflects the cultural assets existing in the urban fabric.

The role of city branding and city image is a crucial aspect of upgrading the investment oriented city attractiveness. In this respect, attention should be paid to the cities attractiveness for investment and it is clear that, positive city image leads to create new job opportunities as well as innovative design and service solutions for cities. The practical implications of this study refers to city branding as a part of a cultural planning approach to the city by being a matter of cultural governance and comprehensive mapping of a city's cultural assets. These assets would have a considerable impact on placemaking, and policy implication needs to address the visual culture to construct an identity of distinction. Policy

makers should consider these (filming) locations in accordance with the current and prospective goals and objectives for Istanbul, particularly related to cultural planning and tourism. Future studies might approach this phenomenon from a more quantitative perspective, and explore how these locations contribute to tourism development and social engagement as well as the ways in which they reshaped the place.

Co-Design processes for the inclusiveness of Rome's temporary communities

Gianni Denaro*[a], Luca D'Elia[a], Safouan Azouzi[a]

[a]Sapienza Università di Roma
*gianni.denaro@uniroma1.it

Abstract | Social complexity is placing the role of Design in rethinking sociability in cities at the center of the debate. In contexts such as Rome - where urban communities are formed that share traditions, habits and ideas (Weber, 2005) - there is a need to build a change aimed at inclusion and integration. In fact, although these communities have managed to make some places their own, they still suffer from the lack of favorable environments for social innovation (Manzini, 2015).
From 2015 to 2018, the Research investigated this context by putting design good practices in contact with the temporary communities of Rome. Design becomes infrastructure (Morelli and Sbordone, 2018) to support initiatives that have developed products and services through Co-Design and Design Thinking approaches (Liedtka, 2018), resulting in a series of operations that have highlighted the role of Research in Design in connecting universities, citizens and municipalities.

KEYWORDS | INCLUSIVENESS, SOCIAL INNOVATION, TEMPORARY COMMUNITIES, CO-DESIGN, DESIGN THINKING

1. The city of Rome as a participatory Research field

The current political and economic condition, based on Capitalism and on the Neoliberal model, (Kempf, 2013; Klein, 2014) is progressively transforming the social models as known so far. This fact is favoring the social model of the commons, which veer towards a post-capitalist economy (Ostrom, 1990; Dardot & Laval, 2014; Hardt & Negri, 2014). Capitalism thus becomes both the cause of the Capitalistic model fall and the original point of the collaborative production growth that spontaneously came through network technology (Rifkin, 2014). In fact, technology has facilitated the formation of this model since it has given the possibility, quoting Mason (2016), to the educated and connected human being to act as "a new agent of change in history" (p. Xvii), tracing the footsteps of Cosmopolitan Localism (Manzini, 2014) and the interregional and planetary networking of place-based communities that share knowledge, technology and resources. This is contributing in make Design an autonomous discipline capable of "building the common as a design space" (Escobar, p. 186), thus overturning its capitalist and modernist heritage.

However, according to Fry (2015), lots of leaders and decision makers do not understand this quality of Design, making the communication work of academics and professionals more complex than it could be. The reflection on the methods and approaches that Design can adopt towards the different living communities starts from the hypothesis of Manzini (2018) that a virtuous circle can be triggered between social planning and "Politics" [1], in a set of various experiences that produce a change in the system where they operate (Transit, 2017). Consequently, designers would have to transform themselves into politicized agents of change (Fry, 2010) to overturn many deeply rooted political, economic, ideological and technological foundations. Self-generated movements provide practices and models that, with a view to preserving their social identity, must be able to be protected and cultivated by generating public services or even public policy (Selloni, 2018). In this sense, Design and Research are involved in the construction of co-design processes aimed to produce different outputs, depending on the reference context, in a form of social activism that develops a counter-narrative for social innovation (Fuad-Luke , 2009). Thus, a sort of Design activism develops that, according to Thorpe (2012), can become a tool in the public domain and a cultural, spatial and governmental tool.

Speaking of Commons, it is necessary to understand how the role of the designer, in a context of distributed and collaborative making, can design, modify and adapt products (like in the case of hacking design) and make them available to everyone.

Research tries to investigate the collaborative capacity of Design and its tools in a social context where the citizen is the core, but they have not been able to aggregate in a consistent form. This specific context is defined by the temporary communities of the city of Rome, where groups of people set up activities related to their interests or simply to their culture.

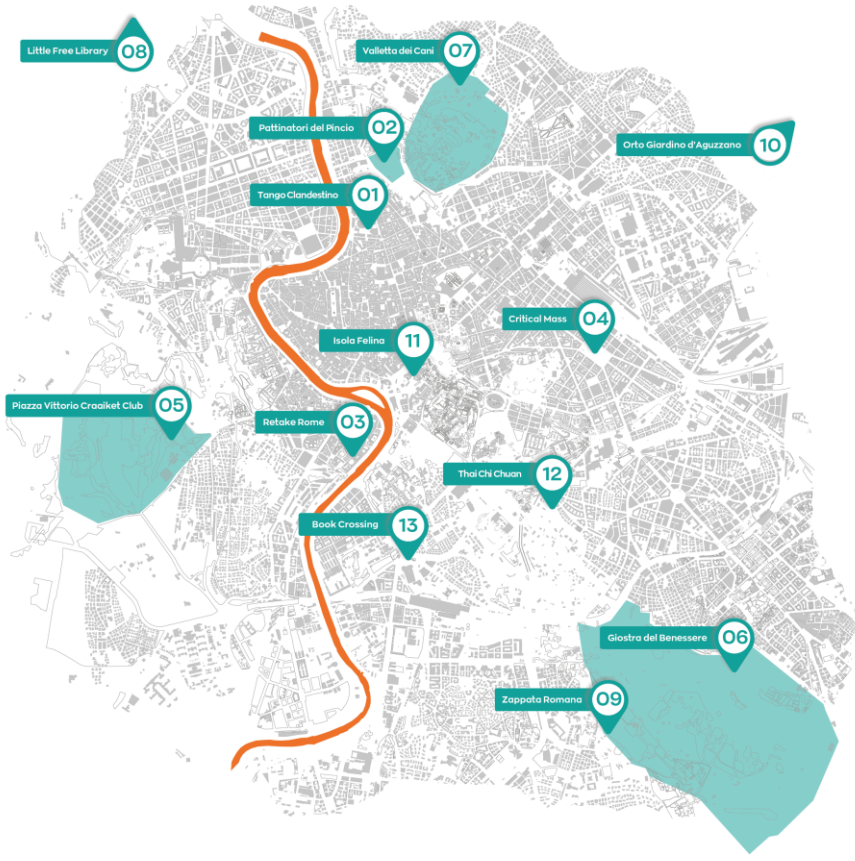

Figure 1. Mapping of the temporary communities involved by Design IN' Rome.

In this sense, Rome becomes an ideal field of investigation. Over the years, the City has in fact became a multicultural and multiethnic city. According to the 2015 CENSIS report, Rome has considerably increased its reception, as shown by the numbers that have described an increase in the number of foreigners registered in the registry, around + 115% compared to the same census in 2000 (Censis, 2015). This fact has consequently increased the constitution of temporary communities thus becoming an adequate experimentation field for this Research.

2. Design as a tool for the Capitoline temporary communities

According to a World Bank report (2013), social inclusion is the process of improving the conditions for the participation of individuals and groups in society, improving their skills, opportunities and dignity regardless of their identity. In other words, a given society becomes inclusive when all individuals are valued. It is in the face of situations of marginalization and exclusion that social innovation initiatives make sense in offering new alternatives. In recent years, this theme of social innovation has become an integral part of the vocabulary of urban regeneration, where space plays a radical role in the production of this innovation (Ostanel, 2017). Savoldi (2006) associates this inclination with a common distrust of institutions due to a reduction in forms of public investment.

Cellamare (2019) considers Rome as a paradigmatic case of this great process of retreat of the welfare state by insisting on the widespread and consolidated presence of alternative cultures and social experiences. Rome, as a "self-produced city" (S.M.U.R, 2014), constitutes an interesting context for developing reflections on redevelopment processes and forms of self-organization seen as a structural fact of contemporary cities.

In Rome, multicultural and cosmopolitan city, numerous urban realities and particular local actions were born; different forms of appropriation and reappropriation of the city and collective and organized urban practices, as forms of latent planning, in search of new conditions of mutualism. Public space and common goods - in a context that thrives on the delicate relationship between lawful and illegal - become informal places of change and innovation. Urban regeneration is a panacea for those solutions from above which over time have proved to be inefficient or deleterious, generating on the other hand a commodification of social life (Cellamare, 2018) which is accompanied by processes of gentrification (Semi, 2015) and disintegration of local cultures (Uitermark et al., 2007).

The Design'IN Rome workshop series promoted by the Faculty of Architecture of the University of Rome Sapienza has worked in close relationship with local communities on research-action projects, co-designing in different areas and neighborhoods of the capital. Design'IN Rome started from the Roman context, where urban communities share traditions, habits and ideas (Weber, 2005) with the aim of involving local communities in the design of specific solutions by exploiting technological discoveries (Smart objects and IoT) to improve livability in their areas.

From the assumptions thus presented, Design'IN Rome proposed to apply a series of design-driven methodologies for the design of solutions, including technologically advanced, for and with 13 temporary communities in Rome (fig. 1); the Aguzzano Garden, the agricultural community of Zappata Romana, the Little Free Library initiative, the Book Crossing community, the Thai Chi Chuan association, the Pattatatori del Pincio, the Critical Mass collective, the non-profit organization Retake Rome, the Isola Felina cat colony, the Valletta dei Cani municipal dog park, the independent outdoor gym Giostra del Benessere, the

independent sports community Cricket in villa Doria Pamphili and the collective of the flashmob Tango Clandestino initiative. 3 designers were assigned alongside each community

In a highly self-organized context such as that of Rome, design becomes a useful tool for understanding and developing social innovation by mediating public and private needs (Manzini, 2015). The city becomes a sort of laboratory for the development of ideas, products and services starting from the bottom and to support new behaviors and ways of aggregation to promote different forms of more sustainable urban life (both at an environmental and social level).

3. Ethnography, Experience and Speculation: action strategies for social innovation

Designers operated on three specific design levels, which guided the projects through three stages of evolution; a first phase of investigation, analytical and taxonomical of the context and of the assigned community, a second phase of experimentation and prototyping of project proposals, and a final phase of finalizing the new narratives established and project perspectives (fig. 2). Each design phase has been divided as follow.

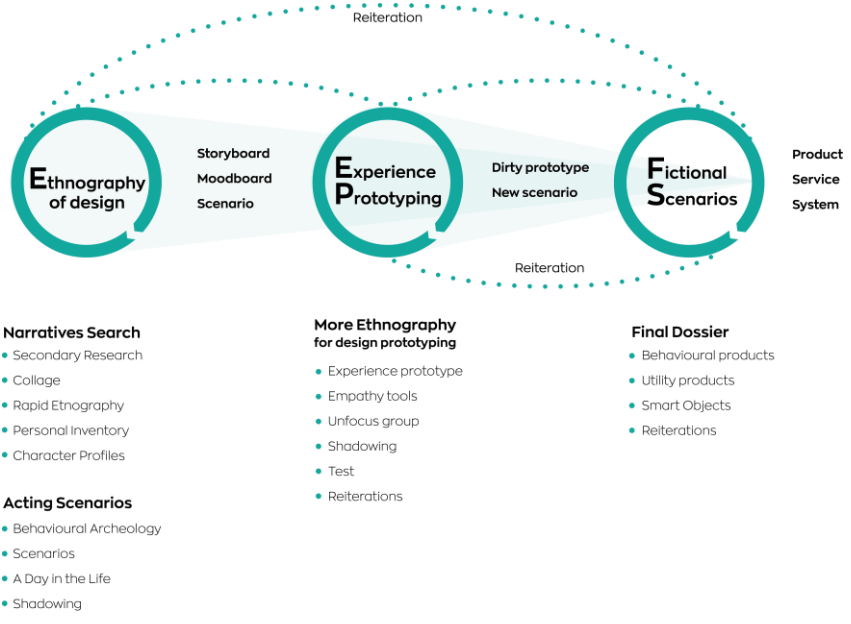

Figure 2. Schematic of the design methodologies applied during the Design IN' Rome laboratory.

3.1 Ethnography of Design

In the first phase the designers identify the narratives of the communities by adopting a restricted series of methodologies aimed at the ethnographic study by looking, interviewing and experimenting, developing a scenario that is as precise as possible. A man-on-the-street interview may not be immediately effective; therefore, a first phase of Desk Research is useful for the designer to prefigure timely and relevant questions for the reference community. People, places, actions and behaviors are then systematized by describing a general scenario of the community and highlighting the flows of interactions with objects and people, where micro-gestures become evidence of a lifestyle that reveals perceptions and values. The ethnographic study of the dynamics, rituals and meanings related to activities and artifacts results in intelligible storyboards, concept maps, behavioral archetypes (or personas) and moodboards composed of pre-existing artifacts.

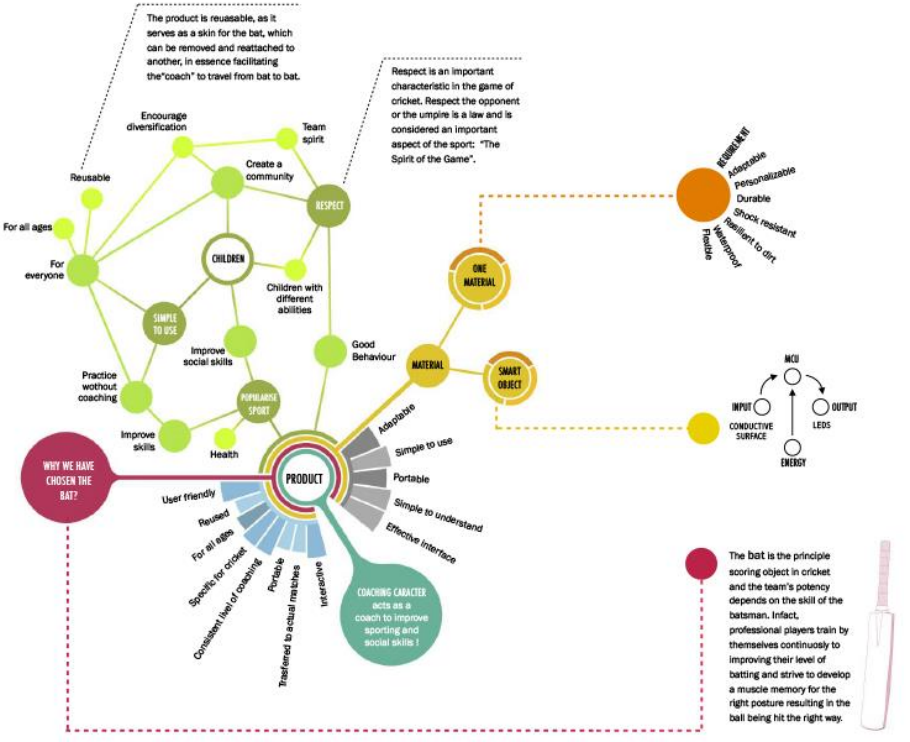

Figure 3. Concept map of the Nomi project by C. Rotondi, Anoop and M. Vasilena for the community of Cricket Players in Piazza Vittorio in Rome.

The *Noki* project by C. Rotondi, S. Anoop and M. Vasilena, has been able to identify the ethical and moral values of the historic game of Cricket, and the popular will of the community of Piazza Vittorio who practices this sport. The purpose of the community is to popularize sport and through this, to teach respect and integration among the people of the Roman community. The research activity of the team has identified within the game dynamics a potential connection with the younger generations who cohabit the surrounding public space, in search of leisure activities that know how to adapt to the frenetic rhythms of their daily lives (fig . 3).

3.2 Experience Prototyping

For the second phase, through fast implementation practices of physical models, experiential prototyping tools are introduced, through "dirty" and fast actions. Designers cannibalize and hack pre-existing products by operating through a series of iterations, bringing field experimentation together with communities through different research tools including Workshops, Empathy tools, Shadowing and Role play in order to produce a stimulating range of information fundamental to the of the project (Villari, 2013). Experiencing first-hand the difficulties of Roman cyclists during their own rally events, *Critical Barrier*, designed by D. Allotta, S. Ramezani, I. Demirsu and S. Negarestani, wanted to experiment with different ways of aggregation and reporting on the road, in order to make community events more visible in traffic and above all safer for its participants (fig. 4).

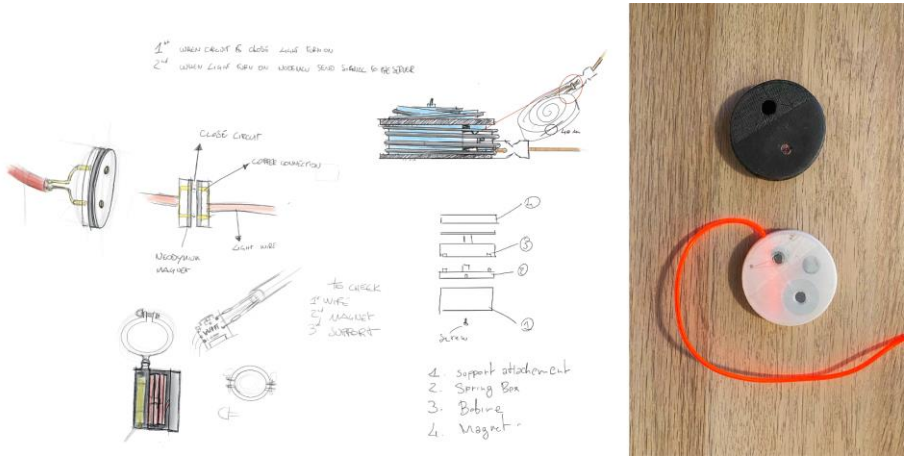

Figure 4. Sketching and prototypes of the Critical Barrier project by D. Allotta, S. Ramezani, I. Demirsu and S. Negarestani for the Critical Mass cycling community.

3.3 Fictional Scenarios

Figure 5. U.S.O.project poster (Unidentified Skating Object) by L. D'Elia, S. Doustani and A for the community of Pincio Skaters in Rome. Sayifi. Photo courtesy: Paolo E. Cenciarelli.

These documented experiences open up to new scenarios of use and behavior, identifying in the third and last phase "Fictional Scenario" the social and technological implications that the project brings with it. The designer therefore looks at the complexities of the community in a critical way as a prolific pool of behaviors and contradictions useful for an action of speculation that allows communities to visualize the real problems that are usually faced and considered as inevitable (Dunne & Raby, 2013), thus offering new possible solution scenarios. The critical view of the context implies a new awareness that is externalized and communicated through the products, services and systems generated by the co-design processes. The technological dimension takes over in response to the need to evolve and intensify an energy network (Rifkin, 2014).

The *U.S.O. (Unidentified Skating Object)*, designed by L. D'Elia, S. Doustani and A. Sayifi, wanted to speculate on the feeling of alienation experienced by the community of Pincio Skaters in their relationship with a public management that does not recognize the skater in the spaces shared neither as a pedestrian nor as a vehicle (such as a scooter or bicycle). Feeling "alien" and proud of this peculiarity, the project is dressed in attributes coming from the science fiction world to encourage new members and curious to a completely different

exercise activity, supported by new technologically enhanced actions and interactions (fig. 5).

4. Conclusions

The research and experimentation activities applied during the workshops have brought out from the Capitoline social fabric a latent planning of the communities and new design spaces which, together with the theme of social inclusion and the active role of the citizen, are issues addressed marginally by the Public Administration when it comes to social innovation (Balbo, 2015). In this open scenario, design can operate in order to reveal the needs and will of the community, transforming them into possible solutions of public utility. In 2016, the exhibition "Design'In Rome" at Casa della Città (fig. 6) exhibited the design results of the course, highlighting the role of academic research and design in connecting universities,

Figure 6. (above) Exhibition of the projects held at the Casa della Città, in Rome (below) Invitation made by (omitted for review) for the event.

citizens and municipalities, and in applying design knowledge in real contexts (Meyer & Norman, 2019). It is emphasized that research in design, in order to face the new ways of living in a social and innovative space, searches in the built spaces (both physical and virtual), products and services capable of taking into account the cultural value of the ethnic variety present in a cosmopolitan city like Rome, applying the best practices of Co-design and Action Research. This contribution presents an overview of alternative scenarios that are emerging and evolving on a global scale.

Note

[1] Ezio Manzini in the working paper of the conference "Social and Political Planning", organized by cheFare at the Milan Triennale on 19 October 2018, defines Politics (with a capital P) as "the set of contents, organizations and methods that allow a company diversified and complex to exist and, if possible, progress towards higher forms of civilization".

Co-designing the future of a public space and its related services. The case of the Reggio Emilia Ducal Palace and its park.

Marta Corubolo, Anna Meroni, Daniela Selloni

Politecnico di Milano, Dipartimento di Design
daniela.selloni@polimi.it

Abstract | This paper describes an extensive co-design process conducted by the authors, a group of researchers of the Polimi DESIS Lab, to imagine the future of the Reggio Emilia Ducal Palace and its park, in Italy.
As an effort to co-design *urban commons*, it implied two main challenges: the first one deals with how urban commons might be co-designed, being characterized by diversity of actors and interests; the second one is connected to exploring how urban commons can be complemented including (public) services as an integral part of them, and thus, how to deal with their 'intangible' facet, that is about the interaction that will take place.
The paper concludes reflecting on the opportunity of including the expertise of service design in creating the social and infrastructural conditions to foster the development of urban commons and to make it a standard for any project, since it contributes defining the public interest activities that shape an important part of the commons.

KEYWORDS | URBAN COMMON, CO-DESIGN, SERVICE DESIGN, SCENARIO BUILDING, MULTI-STAKEHOLDER ENGAGEMENT

1. Background knowledge: on urban commons, co-design and service design.

In the last decade, we assisted to the emergence of a variety of activities labelled as 'co-design processes', ranging from urban planning to community building and conducted under the auspices of the private, public and third sectors (Meroni, Selloni, Rossi, 2018; Trischler, and alt. 2018).
In this paper we discuss a co-design process developed by the authors for the Municipality of Reggio Emilia, a mid-sized town in the centre of Italy: its main objective was to imagine the future of the Reggio Emilia Ducal Palace with particular reference to its park, a huge public space in the outskirt the city.
This park is considered by the city inhabitants as an *urban commons*: a place of shared interest, critically important to the city environment, perceived as a symbolic space that gives a community its identity and facilitates social interactions (Ostrom, 1990; P2P Foundation, 2019).
The notion of urban commons is central for our argument, because we discuss one of the main challenges that urban commons currently face: i.e. how they might be co-designed, since, more than traditional commons, they are characterized by great heterogeneity of interests and participants, and need a support process to reach alignment and consensus (Foster, 2011; Iaione, 2012; Seravalli, 2018).
Urban commons may be considered 'new commons': Hess (2008) mapped the new commons out, identifying numerous categories, such as tangible and intangible commons, cultural commons, knowledge commons, global commons, infrastructure commons and many others. According to Hess, urban commons fall under the wider category of 'neighbourhood commons' that incorporates "both urban and rural commons where people living in close proximity come together to strengthen, manage, preserve, or protect a local resource" (2008, p. 16).
In particular, she argues that theories and practices of neighbourhood commons draw especially on the so-called literature of 'reclaiming the commons'. In the same line of thinking, Marttila, Botero and Saad-Sulonen (2014) identify a strand of commons as the activist/practitioner movement, which considers commons as a means for social change and democratic governance (Bollier and Helfrich, 2012; Bauwens, 2009). Therefore we can assume that urban commons are conceived not only as shared resources, but also as processes: set of practices focused on how to create (other) commons, how to support and govern them, that is a set of "collaborative arrangements for value production processes" (Seravalli, 2018 p.1.).

On the one side, we build on this approach to commons to discuss an experimental programme of co-design activities for the Reggio Emilia Ducal Palace and its park, conceived and implemented to design a place intended to be part of the urban commons. It is consolidated (Pór, 2012) that aligning interests between participants and educating people to participate in processes aiming at this are today two of the main challenges to co-design

urban commons. We can interpret this approach an evolution of the concept of 'community-centred design' (Meroni, 2008), in which design is recognised as a way to the facilitate a process of engagement and progressive learning between the members of a community and between it and the whole society. The continuous work of activating and structuring strategic conversations on the future is, in fact, a way to exchange value between people: this is functional to design a scenario, to find opportunities of reciprocal interest, to create relationship and develop mutually beneficial solutions (Pahk, Self and Baek, 2018) in a value co-creation logic that has network orientation and contextual nature (Vargo and Lush, 2016). Paraphrasing Vargo and Lush (2016), we can say that an effective community-centred design should support the actors of a given context to engage in a process of benefiting their own existence through benefiting the existence of other actors with service-for-service exchange or the provision of some output. The value so created is therefore an element of the 'new commons' and we assume it is maximised by the diversity of interests and views that find a way to co-exist.
The multi-stakeholder co-design process conceived and implemented for the city of Reggio Emilia involved actors from the private, public and third sectors, experts from the academia and associations from the civil society. They were selected and activated by the public administrators in order to consider different perspectives on the present and future of the Palace and the park. As Iaione and Foster (2016) state, in *urban commoning* implies having someone that plays the role of 'enabler' in managing negotiations and cooperation between participants with divergent interests. Here it comes the opportunity to conduct co-design activities with diverse methods and tools in order to allow multiple participants having different voices collaborate in a design process, applying an adaptive and iterative design approach (Meroni, Selloni, Rossi, 2018). This way, the activation of co-design initiatives can be seen as a service that the public administration offers to nurture the birth and flourishing of new commons.

On the other side, we explore, through this experimentation, possible relations between service design and urban planning, aiming at testing at the city level two of the very axioms of the service dominant logic (Vargo and Lush, 2004; Vargo and Lush, 2016):

- Service is today the fundamental basis of exchange and, therefore, goods are distribution mechanisms for service provision. In the Reggio Emilia project we assume "goods" to be spatial arrangements.
- Service-centered view is inherently beneficiary oriented and relational. In the Reggio Emilia project the value co-creation was intended to activate processes of reciprocity of exchange, facilitated by shared institutions (here intended as "rules, norms, meanings, symbols, practices, and similar aides to collaboration" Vargo and Lush, 2016, p. 6) that coordinate this exchange.

In fact, the challenges around the design of urban commons are not only connected to the related participatory process, but also to reconsideration of the idea itself of urban commons: the co-design process outlined for the project was aimed at conceiving the future

activities to be carried out in the park in terms of functions and services, rather than and prior to designing the public space in its physical aspects. This implies that the future common denominator of the production and exchange of value in the Ducal Palace and park was the application of specialized knowledge, mental skills, labour and the sharing of assets, "embedded" by the spatial arrangements.
Therefore, the starting point of the Reggio Emilia project was that an artful design of the activities that might take place in the future and qualify the area would have informed the design of the space with an increased awareness of the final users and of the visions of possible future stakeholders. This approach to urban commons, also, assumes that (public) services and relational activities are integral parts of urban commons, since (public) spaces are so. Not by chance, Iaione (2012) in defining urban commons not only includes physical resources as parks, squares, local streets, and public spaces in general, but also a diversified number of services, including public transportation, water service, urban health, gas and electric distribution and many others.
Overall, we assume that the Reggio Emilia project's combined approach of structuring collaboration processes, putting the service perspective prior to the landscape design and adopting a relational perspective, is a way to envision new ways to integrate and beneficially apply potential resources for a shared purpose.

2. The case study of "Rival(u)ta Rivalta"

"Rival(u)ta Rivalta" (a title that can be translated as "Re-value Rivalta") is the project we delivered as researchers of the Polimi DESIS Lab of the Department of Design of Politecnico di Milano for the Municipality of Reggio Emilia, which is part of the wider Ducato Estense development financed and promoted by the Italian Ministry of Cultural Heritage. Its specific objective was to renew and reinvent the Reggio Emilia Ducal Palace and its huge park, in the suburb of Rivalta.
It consisted of a process of strategic codesign of scenarios for the future of this space, conducted with local actors. It initially explored the varied and often conflicting perceptions, experiences and wishes of the stakeholders for the area (phase 1), and then defined, in a dialogue with the public administration, a first interpretative framework to orient the following design phase. On the base of this, through a sequence of co-design workshops (phase 2), 6 service-based scenarios were produced to inform the first phase of a landscape-design international competition concurrently launched (phase 3). As a final stage (phase 4), a codesign workshop, involving the designers and the team of the winning project (a group made up of Openfabric, Casana, F&M Ingegneria) was organized to develop 2 macro-scenarios, following the criterion of integrating the characteristics of the spatial proposal with the emerged imaginary. These final scenarios have the aim of stimulating a strategic dialogue around the Reggio Emilia Ducal Palace and its park and of guiding the final implementation of the project.

2.1 Phase 1: Generative listening

The expression 'generative listening' refers to the goal of broadening the scope of the initial analytical phase from the collection of information, in the traditional sense, to the stimulation of conversations about the perceptions, desires and expectations on the Ducal Palace Park. The process was structured as a series of interviews to 26 local stakeholders, selected in collaboration with the Municipality of Reggio Emilia among the most active and relevant actors in the cultural and associative field as well as among experts in more technical sectors.

In order to provoke and enable a generative conversation, each interview was structured by using a set of tools that had the goal of exploring both present and past conditions related to the area, as well as possible activities to be carried out inside and outside the palace. More in detail, the tool named 'The Ducal Palace park: yesterday and today' guided the dialogue around the map of the place, investigating distinctive positive and negative elements in terms of potential resources, barriers and criticalities. While the set of cards 'The Ducal Palace park: tomorrow' has been used as a stimulus to explore 6 thematic clusters of activities: agriculture and production, work and employment, art and culture, entertainment and recreation, sport and wellness, landscape and nature. Building on the expertise, knowledge and network of the actors involved in this phase, each thematic area was then discussed in terms of impact on the management and revenue model, on the accessibility and on the identity of the place.

The choice of identifying 6 themes emerged from the initial scoping phase carried on with the Municipality and from the analysis of existing data and reports. Results of the generative listening phase were, indeed, a baseline knowledge framework and an orientation towards different design hypotheses, which have been re-discussed with the Municipality and served as inputs for the following steps.

2.2 Phase 2: Co-design sessions

The second phase was planned as an intensive programme of workshops with diverse stakeholders to explore multiple service areas. Building upon the results of phase 1, we elaborated a preliminary map which was then implemented and adapted to the strategic orientations and policies set by the Municipality.

From this dialogue, a Scenarios' map emerged (Fig. 1). It presents 4 main directions: the central one represents the core theme (Park of the Nature), while the surrounding areas support the exploration of alternatives (Park of the Agriculture, Park of the History and Park of the Wellness).

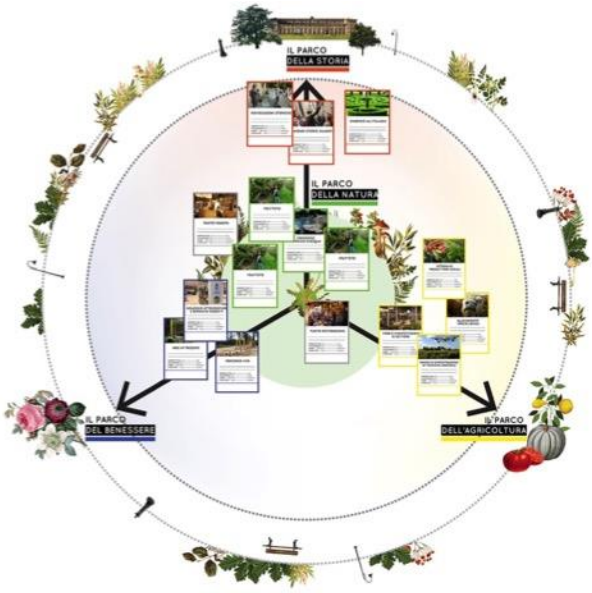

Figure 1. The Scenarios' Map developed to guide the co-design sessions.

In addition to the map, we produced a catalogue of cards (Fig. 2) representing potential services and activities, thanks to a preliminary study of existing case studies. This deck of cards, together with the Scenarios' map, were the main tools designed to conduct the workshops.

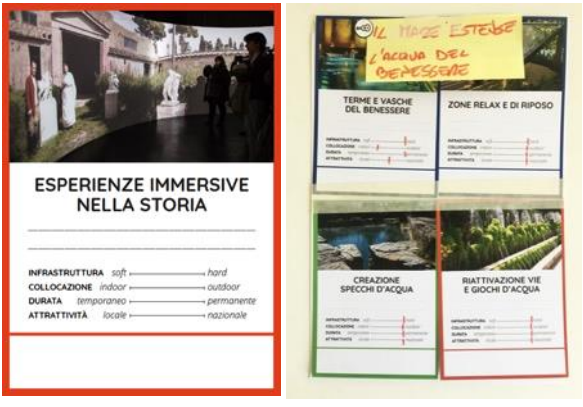

Figure 2. Example of the cards designed to explore services and activities and of the elaboration of a personal vision.

This phase comprised 5 co-design sessions and involved a total number of 42 participants, partially identified among the participants to the first phase, and partially among new relevant stakeholders belonging to cultural institutions, NGOs, universities and local authorities. Each session was organized around 3 main steps.

Step 1: the creation of a personal vision. After introducing the Scenarios' Map, each participant was invited to select, from the deck of cards, 4 activities, that combined together presented a personal vision for the future, in the form of a consistent series of services for the Ducal Palace park. Additionally, participants were asked to evaluate, for each card, some characteristics that might impact on the service model (type of infrastructure, location, duration and scale of attractiveness) and to enrich or modify the cards according to them (Fig. 3). Finally, the personal visions were placed on the Scenarios' map and discussed, merged and combined in a collective session. In this circumstance, participants have been aggregated in couples according to links between their visions, in order to start thinking to the stakeholders involved or impacted by the future arrangement.

Figure 3. The co-design sessions.

Step 2: the evaluation of the qualifying elements. The second step was focused on assessing the resulting visions according to 4 main qualifying elements. The Ducal Palace park should indeed also comprise the following qualities:

- Digital: the park is enabled by advanced technological solutions;
- Educational: the park has a strong didactic and popular approach;

- Recreational: the park offers opportunities for entertainment, conviviality, meeting;
- Sustainable and circular: the park is based on elements of ecological sustainability and circular economy.

These qualities emerged from the generative listening phase and from the dialogue with the Municipality: they contributed to characterize the range of activities chosen by each group.

Step 3: the analysis of the transversal areas and the definition of the Actors' map. The last step of the co-design session aimed at including into each vision a number of additional activities that relate to transversal areas and complete the map of the Ducal Palace park. These transversal areas are linked to the perception and imaginary associated to the park, and emphasise its being a place of relief and conviviality, active and inclusive participation, of accessibility, of openness, of entertainment and recreation.
As a last activity, groups focused on the identification of the stakeholders to be involved into the implementation of the scenario and on the various management models to be foreseen. The output of this phase was an Actors' map for each group in which they identified the key-protagonists of their scenario, outlined a hierarchy and a set of connections between them.

2.3 Phase 3: Scenario development and integration to the international landscape design competition

The third phase of the process was aimed to inform the international landscape design competition that was meanwhile conceived and launched to select a spatial design for the area. For this purpose, we developed 6 main scenarios (Fig. 4) building upon the results of the previous co-design process:

- The Mindful Park: a place of silence
- The Water Garden: history trough engineering and nature
- The Active Park: sport and social agriculture in action
- The Innovation Garden: an agricultural landscape to live and experience
- The Climate Oasis: a piece of nature within the city
- The Welcoming Garden: a path toward a collective wellbeing.

The description of these scenarios was further elaborated in a report that included: the narrative aspects of each scenario, a series of activities to be included as potential functions and services and some distinctive features with reference to architectural guidelines provided by the competition's brief. The report became therefore an integral part of the brief made available to the 5 finalists of the international competition. This way, the take-up of elements selected from the scenarios was assured, since they were supposed to be embedded in the final design of the proposal.

Figure 4. The 6 scenarios developed to inform the international landscape design competition.

2.4 Phase 4: integration to the landscape design-winning project.

The connection of the results of the co-design process with the landscape design competition was further elaborated in this last phase. After the selection of the winners, we engaged them in a co-design activity in order to converge towards a consistent and integrated proposal. More in detail, the 6 service-based scenarios were reviewed with reference to the characteristics of the winning project.

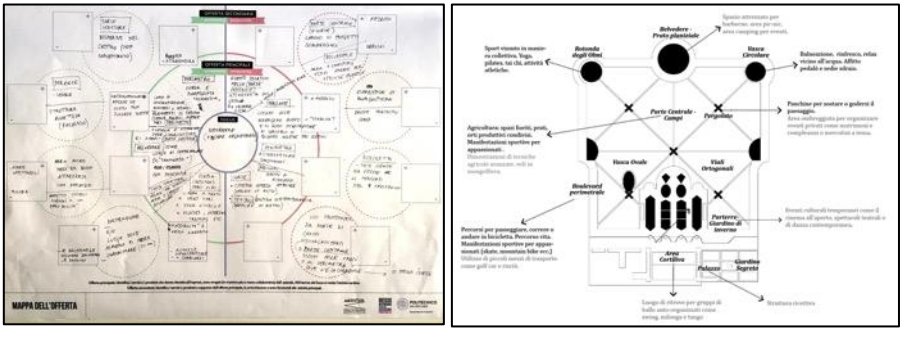

Figure 5. The Wellness Park offering Map (Polimi DESIS Lab) applied to the spatial project by ©Openfabric, Casana, F&M Ingegneria.

By using an expanded Offering Map (Fig. 5), primary and secondary levels of activities were identified. Then, building upon this work, the design researchers elaborated 2 macro-scenarios (Fig. 6):

1. The Wellness Park, which elaborates the themes of health and living well, mainly resulting from the scenarios 'The Contemplative Park' and 'The Active Park'.
2. The Habitat Park, which refers to the themes of landscape, nature and harmony between humans and the surrounding environment, mainly resulting from the scenarios 'The Circular Oasis' and 'The Contemplative Park'.

After being discussed with the landscape designers, they resulted in a comprehensive plan for services and solutions, meant to orient the final design of the park. At the same time, they can be seen as a powerful means to keep the narrative, vocational and poetic dimension of the initial scenarios within the project.

Figure 6. Visualization of the final macro-scenarios: the Wellness Park and the Habitat Park

3. Reflections and conclusions

The outcomes of this co-design process aiming at the generation of future scenarios for the Ducal Palace and park are, now, constrained by the stage of the work of the entire project, which is in the final development of the executive project.
Yet, they can be discussed with regard to the effectiveness of the co-design process that brought about the activation of a dialogue with the stakeholders, the generation of service-based scenarios that informed a landscape design brief, and the integration with the spatial design project.

Considering the whole experimentation as the first step toward the design of new urban commons, it can be first assessed against its capacity to generate strategic dialogues and outputs (specific scenarios) that could integrate different interests, perspectives and resources in a mutual beneficiary exchange. The evidence of the above can be summarised in the following points:

- The variety of perspectives emerged from the interviews (conducted in the first phase of the process) that we grouped in a set of reflections on the present situation, of opportunities for the future and of possible criticalities are a good evidence of the openness of the process that guided the participant throughout a reflection without imposing perspectives. In fact, the topics emerged as qualifying the present and the future of the place, transcended or sometimes neglected those suggested by the interviewers to prompt the conversation: topics as 'food', 'hospitality', 'technology' or 'sociability' emerged, while 'work' or 'job' were not considered as relevant.
- The even bigger variety of visions generated during the workshops (one for participant, for a total of 42, conducted in the second phase of the process) eventually grouped by the designers in 6 scenarios (in the third phase of the process), came out easily, often in a positive flow of conversation with the other participants of the same session, alternating individual and collective thinking. We can assume this variety to be encouraged by the numerousness and diversity of the activity cards provided for the co-creation: nevertheless, the nature and distinctiveness of the 6 scenarios is completely transversal to the proposed orientations and extremely rich of inputs that neither came out from the previous interviews and conversations, nor were provided by the designers.
- The criteria with which the different visions were clustered and arranged in scenarios were based on the actual and logical possibilities to combine a variety of comparable or complementary inputs in meaningful wholes. Each input represented an individual view and the related interests, including the resources (competences, assets, skills, and much more) that each participant explicitly or implicitly wished to put in the future system. By combining them together, we aimed to draft future service ecosystems (Vargo and Lusch, 2016) meant to generate value for all the stakeholders and for the citizens or visitors; this accomplishes the abovementioned logic of the urban commons as valuable because of the way they have been generated and because of their very nature. This work has been facilitated by initial reflections on the possible combinations of actors that could manage the activities in the future.
- The people involved in the co-design process, stakeholders and experts identified by the Municipality of Reggio Emilia, often knew already each other, but most of the time did not: whatever their condition was, the workshops were for them opportunities, often the fists, to talk together in a constructive and creative way about the future of the Palace and the park. As such, we may assume they were

> also opportunities to ignite future processes and purposeful connections, including the discourse about the future co-governance of the place.

Another way to assess the whole experimentation is against the relevance and the 'dominance' of a service design perspective and orientation in the design of the landscape and in the spatial design. This turns into evaluating how the scenarios, which were made part of the brief received by the 5 finalists of the international competition, actually influenced or even informed their final design proposal.
The scenarios were described as a consistent mix of temporary and permanent activities (and therefore services and relations) and in terms of requirements for the natural capital and the built environment. Looking at the material delivered by the team of architects and experts that won the competition, we can find a systematic review and elaboration of future activities to be implemented in the area, freely chosen from the proposed scenarios and organised by typologies and fields that draw from the them. The same are described in their duration in time, extension and possible economic return for the future management and the public administration. They are also narrated in terms of occupation of the space and needs for dedicated infrastructures and arrangements and are sketched in the design of the place, which has been actually conceived to change according to them. This made the design unique and notable for its liveliness and dynamicity, and let us deduct a good degree of permeability of the landscape design to the proposed scenarios. This descriptive material delivered for the competition was the basis for the following collaboration, aiming at merging the service and the landscape design.
In fact, as described in the section 2.4, by matching this design with the 6 scenarios produced in the third phase of the work, we proposed 2 "merged" scenarios that could have been better materialised by the design of the park. From here, we organised a final workshop with the project leader of the winning team of Openfabric, Casana and F&M Ingegneria. For the workshop, a very peculiar service design tool, the Offering map, was adapted to the circumstance by hypothesizing a placement of the different activities and services into the spatial characters of the landscape design, the so-called 'intensità progettuali' roughly translatable as 'design concentrations'. During the workshop, we acknowledged a good alignment of the visions with the architect, yet had to make an effort from both sides to merge, through the tool of the Offering map, the different mind-sets: one 'space driven', the other 'service driven'. Hence, the activities presented in the map were finally associated to the 'design concentrations', so to create a fully integrated space and service artefact. In the view of optimising the interaction for a future activity, this integration could be better designed in the template of the tool.

As a conclusion of the experience, two macro-scenarios have been delivered, each one characterised by slightly different meanings and activities and both suitable to be materialised by the landscape design. The very reason for being two rather than one is the acknowledgment that the civic process of development of the whole project of regeneration of the Ducal Palace and park is still far to finish. In fact, in parallel to the construction of the

landscape arrangement, the future management system and its 'institutional arrangements' will be defined: we may assume this will be a public-private partnership that is likely to start-up with a set of rules "that together constitute a relatively coherent assemblage that facilitates coordination of activity in value-co-creating service ecosystems" (Vargo and Lusch, 2016, p. 18). The two scenarios, therefore, are intended to activate and steer this future conversation, which will be coordinated by the public administration, following the logic to establish collaborative processes as an imperative for the creation of urban commons. Notably, the guiding and coordinating role of the public administration has been crucial throughout all the process with different strategic decisions:

- to carry out this process in order to contribute nourishing the projects produced by the teams of architects and expert. This decision was central, because it builds upon the idea that the design of a (public) space could be informed by the design of (its) services, and so the development of specific activities builds the identity of a space- an urban commons - in every aspect;
- to select the participants to the process, intentionally excluding citizens in this phase. They engaged, instead, subjects that aggregate different interests and experts, in order to start a conversation about the future on the base of knowledgeable and informed experiences and views;
- to dialogue closely with the researchers, in order to progressively define orientations and making decisions according with what was emerging from the co-design process, yet having a broader view on the city development as a whole.

In the perspective of creating the social and infrastructural conditions to foster the development of urban commons, we deem that the expertise in service design is crucial: in fact urban commons are shared resources and, at the same time, the collaborative arrangements that design them, the institutions that regulate them, and "the community that devises the institutions, both shepherding and benefiting from the resources" (Huron, 2017, p.2). Acknowledging that service design is the activity of planning and organizing people, infrastructures, communication and material components of a service (Sangiorgi and Prendiville, 2017), the systemic and collaborative approach embedded in service design as the one developed for the Reggio Emilia co-design process, could be considered a case to start from in order to make it a standard for any project, and in particular for those regarding public interests.
These activities are a "continuous process of building relations with diverse actors and by a flexible allotment of time and resources" that qualify the contemporary strategies of infrastrucuring (Hillgren, 2013 p.81). Furthermore, it might help creating in (not only) public organizations the social infrastructures that empower human beings to creatively and continuously support each other and taking projects forward (van der Bijl-Brouwer, 2017).

Collaborative Futures: a pedagogical model for delivering future-focused and citizen-centred design education

Marianne McAra*[a], Kirsty Ross[a],

[a]The Glasgow School of Art
*m.mcara@gsa.ac.uk

Abstract | The authors present a pedagogical model for delivering future-focused design education, drawing on "Collaborative Futures" as a case study. This project brought together a cohort of final year design students and early career design graduates who worked in collaboration with the Glasgow City Council to explore and prototype future-based, citizen-centred scenarios set in the context of Glasgow 2030, which focused on data experience, people, place and practice. The collaborative nature of the project extended learning beyond the higher education design studio – providing the students with the opportunity to engage in professional practice through collaborating with early career graduates, and with an external organisation and industry-experienced designers. The authors critically reflect on the context-led project process, the collaborative design culture fostered, and the future-focused outcomes – theoretically unpacking the value and challenges of studio-based learning and multidisciplinary collaboration, insights from which are shared as a transferable pedagogical model for design educators.

KEYWORDS |: FUTURE-FOCUSED, DESIGN PEDAGOGY, CITIZEN-CENTRED, COMMUNITIES OF PRACTICE, KNOWLEDGE ARTEFACTS

1.0 Introduction

In this paper the authors present a pedagogical model for delivering future-focused design education, drawing on Collaborative Futures – a project delivered as part of the Masters of European Design programme at The Glasgow School of Art (GSA). This project brought together a cohort of final year design students and early career design graduates, who worked in collaboration with the Glasgow City Council (GCC), professional designers, and civic and academic stakeholders to explore and prototype future-based and citizen-centred scenarios set in the context of Glasgow 2030. With a focus on data experience, people, place and practice, the aim was to explore, evaluate and prototype emerging frameworks for open innovation so to inform GCC's strategic aim to be recognised as a well governed city that listens and responds to its citizens. The collaborative nature of the project extended learning beyond the higher education studio context – providing the design students with the opportunity to engage in professional practice through collaborating with early career design graduates, and with an external organisation and industry-experienced designers. This pedagogical model, now in its sixth iteration, has been implemented in a range of contexts. The first (in 2014-15) explored the future of social services in collaboration with the the design division of Hitachi; the second (in 2015-6), third (in 2017-8) and forth (2018-19) explored the future of banking in collaboration with the Royal Bank of Scotland (Ross, 2018). This latest iteration (2019-2020) is the first time, however, that a researcher (Author A) has been embedded in the project. Based on this research conducted alongside the project delivery, the authors critically reflect on the context-led project process, the collaborative design culture fostered, and the future-focused outcomes – theoretically unpacking the value, impact and challenges of studio-based learning and student-graduate collaboration in a multidisciplinary team. The relational and experiential proximity highlighted in this project is discussed through the lens of Communities of Practice (Lave and Wenger, 1991; Wenger, 1998) and Boundary Objects (Star & Griesemer, 1989; Binder et al., 2011; Brandt, 2006), insights from which are shared as a transferable pedagogical model for design educators. The paper begins by describing the evolution of the model and the key design practices informing it before setting out the research framework employed to gain an empirical understanding of the pedagogical process. The authors then present the case study and, through discussion, unpack their key insights. The paper concludes by the authors summarising the implications and value of their findings for delivering future-focused and citizen-centred design education.

2.0 Evolution of the Pedagogical Model

Design Innovation seeks to address complex social, cultural, political, economic and technological challenges through context-led collaborative and creative engagement with communities and individuals. As a practice, Design Innovation is underpinned by the ethos of

social design (Bannon & Ehn, 2012; Manzini, 2015) and participatory design (Binder et al., 2011; Björgvinsson, Ehn & Hillgren, 2010; Frauenberger et al., 2015; Simonsen & Robertson, 2013); drawing on co-design and speculative design approaches and principles as a critical exploration, examination and evaluation of the opportunities that may lead to preferable futures. Key here is recognising users and potential users of design and other stakeholders as experts of their own indigenous knowledge and "experience domain" (Sleeswijk Visser, 2009: 5), and their repositioning in the design process as equal collaborative partners with the designer (Sanders, Brandt and Binder, 2010). Collaborative Futures points more specifically to speculative (Dunne, 2008; Dunne and Raby, 2013) and transition (Foth, 2018; Irwin, 2015; Irwin, Kossoff &Tonkinwise, 2015) design approaches. As described by Dunne and Raby (2013: 3–6), speculative approaches are used to explore alternative futures so to better understand and critically reflect upon the present, whereby design is used to provoke and open up debate. Centred on embedding these approaches, the curriculum framework underpinning the project has evolved over a series of iterations. The intended learning outcomes for the students centred on developing professional practice through collaborating with external partners, creatively engaging with users and stakeholders, producing a range of designed deliverables, and communicating the outcomes of the project to a range of audiences.

At GSA, pedagogy is centred on the principles of social and collaborative learning in the shared and immersive environment of the studio (Lynas, Budge & Beale, 2013) that scaffolds a culture of exploration, experimentation and prototyping (Bull, 2015), and which seeks to foster a Community of Practice (Leve and Wenger, 1991; Wenger, 1998). Within this, as learners become more fluent in their design practice, they are engaging in a tacit sense-making and reflective dialogue between themselves and the making and problem-solving process, and with their peers (Budge et al., 2013; Schön, 1985; Shreeve, 2015; Zehner et al., 2009). Drawing on these key tenets of studio-based learning, the pedagogical model presented in this paper supported the student-graduate team to work on a live project, undertaken over three discreet phrases, and which required the generation of a series of designed deliverables described below.

Figure 1. 2015, 2016. Research Cards from Previous Collaborative Futures Projects.

2.1 Phase 01: Discover and Define

The aim of Phase 01 is to scope the context through combining quantitative and qualitative research methods – conducting desk research in parallel to ethnographic engagement and interviews with expert stakeholders. Research insights are then translated into a visual data bank that can be contributed to by the collaborators, as well as drafting emerging themes into a set of Research Cards. Research Cards have become a key component in this phase of the model over the last six years. Converting research themes, which at the early stages of the project can feel conceptual and abstract, into physically designed artefacts provides the student-graduate teams with analytical lenses through which to view, sort, and interrogate subsequent data through (see Figure 1). The Research Cards are subsequently iterated over the course of the project (used as an analytical tool in Phase 02 and presented to project partners as a designed outcome in Phase 03).

2.2 Phase 02: Develop

The aim of Phase 02 is to translate the research themes into a family of knowledge artefacts and refine these through conducting primary research. In-line with speculative design approaches, this includes prototyping a future world (in this project, an imagined Glasgow 2030), a suite of future citizens who would populate neighbourhoods in this world, and a set a scenarios forecasting narratives that characterise the citizens' behaviours, beliefs and

interactions. These knowledge artefacts are also used as speculative tools in the design of creative engagement workshops with participants (citizens and stakeholders) to further exploration. At touchstone points during this phase, expert input is provided by faculty, and by external designers and researchers, to support the student-graduate teams to synthesis and evaluate their research.

2.3 Phase 03: Deliver

Following the engagement workshops, the student-graduate team undertake formal analysis so to generate the final, fully realised, suite of knowledge artefacts. Other key project deliverables include producing a set of indicative design directions for the project partners, a range of materials setting out the project design process and the student-graduates evaluation and reflections of this, and a digital archive.

3.0 Research Design

In seeking to gain an empirical understanding of the pedagogical process, the embedded researcher (Author A), gathered experiential insights from the teams, with the aim to inform the design and delivery of the next iteration of the project and to answer the following research questions:

- In what ways does the pedagogical model support interdisciplinary collaboration between the student-graduate team, the Glasgow City Council, expert stakeholders, and external participants?
- In what ways can Design Innovation be embedded as an approach to future-casting the experience, needs and opportunities of Glasgow's citizens in 2030?

The insights presented in this paper were collected through observations, student-graduate feedback, reflective project blogs (with contributions from the students, graduates and GCC team) and from an evaluation group interview with the student-graduate team. In section 5, the authors draw on the theory of Communities of Practice (CoP) (Lave and Wenger, 1991; Wenger, 1998) to unpack key learnings pertaining to the relational proximity of collaboration that took place across the teams. As described by Wenger, CoP positions the social and collective nature of "learning as social participation", whereby communities are predicted on practice (1998: 4). As described in section 2.0, establishing and sustaining a CoP is core to studio-based learning – theory which underpins the pedagogical model presented in this paper. Building on this, Boundary Object theory (Star & Griesemer, 1989; Binder et al., 2011; Brandt, 2006) will be drawn on to sense-make the role knowledge artefacts played in future-focused engagement and the experiential proximity of exploring the near and distant future so to critically reflect on the present. As Star and Griesemer explain, Boundary

Objects can communicate across and connect diverse social worlds whilst retaining distinct and idiosyncratic meanings, as “their structure is common enough to more than one world to make them recognisable” (1989: 393).

4.0 Case Study: Collaborative Futures

In this section the authors present the Collaborative Futures case study before discussing the key learnings, implications and value of the project as a pedagogical model in respondence to the underpinning research questions set out in section 3.0. The case study is structured by the key touchstone activities that occurred in each phase, evidencing the relational proximity concerning the nature of collaboration, and experiential proximity concerning the role of knowledge artefacts in the context of future-focused, citizen-centred design education.

4.1 Discovering and Defining: knowledge landscapes

The Collaborative Futures project launched in September 2019 with an induction, where both teams collectively unpacked the project brief. As a key objective was to explore and prototype what a well-governed city might look like in 2030 pertaining to the role of data and how GCC could support greater citizen-centric decision-making, a panel of expert stakeholders were invited to speak on the key community challenges in Glasgow. This included a community engagement officer, a corporate service reform manager, a digital officer, a cancer-care expert, and a city development planner; key project stakeholders who were consulted through the project. Following the launch day, the student-graduate team immersed themselves in a period of desk research in the studio as well as engaging in site visits to observe community council meetings and interviewed a range of expert stakeholders. Over the course of Phase 01, the research was iteratively layered upon as the student-graduate team worked in a process of collective sense-making. This included moving between insights, interview transcripts and photographs that were physically tangible (see Figure 2), to digitally translating these into a shared online data bank. Here a process of thematic analysis and mapping took place and led to the construction of, what the student-graduate team referred to as, *knowledge landscapes* (see Figure 3). As the topic of the brief remained broad in Phase 01, this cyclical process was described by the team as intuitive and tacit in nature, whereby a “feely-ness” was needed when “swimming” in the research. The landscapes were shared with and contributed to by the GCC team, which became an online platform for exchanging ideas and knowledge between the teams. However, when reflecting on efficacy of this distributed way of collaborating, the student-graduate team highlighted the challenges of managing the virtual working space, with the need to often sift through and filter out content so to demarcate key lines of inquiry.

Figure 2. 2020. Collected Insights, Interview Transcripts and Photographs.

Figure 3. 2020. An Example of a Digital Knowledge Landscape.

4.2 Developing: design knowledge artefacts

During Phase 02, an additional cycle was introduced into the process in the form of synthesising and, as described by the student-graduates, “re-physicalising” the knowledge landscapes. One form this took was the first iteration of the Research Cards. The cards were used in subsequent workshops with the GCC team as a baseline to measure emerging insights against and to finally frame the project through the over-arching lens of *data*, *governance* and *citizenship* (see Figure 4). Another form this took was the development of designed artefacts to materialise the research into a tangible world with four neighbourhoods, each containing a range of prototyped objects that critically personified the neighbourhood themes. These artefacts were used to facilitate a co-design workshop with both teams, which become a key cornerstone in the project. Reflecting on this workshop in particular, the student-graduate team recalled how the artefacts themselves, in their unfinished form, were able to scaffold collaboration and a coalescence of ideas and consensus across the teams. Up until this point, the student-graduates had observed how the highly explorative and emergent nature of the project and studio-based working differed to the other team’s working practices; reflecting on the need to align expectations around, as described by the student-graduates, “embracing ambiguity”.

Figure 4. 2020. Research Cards and Co-designing the Landscapes.

Phase 03 centred on collecting primary research through the design and delivery of two workshops where the student-graduate team engaged with groups of citizens and expert stakeholders. The aim of the workshops was to explore with participants this future world, with activities framed around, as described by the student-graduates, “collective

envisioning". The knowledge artefacts developed in the previous phase were translated into a suite of workshop engagement tools. This included artefacts to enable participants to be metaphorically transported to the future neighbourhoods, where they could explore and reflect upon their values, fears and desires for the future of citizenship, modes of governance and data experiences, as well as explore their own ideas of a preferable futures (see Figure 5). The student-graduate team translated their research into a selection of tokens to connote, for example, data use in decision-making, digital applications, working practices, trust and perceptions of governance, and community participation. Participants were asked to build a picture of their values by choosing tokens that resonated with their present-day self. At the end of the workshop, the participants were invited to re-visit their pictures to reconstruct a 2030 vision of themselves. Following the picture-building activity, the participants explored each neighbourhood with the student-graduate team, facilitated by the use of design artefacts and narratives that embodied key tenets. As an example, in one neighbourhood narrative, citizen's emotional reactions are passively monitored by the council through skin micro-chips, a future concept that was role-played in the workshop by giving each participant a medical bandage to wear that had a chip (taken from the inside of a subway ticket) attached to it.

Figure 5. 2020. Workshop Engagement Tools.

Evaluating the workshop activities and their future-focused nature, the student-graduate team reflected on the participants' readiness to engage in speculative imagining and ideation. In some cases, the envisioned neighbourhoods, whilst based on collected evidence, were experienced as too far removed from reality for the participants to relate to or see as plausible. Or, conversely, in some cases participants found the neighbourhoods to be too close to reality and struggled to look beyond the present-day. Reflecting on the role of the

engagement tools as conduits to support the participants to suspend their disbelief, the student-graduates described the need for the tools to be more performative, sensory and "visceral" – so to provide participants with an immersive and empathic experience that could enable them to transcend their assumptions, perceptions, and boundaries of the present day.

4.3 Delivery: Glasgow 2030

Returning to the studio, the student-graduate team spent time analysing insights from the workshops, and, in collaboration with the GCC team, distilled these down into three core themes: *understanding data through citizens' experiences*, *data inequalities*, and *value exchange*. These themes were used as propositions in the final iterations of the neighbourhoods (see Figures 6). Within each neighbourhood belongs a suite of citizens who engage in a series of scenarios – knowledge artefacts used to communicate potential future narratives of Glasgow 2030.

The first neighbourhood was *Choicetoun*, which explored the theme of understanding data through citizens' experiences, where the council maps citizens using data from multiple sources and various methods of engagement. With *Choicetoun*, the council has resources and a database to analyse streams of data using a range of tools but allows people to have control in designing their level and mode of engagement and have the choice of what data to input. The second neighbourhood, *Localtoun,* explored the theme of data inequalities and the proposition of the council supporting citizens to take on more responsibility for their neighbourhoods through making data more transparent. Within this neighborhood and citizen narratives, the student-graduate team explored decentralised decision-making, and how citizens could be empowered by data. The third neighbourhood, *Efficiencity*, explored the theme of value exchange, where data has become a conduit between citizens and the council facilitated through online interactions and AI technologies in the home.

Figure 6. 2020. The Final Project Outcome: the three neighbourhoods and citizens of Glasgow 2030.

In summary, this Collaborative Futures case study evidences the emergent nature of a live collaborative project, and highlights challenges faced by the student-graduate team in terms employing future-focused and speculative design approaches. In the next section the authors discuss their insights surrounding the relational and experiential proximity of collaboration and the role of design artefacts, drawing on CoP and Boundary Object theory.

5.0 Discussion

In this section the authors discuss their key insights pertaining to the collaborative design culture fostered in the project and the future-focused outcomes – theoretically unpacking the value, impact and challenges of collaboration and the role of design knowledge artefacts. Returning to the underpinning research questions (see section 3.0) and based on the student-graduates' own recommendations, the authors reflect on the implications and value these insights have for the pedagogical model for delivering future-focused, citizen-centred design education.

5.1 Relational Proximity: cross-cultural collaboration

Reflecting on the relational proximity of collaboration, various forms and degrees of collaboration took place in this project – between the student-graduate team, between the student-graduate and GCC teams, and between the student-graduate team and the participants (which the authors will return to in section 5.2). Establishing a culture of social

learning within the studio-based context is a fundamental aspect of the project. However, and as evidenced in the case study, challenges emerged in sustaining this across the two teams. As reflected on by the student-graduate team, the relational proximity of collaboration was both geographical (as, for the most part, the two teams were based at different locations) and occupational in terms of understanding the value, conventions and structures of each other's working practices. Based on their shared educational experiences at GSA, the student-graduates have collectively developed a repertoire and instinct for handling the emergent, and often ambiguous, nature of an inductive project. Whilst this project's approach held a level of familiarity to the student-graduate team, this intuitive and shared understanding, at times, assumed a similar level of connection with the partner team, taking for granted that this was the partner's first time in engaging with this project.

Furthermore, the internal working structures of the two teams seemed to differ. Whilst the industry partner appeared more traditional in terms of defining roles and responsibilities, the student-graduates' was less hierarchical, enabling members to test out roles, rotate positions and work more freely together. When the two teams came together, usually in the format of a workshop, these factors could either lead to lively debate or inertia. It seemed that the project had brought together two diverse communities of practice, whose practices often remained independent as opposed to inter-dependant of one other. Over time, however, a shared project language became equally used by both teams as key deliverables began to materialise. This exchange of knowledge and adoption of language aligns with Wenger's theory of CoP and how boundaries of discrete communities can begin to cross and permeate each other through a process of brokering (1998: 105). As proposed by the student-graduates in their Design Recommendations, designing in mechanisms early on in the project to articulate and demonstrate to the partnering team the value of embracing ambiguity could have incited more meaningful collaboration. As a learning opportunity, the student-graduates recognised the potential benefits of designing a cross-team ice-breaker session at the start of the project as a way to unionise the two CoPs from the offset. Here individual working practices and assets, as well as anxieties, could be raised and externalised; and, based on these, a project trajectory could be negotiated and mapped out together so to align expectations more effectively.

5.2 Experiential Proximity: knowledge artefacts

The authors will now unpack the brokering role the design knowledge artefacts played as tools for engagement with the project participants, discussing the experiential proximity of speculative, future-focused co-envisioning by drawing on Boundary Object theory (Star & Griesemer, 1989). As set out in the case study, the engagement workshops brought together groups of citizens to critically reflect on their experiences and values based on the themes of citizenship, governance and data. The engagement tools were designed to support the

participants to test out their assumptions and to bridge these futures so to reflect on the present. Across the workshops, various degrees of participation took place, evidenced in how the participants were able to connect with, or not, to the future narratives and propositions contained within them. A key challenge highlighted by the student-graduate team was the provocative nature of the tools, which, in some cases acted as metaphorical vehicles to transport participants into the future, and in other cases became road-blocks.

As each participant brought with them their own latent subjectivities, the student-graduates had designed the tools with the aim of being generally understood by the wider workshop group as well as being reflexively interpreted on an individual basis by each participant – characteristic of Boundary Objects. The tools were most effective when they supported participants to go beyond how these narratives pertained to their own life-worlds, to explore as a group inter-subjective envisioning for the future. However, the student-graduates described the challenges of presenting new "variations on reality", suggesting that participants seemed less engaged in narratives proposing changes to intangible structures (such as alternative economies or societal models), as opposed to more tangible forms (such as technological devices and digital applications). In conversation with the student-graduates, they identified several short-comings in their workshop design and the degree to which the tools could facilitate a meaningfully experience for the participants in parallel to gathering rich research insights. In particular, whilst the tools acted as a form of consciousness-raising, they were limited in supporting more radical forms of speculation. The student-graduates recognised that suspending disbelief needed to be carefully calibrated as, in some cases, the tools asked participants to engage with narratives that were either too close to present-day phenomena or, conversely, too far removed from their realities to be conceivable. The tools were having to not only mediate the metaphorical proximity between present and future, but also between the believable and mythical.

5.3 Key Learnings for the Pedagogical Model

This iteration of Collaborative Futures has raised valuable insights that will inform the underpinning pedagogical model for future delivery in terms of how cross-cultural collaboration is set up and then sustained as a project unfolds; mechanisms to support cross-team knowledge and skills exchange; and the role design knowledge artefacts play in facilitating participation. Returning to the underpinning research question (as set out in 3.0), as a learning experience, it provided the student-graduates with the opportunity to engage in interdisciplinary collaboration with an external professional team, stakeholders and participants. Furthermore, it was equally an opportunity for them to build upon their design practice through undertaking a design-research process to future-cast the experience, needs and opportunities of Glasgow's citizens in 2030. A key area for future research is to track, measure and evaluate the impact of the project outputs in terms of informing GCC's future

work, and if and how they plan to adopt the proposed design directions presented by the student-graduates. Furthermore, the authors observed the development and confidence of the student-graduates' own critical voice – through prototyping, testing and evaluating their design approaches – arguably developing student-led contributions to the field of Design Innovation. Thus, this iteration of the pedagogical model fostered both deeply methodological learning as well as contextual learning. A future opportunity to extend professional practice as a learning outcome is to explore the potential of supporting the student-graduates to theoretically unpack their insights, which for them often felt tacit in nature, and mentor them in authoring their own academic outputs.

6.0 Conclusion

To conclude, the aim of this paper was to evidence the authors' key learnings for delivering future-focused and citizen-centred design education, drawing on Collaborative Futures as a case study. Framed around the themes of relational and experiential proximity, and drawing on theories of CoP and Boundary Objects, the authors have reflected on the challenges surrounding cross-cultural collaboration and employing speculative design approaches in a live project. As a transferable pedagogical model, the authors argue that this studio-based, phased project approach elevated the student-graduates' design and professional practice by developing their research skills, teamwork, capabilities in creatively engaging participants, and nurturing their criticality in evaluating their design approaches. So to position this model within the wider design pedagogical landscape, and whilst out with the scope of this paper to more fully explore, in future research the authors seek to further document and evidence the value and impact of Collaborative Futures (the next iteration taking place 2020-2021), in parallel to undertaking a comparative analysis of the previous iterations (building on the work of Ross, 2018) as well as researching models being delivered by other higher institutions.

Abstract | This research addresses the role of children in society as key players able in the next future to influence adults' behavior as ambassadors of good causes.
The main objective is to propose an innovative approach to design products to be used by children in public spaces. These communication products have to improve children's experience, facilitating social inclusion and cultural education on social and sustainable issues and local and territorial values. According to the sustainability point of view, the design solutions might teach children to respect people and the environment and take care of local tradition and culture to pass on in the future. Moreover, this paper intends to individuate open rules that could help designers, professionals, and authorities to work together to involve young people as active citizens of the future.

KEYWORDS | CHILDREN, PUBLIC SPACES, COMMUNICATION DESIGN, INCLUSION, CULTURAL VALUES

1. Introduction

1.1. Children: learning “good practices”

Since birth, the child is naturally curious; he observes and interacts with everything around him. He learns new practices and values through various experiences and activities using communication tools suitable for his psycho-physical and emotional development. Furthermore, children have an unstoppable need to experiment and learn, and adults represent their main point of reference. At the same time, the adult learns from the child; as a matter of fact, often the child becomes a little ambassador of "good practices" and sustainable behaviors that he has had the opportunity to experience, for example, at school, where he spends most of his daily time. In this sense, the child can even change the behaviors and habits of other children and parents, and adults in general.

School and education are decisive in transmitting acceptable practices and values, as listed in the "National Indications for the nursery school and first cycle curriculum". Already from the early years of school, the child learns the first behavioral rules to promote the development of identity, autonomy, and competence to start them towards the concept of citizenship (Ministero dell'Istruzione, 2012). A school with this approach allows the child to grow up in a recognizable pedagogical environment, where he can understand what surrounds him, learning both social and cultural values. The same document aims to promote and consolidate children's necessary cultural skills. Making our culture known to the younger means knowing values and learning more advanced and not limited knowledge. Although the ministerial indications refer to the school environment, it is possible to apply these indications to other areas. Even living places, as shown (Montessori 1970), have considerable influence on the people's behaviors and, therefore, children.

As a consequence, it is essential that even public and collective places where children spend their time could be designed in such a way to reproduce the same acceptable practices and knowledge that children have experienced in the protected and safe educational places, such as at school. In this way, they have the opportunity to consolidate and test their knowledge, learn to use it, and apply it daily in order to develop civic awareness and respect for places and people. In truth, the practice of learning by doing (Dewey, 2008) is the best-known method of learning widely used.

Therefore, the research focused on public and collective spaces in the urban environment and sought to identify graphic elements, tangible and digital products capable of connoting collective spaces by creating experiences and interactions. These aim to make children more respectful of people's environment, and be aware of social issues, inducing collaborative behavior respecting rules. This purpose follows the "National indications and new scenarios", "*citizenship education is promoted through meaningful experiences allowing to learn concrete taking care of oneself, others and of the environment encouraging forms of cooperation and solidarity*" (Ministero dell'Istruzione, 2012).

1.2 Children rights and participative research.

The ONU Children Rights Agreement, signed in 1989 for the first time in history, established references and guidelines for sustainable development of "children centered" cities. The agreement took effect on 2nd September 1990, and it was deposited in ONU on 5th September 1991. To date, the convention is in force in 196 States. The document describes, through 54 articles, the economic, social, and cultural rights of children.

This agreement profoundly changed the way to consider and respect children in society. Successively the concept of "children participation" in social life was introduced, and thanking this, the child became an active part of the community.

"Designer must be a good citizen and participate in the shaping of our government and society. As designers, we can use our particular talents and skills to encourage others to wake up and participate as well".

(Katherine McCoy, 2003)

In the last couple of decades, the design research got closer and closer to the user. As a result, the term "co-design" was born during the early 1970s (Stalberg, Sandberg, Soderback, & Larsson, 2016). Designing together with users means involving final users and their creativity in the design process (Sanders & Stappers, 2008). The participative approach is a central tool in the design research because it allows understanding the impact that a given project could have on the community and how the actors interact in the scenario. It is necessary to develop a project for the community working together with the community to make it feel "owner" of its places.

Symbolic values and social relationships always qualify the space. To understand the needs of a specific space, it is not enough to observe the different users; above all, it is necessary to dialogue and work together with them. As users of a place, children represent the determining factors to involve in a design process to reach sustainable solutions. Although referring to children, the ministerial guidelines refer only to the school environment, it is possible to apply the same concepts to different public spaces in which the child lives, and he can learn good practices and social values such as inclusion and respect for the environment.

During the last years, designers have realized that children can be viewed as essential participants with valuable knowledge and experiences. Nowadays, society more and more considers children's needs even if it was mainly adult-centered until a few years ago.

In order to design according to a child-centered approach, it is evident and necessary to involve little users in the design process. The co-design is a method useful to make children active social actors. Children can communicate in many different ways, and they are capable of influencing people with whom they interact, becoming vehicles for the transmission of good practices and social values. The territory and the cities should be emotional and interesting places for children to feel safe and at ease. According to this point of view,

children should easily enjoy public spaces because they are designed to consider their needs (Giraldi, L., Benelli, E., Vita, R., Patti, I., Filieri, J., Filippi, F. 2017).

Concerning this perspective, in fact, in Italy's last decade, the awareness of children's social importance increasingly spread. Therefore, in the design of public and private indoor and outdoor spaces, more and more attention is paid to children and family needs to improve as much as possible the experience in the environment.

In Italy, article n. 7 of the Law n. 285/97 provides measures and interventions aimed at promoting the participation of children and adolescents in local communities life through actions that facilitate the use of urban and natural spaces, removing obstacles to mobility, spreading the use of environmental, cultural, sports and social goods and related services. Since 1996, these themes have been developing by the Ministry of the Environment to promote the Sustainable Cities of Girls and Boys Project, to encourage a new childhood culture based on the important assumption: a "children centered city" is more suitable for everyone. The participation of children and adolescents is essential in creating projects for the urban environment. This one designed for and with children is better for the whole community and are an enrichment for the society.

The participative approach with children is widely used in designing a public place, especially in northern Europe, even if it is quite used as a design method and Italy, starting from the last years. A very interesting case study of participative research with children is the "Design for Outdoor spaces" project, carried out in Rotterdam (Holland) in 2016. The project aimed to design strategic solutions to be included in the outdoor public spaces of a defined neighborhood to create open rules applicable to different collective spaces. The research highlighted some guidelines to design strategic solutions to improve the security and the usability of neighborhood public spaces where children usually spend their free time.

2. The aim of the research

This research aims to propose a new approach in designing communicative products for children belonging to different cultures to be used in public spaces of various urban scenarios. These kinds of products have to improve children’s qualities of experience facilitating their relationship and cultural education on social and sustainable issues and, at the same time, on local and territorial values.

According to this previous statement, the research aims to individuate a series of open rules as a concrete referring tool available to be used by designers, public authorities, and professionals for different designing purposes and taking into account a multi-cultural language.

All the products designed following these open rules will have in common the capability of easily interacting with children communicating them with a different kind of practical and intangible information and at the same time exiting them in a pleasant way. These design

solutions have also to teach children to respect people and the environment, taking into account local culture and traditions to pass on in the future according to the sustainability point of view.

Consequently, the research proposes a new collaborative approach in designing for public spaces to integrate practical information, and intangible social and cultural values in pleasant emotional experiences, improving awareness among children helping them learn values.

Moreover, this work highlights the strategic role of design and communication, able to pass on practices and intangible values suggesting behaviors, relations, and interactions among young people and places, making them familiar and engaging them as active citizens of the future.

3. Methodology

The design research used a transdisciplinary approach to believe that solutions depend on the wise evaluation and analysis of all possible factors connected to the problems and related to the kind of main users in specific contexts.

Nowadays, children spend most of their life outside the home by living in outdoor or indoor public spaces. During this long everyday time, they live meeting and socializing with the others. Even if their experiences could be very different according to many factors, all the children have in common a series of recurrent needs.

Starting from these considerations, the design research follows a transdisciplinary method involving many disciplines as pedagogy, cognitive perception, education, economic, history, engineering. Besides, the design used the Human-Centered Design (HCD) approach and the co-working method to involve different actors, including children as main users in the design processes.

Allison Druin adapted the participatory design theory to suit children to have their direct input, thoughts, and feedback in the design process (Druin, 1998). According to the author, children can be involved in the design process in four different ways: a user, a tester, an informant, and a design partner (Druin 2002). Furthermore, Iversen, Smith, and Dindler also identified the role of "protagonist," according to this role, children have much more power during the design process (Iversen et al., 2017).

Lastly, Fenne Van Doorn theorized that, during the design process, children should have the task of "co-researcher." As a consequence, children are both researchers and final users (Doorn, 2016).

During the co-working activity, some important factors should be considered, such as children's age (Piaget,1970), the environment, and the activity itself. Because children's'

abilities and skills change according to their age, it is necessary to choose the type of activity suited to the characteristics of children involved and related to the final goals.

The environment is the second factor to take into consideration the success of the activity. For this reason, the choice of well-known places such as, for instance, schools may be reasonable, so that the child feels at ease during the activity.

Referring to the kind of activity as the third factor, low-tech methods, such as paper, clay, Lego, and crayons, represent a good practice to encourage all kinds of children to communicate according to Druin's theory. Moreover, during workshop activities, it is important not to judge the children; thus, they can feel free to express themselves.

Finally, the co-working activity should be ludic to entertain pleasantly and, at the same time, should make the child responsible for the project. Besides, the co-working activities with young people result strategically also for underlining the connections among children, behaviors, and emotions during a life experience in public spaces. The co-working approach has experimented with as described below during the development of the present work.

Due to the broad context of reference and different experiences, the research analyses children's behaviors and needs from the referring literature and through different activities with children 7-11 years old.

Reggio children approach (Edwards & Gandini & Forman, 1993), Montessori (Montessori, 1970), and Piaget (Piaget, 1970) gave us the basic referring theories on children's skills, needs, and behaviors at different ages and information on their psychophysical and cognitive development.

3.1 Applied method

The research has been divided into two main phases, and each one has implemented different kinds of activities.

The first phase was carried out involving two classes of children (from 8 to 10 years old) at Gianni Rodari primary school in Florence.

The activity concerned direct observations of children in different contexts, then it concerned co-working activities with young people. The co-working activities were found strategic not only for the contributions to the design research but also for underlining the relations among children, behaviors, and emotions during a life experience in public spaces. All the scheduled activities have experimented with as described below during the development of the present research.

1. Direct observations. The direct observation aimed to identify children's behaviors and needs during free time activities at the public garden near the school, including their walk along pedestrian paths (about 500 meters) between the school and the public garden and vice versa.

2. Co-working activities. Children were asked to describe and draw what they would expect to find on the path walk and at gardens to feel safe and autonomous from adults during an outdoor activity. Moreover, they had to indicate what could help them to live their experience pleasantly.

Besides, they had to describe in a few words what they would like to find in the gardens to play in security and make friends with other children also belonging to other cultures. During the activity, a special focus was devoted to the best methods to communicate and pass on local habits and traditions to children to make them understandable and applicable. In this way, one should unconsciously educate to respect the environment and to build a civic conscience, creating a sense of belonging to a place. Finally, they were invited to draw their ideal public space. During the activities, the children were supported by experts such as teachers, pedagogists, cognitive psychologists, and designers. The activities lasted for about two months.

The second phase of the experimentation activities was carried out with fifty students of the master design course at the University of Florence. The activity's object was to design strategic solutions, such as material and digital products, graphics, wayfinding systems, and services, to be easily used and understood by 7-11 years old children. The requested projects aimed to improve children's experience in public spaces, suggesting them good practices in relation to the respect of social values, environment, local culture, inclusion, and a more sustainable future.

The activities with students were structured into two steps and lasted for about five months. During the first step, students were asked to study children (7-11 years old) needs and behaviors concerning their psycho-physical development. During this step, they were supported by pedagogists and psychologists. Moreover, they investigated children's products and collective and public spaces dedicated to children or children used to visit. Finally, they studied the participatory approach and co-working as design methods, referring to significant examples.

Following these theoretical studies, students designed the "concept of products" for children to be used in collective spaces according to the set goals. The material and immaterial "concepts" aim to make the new generations more satisfied with their experience in collective public spaces.

During the design process, some of the students directly interfaced with associations and local authorities of the involved territory to use new solutions to welcome children in public spaces.

During the workshop, young designers proposed design solutions to be included or used in outdoor and indoor public collective spaces, which could teach children good practices regarding the context of reference. In particular, the proposals aimed, on the one hand, to make the child responsible for the place itself and, on the other, to encourage them to relate

to each other. In the proposals, the child becomes the essential active element in the place. Through some of the proposed experience, the child actively respects the environment by taking care of the plants.

4. Results

The design research process started from a transdisciplinary approach, involving various disciplines collecting different knowhow with the same final goal.

This approach believes in an essential exchange of techniques, methodologies, and know-how towards innovative design research. In particular, this method allowed us to find innovative solutions to educate children, communicating them with good practices related to passing on local values, respecting the environment, and including people in public and collective spaces.

According to these aforementioned purposes, designers should take into account the following design solutions using design elements for public/collective spaces:

- Orientation elements. Children need recognizable elements to guide their behaviors, feeling themselves at ease also outside familiar such as iconic graphics and pictograms, indicator signs, minimal use of words, simple, colorful shapes, and use of primary colors. All the products have to be placed on the decking and at a height not exceeding 1,2 meters.
- Information elements about practical and immaterial topics, such as iconic and symbolic signs, minimal use of sentences, illustrations. Children need to clearly understand all the rules to respect and good behavioral practice to act in public spaces. Moreover, these kinds of products are responsible for passing on local values and traditions, contributing to improving all the children's knowledge.
- Entertainment elements. The use of ludic and experiencing elements, as signs, texture tiles, interactive screens, and park equipment, allows children to interact with fun.
- Emotional elements: Multipurpose elements made of different colors, shapes, textures, functions, and materials allow for stimulating the child's creativity and imagination, making the environment reassuring and engaging through their synesthetic involvement.
- Inclusive elements: capable of improving collaboration among children, sharing of values and emotions, facilitating relationships, and welcoming of all kinds of children. These elements should have undefined shapes, capable of being interpreted by children according to their culture and origin.

All the above solutions can influence children and their behavior. They result strategic in designing products to be used in public and common spaces, and in all places where these goals are primarily.

In conclusion, the research aims to improve children's educational experience on important themes of inclusion, respect for the environment, sustainability, and cultural and traditional values. This research identified a set of open rules to design products to identify and render public and collective spaces children centered. The final purpose aims to improve children's educational experience on important themes of inclusion, respect for the environment, sustainability, cultural and traditional values. The research underlines that all the material and digital elements inside public and collective places determine children's living experience.

The more these elements result familiar and recognizable, the more the experience will be friendly and amusing, thus improving children's education and growth. According to this consideration, children's experience inside this kind of public space becomes a pleasant training for their future life. In summary, the research results point out that design solutions have a decisive influence on people's quality of life and particularly on children inside collective places. For the future, we hope that these design inputs could be of inspiration and advice for designers, researchers, public authorities, and professionals for the design of collaborative child-friendly environments. Moreover, the proposed design approach based on children's needs trains the community to be more proactive and explore new solutions to solve future problems. Finally, we would like to share these results in order to apply and to develop the proposed open rules for designing not only public spaces but also all kind of living collective places in order to diffuse the "children-centered" design approach.

Creating an inclusive learning environment to support transformative learning and encourage upward educational mobility opportunities for economically or academically under-resourced design students

Michal Rotberg, GD MFA

Department of Film & Digital Production,
Miami Dade College, Miami, Florida, USA
mrotberg@mica.edu

Abstract | While select students are groomed within design-driven learning environments, exposed daily to forward-thinking practices, many of their less fortunate counterparts lack the means or acumen to access those resources. The emphasis on inclusivity in the field of graphic design education assumes even greater importance in institutions serving economically or academically under-resourced students such as junior colleges, tribal colleges, and many other public institutions. This paper presents modifications to graphic design foundation courses developed to meet the needs of students whose educational, cultural, social, or economic situations hinder their educational process and make it hard to pursue their educational and professional goals. It is a portfolio of tools adaptable to different levels of preparedness that supports transformative learning and develops self-efficacy in students, along with a solid baseline in critical thinking, design processes, and technical capabilities. The goal is to support and encourage upward educational mobility opportunities for such students.

KEYWORDS | INCLUSIVE LEARNING ENVIRONMENT, EMPATHETIC CLASSROOM, STUDENT-CENTERED DESIGN EDUCATION, UPWARD EDUCATIONAL MOBILITY, TRANSFORMATIVE LEARNING ENVIRONMENT

1. Introduction: The journey of growth for economically or academically under-resourced students

New data published by The Brookings Institution indicates that in the USA only 46% of students from low-income households enroll in four-year institutions (Reber, Sinclair, Van Drie, 2020). At the same time, more localized research based on data from the state of Georgia, USA estimates that four-year-university students show a 20% household income growth by the age of 30 (Smith, Goodman, Hurwitz, p. 1). In reality, the journey of economic growth and mobility may be much more complicated and often can feel unsurpassable to economically or academically under-resourced students, especially in the field of graphic design, since it may not be commonly represented or supported within their social circle. City and community (junior) colleges provide a necessary opportunity for "(41 percent) of all postsecondary students (especially low-income and underrepresented students)" (P. Loprest, C. Hyman, 2018 p. 4) to obtain the credentials and knowledge base for transferring to four-year-institutions. These programs play an instrumental role in educating economically or academically under-resourced design students.

Students who come to junior colleges often have many exhausting responsibilities in addition to their studies, such as working more than one job to support their families, taking care of siblings or relatives, and having parental responsibilities. In addition, they may have limiting living conditions, access to food, technology, and medical care.

Many such students may also be underprepared. In 2016, for example, two-thirds of students came to community colleges not ready for college level work (CCCSE National Report, 2016 p.2). Therefore, maintaining an inclusive and empathetic learning environment that supports transformative learning practices and develops self-efficacy at the institutions and programs serving those students is very important.

1.1 Why this article

The design field today presents different types of challenges and opportunities. If only for this reason, we need different types of designers. We need designers who understand and practice diversity, and who possess diverse education and skills. As much as new designers should be ready to uphold the mantle of social and environmental responsibility that comes with this multifaceted occupation, they should also "share a core set of fundamental principles that sets it[design] apart …" (M.W. Meyera D. Norman, 2020 p. 14)

While select students are groomed within a design-driven atmosphere, exposed daily to the most forward-thinking design practices, their counterparts from under-resourced communities lack the means or acumen to access the same resources. These young designers often graduate before they are ready to take on responsible roles in shaping sustainable and formative systems for our future.

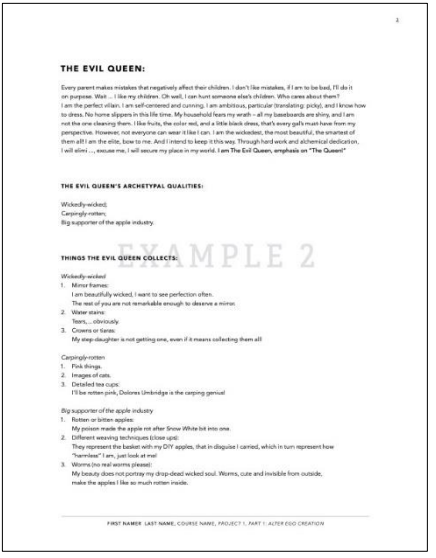
Under the weight of current global issues that affect everyone, as well as specific local issues amplified by the global pandemic, the need for change in the educational system, and design education specifically, has become imminently necessary. While Meyera and Norman, in general, call for "a program to move the design profession capable of fully realizing the value of design in the 21st century"(M.W. Meyera D. Norman, 2020, Highlights), the author hopes for a program that will specifically address the needs of students from underrepresented, vulnerable, or under-resourced areas and communities.

This article arises from the author's own experience teaching a demographic that includes academically underprepared students, students from different linguistic backgrounds, first generation students, and students with financial, personal, medical, or other hardships. These students' needs often go unmet within a typical design program because of their circumstances. This is why in her own classroom the author adjusts the program to fit those students specifically. That said, the challenge of serving students with needs arising from generations of disadvantage can be found in classrooms all over the world.

2. Methodology

The following are the methods the author currently uses to help students develop a solid baseline in critical thinking, design processes, and technical capabilities. This educational model aims to support transformative learning and develop self-efficacy. The goals of this effort are to assist and encourage educational mobility opportunities and help provide a clear pathway to a four-year-institution for students.

This adaptable portfolio includes the following educational methods: building on strength, developing professional awareness (the tactical consideration mindset), spiral course structure and content integration, no failure grading systems, tools to solidify general, cultural, and professional development, and other techniques such as progress grades, checklists, in-class and online collaboration assignments, lead-ins to facilitate constructive critique, design vocabulary and other practical resources, and extracurricular opportunities within the design classroom.



3. Building on strength: first projects should showcase students' natural talents and abilities

Since the skill range within one classroom may vary greatly, it is best to start a course with a short assignment that requires students to experiment with their skills, like an image making project. The goal is to allow each student to discover what design skills they are good at and then develop them further. After deciding which skillset to use, students can start a slow burn project (semester or half-a-semester-long) that relies on those skills. This project should only require thirty to forty minutes a week, so students have time to work on other

shorter assignments. Such a project creates the opportunity for students to utilize their best talents on a weekly basis, supporting their efforts in other areas of the program that might not be as easy or emotionally fulfilling yet. This method encourages students to deepen their perception of design, evaluate their own talents, and imagine their future within such a broad discipline from the get-go.

3. 1. Example:

My Alter Ego's Collection of Great Stuff. In this project, students are asked to select a style of image creation that showcases their strength and reflects their personality. The *Alter Ego* approach to the repetitive task of creating images in a selected style makes said task more interesting, and inspires students to create unique and thoughtful processes. It teaches them to follow a design process, pay attention to details, regard the project description carefully (it is the *Alter Ego,* not the student, who chooses the style, so the style should reflect the "author"), and curate their work for their final presentation. A semester long collection project is sometimes issued in traditional design schools in the United States. However, in a shorter junior-college level program, it is more difficult because of the time constraints. In a course that aims to prepare students with a wide range of abilities and skills, such a project serves as the glue for otherwise smaller and more technical assignments that students work on to advance their understanding and command of graphic design principles.

THE EVIL QUEEN:

Every parent makes mistakes that negatively affect their children. I don't like mistakes, if I am to be bad, I'll do it on purpose. Wait ... I like my children. Oh well, I can hunt someone else's children. Who cares about them? I am the perfect villain. I am self-centered and cunning. I am ambitious, particular (translating: picky), and I know how to dress. No home slippers in this life time. My household fears my wrath – all my baseboards are shiny, and I am not the one cleaning them. I like fruits, the color red, and a little black dress, that's every girl's must-have from my perspective. However, not everyone can wear it like I can. I am the wickedest, the most beautiful, the smartest of them all! I am the elite, bow to me. And I intend to keep it this way. Through hard work and alchemical dedication, I will elimi ..., excuse me, I will secure my place in my world. I am **The Evil Queen, emphasis on "The Queen!"**

THE EVIL QUEEN'S ARCHETYPAL QUALITIES:

Wickedly-wicked;
Carpingly-rotten;
Big supporter of the apple industry.

EXAMPLE 2

THINGS THE EVIL QUEEN COLLECTS:

Wickedly-wicked
1. Mirror frames:
   I am beautifully wicked, I want to see perfection often.
   The rest of you are not remarkable enough to deserve a mirror.
2. Water stains:
   Tears,... obviously.
3. Crowns or tiaras:
   My step-daughter is not getting one, even if it means collecting them all!

Carpingly-rotten
1. Pink things.
2. Images of cats.
3. Detailed tea cups:
   I'll be rotten pink, Dolores Umbridge is the carping genius!

Big supporter of the apple industry
1. Rotten or bitten apples:
   My poison made the apple rot after Snow White bit into one.
2. Different weaving techniques (close up):
   They represent the basket with my DIY apples, that in disguise I carried, which in turn represent how "harmless" I am, just look at me!
3. Worms (no real worms please):
   My beauty does not portray my drop-dead wicked soul. Worms, cute and invisible from outside, make the apples I like so much rotten inside.

FIRST NAME LAST NAME, COURSE NAME, PROJECT 1, PART 1: ALTER EGO CREATION

Figure 1. My Alter Ego's Collection of Great Stuff project, part 1, an OC (original character) creation, Alter Ego OC example: The Evil Queen.

3. 2. Reflection:

When students discover that they can produce quality work through careful analysis and thoughtful use of their existing talents, they learn to continue developing those talents and start looking at the world with a designer's eye. They tend to dig deeper into the program, discovering new interests and actively striving to develop their skills; they also learn to productively utilize them. They better identify the weaker areas in their own work. This method helps students to see their own worth as designers. From the author's experience, the *Building on Strength* approach is especially helpful for design students who begin their journey from an academically disadvantaged position to become capable professionals.

4. Developing professional awareness: the tactical consideration mindset

The vocabulary used in the classroom to discuss personal qualities, talents, abilities, advantages, and disadvantages is constructive and optimistic. It is essential for the students to develop their ability to recognize and acknowledge their own weaknesses. This is done through positive reinforcement and encouragement, as well as using a proactive and optimistic vocabulary that fosters professional and personal growth. Phrases like *'tactical*

consideration' help students understand that there is something that needs to be re-evaluated, but they also teach students that all those 'considerations' are a part of every professional designer's process, and such critique does not have any negative connotation. In a non-judgmental atmosphere, with the help of educational materials based on their particular needs, the students easily learn to take the actionable steps needed to address different challenges.

4. 1. Example:

A student is not schooled in academic drawing techniques, but unconsciously creates images in a style similar to works of primitivism. When this student is encouraged to develop their unique style of illustration, they begin to apply their newly acquired theoretical knowledge and compositional skills while effectively evoking elements of primitivism in their visual interpretations. As a result, this student's interest in their work increases, their projects are of higher quality than before, and they learn to embrace their personal style.

4. 2. Reflection:

Searching for possibilities hidden within students' own work, emphasizing them, and developing them into growth opportunities alleviates comparison anxiety and teaches students healthy critique strategies. When students receive positive guidance in strengthening their talents, unrelated to their level of preparedness, abilities, or aspirations, they begin paying attention to their weaknesses as well. However, they concentrate on the positive aspects of learning. They understand the value of their own work rather than comparing their work to the work of others, which expedites students' academic and creative development. This method teaches students some elements of design thinking and human-centered design.

5. Spiral progression and content integration

Usually the spiral approach is best employed as a long-term educational process. However, the timeframe and circumstances discussed in this article do not allow for that. Although there is no clear empirical evidence for the effectiveness of a spiral based curriculum (J. Howard, 2012, p.1), due to its nature, the spiral structure of learning process improves Transfer During Learning and Transfer of Learning (D. Sousa, 2012) directly by reinforcing and refreshing the understanding of concepts, gradually introducing complexity in a shorter period of time (a single course) *(Figure 2).* If combined with some elements of content integration, a spiral progression prepares students for a four-year institution. Transfer processes, according to the neuroscientific education theory, allow the brain to reorganize itself upon receiving new stimuli. The student's brain discovers new connections between old and new knowledge, leading to creation of new networks and patterns of thought and action, thus "add[ing] beauty and clarity and… forge[ing] isolated ideas into spectacular

visions." (D. Sousa, 2012). By integrating related materials from other disciplines and courses to a graphic design foundation course, the author builds on the transfer abilities of the brain (D. Sousa, 2012). For students dealing with the challenges described at the beginning of this paper (1.1), spiral progression and content integration can alleviate stressors like fear of failure or the pressure of learning a new academic subject. Because students revisit new concepts often, review and test them with different levels of complexity, they know that they have time to understand and practice any topic. An approach based on transfer qualities of the brain also allows the instructor to analyse the class's strengths and weaknesses regularly and adapt the rest of the program accordingly.

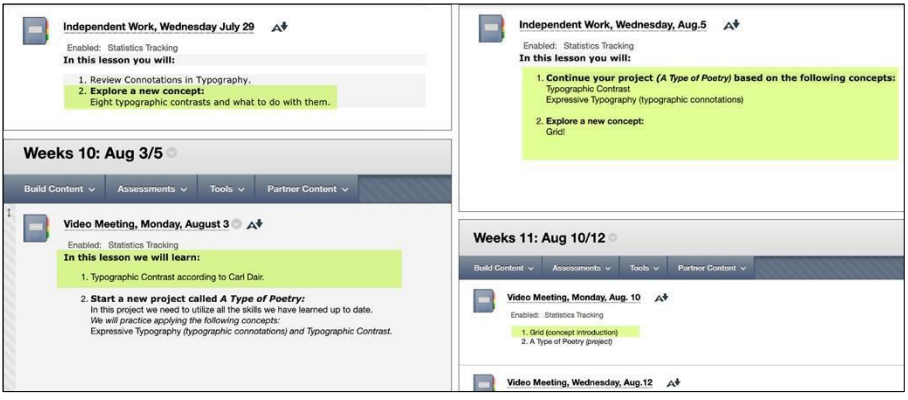


Figure 2. Typical spiral order of content presentation: ***A.*** *Independent work: concept exploration – Typographic Contrast.* ***B.*** *In class lesson: Typographic Contrast. C. Independent work (homework): assignment based on the topic of Typographic Concept, etc.*

5. 1. Examples:

An integrated assignment can be an overview of a design movement connected to a specific period in history (including but not limited to design history), with principles of visual composition originated or best represented during that time; or a visual analysis of a project by a current designer of choice from a provided list, related to a topic in a visual composition course. Other possibilities may include building connections made through learning technical skills specifically related to the history of typography (setting text for a specific reading process, or choosing a typeface most suited for small screens, etc.); or understanding typographic classification through hands-on activities that help explain the reasoning behind their design (block printing using compositions with modern serif vs slab-serif typefaces); or studying basic principles of trade, psychology of collective memory, and cultural meaning of images as a part of an introductory course on brand and identity design. A more specific example based on current affairs might be the following topic: How the protest posters from

the American Civil Rights Movement (1950 – 1960s) inspire the work of designers today, and what other examples of such relationships we can investigate.

5. 2. Reflection:

Instilling an ability to connect ideas and use those connections productively is the final purpose of content integration. Rather than studying a single concept in depth (the depth of understanding can be achieved later in educational process), we build the skills to cover a wide breadth of investigation and the ability to transfer the learned tactics to other projects.

6. Grading system to inspire student's success

If students struggle with attendance or class/homework, they often have a history of academic failure and rejection. These are usually the reasons why said students encounter problems and why they haven't mastered the executive skills to maintain a good record. This situation becomes a never-ending cycle where one issue leads to another. Failing such students in the classroom will not serve them well in the long run. They are accustomed to failure. It does not motivate them to do better next time. "Personal relevance, some control of the learning process, and a sense that one can master—and is mastering—the material." (C.Wieman, 2013, p. 1) affect students' learning success going forward. Therefore, instead of failing, the students are encouraged to make small efforts, implement minor changes in their approach to school, and if necessary, are provided with a personal learning plan that allows students to move forward, to clearly recognize their accomplishments, and finally, to finish the course successfully. This approach helps the students restore their sense of purpose and desire to succeed again.

6.1 Progress grade:

One of the most difficult habits to break for students with emerging visual literacy and limited ability to engage in the culture of design is the tendency to rush through the design process. It is not that the students do not want to explore the design challenges in depth, but rather that they have never independently done a thorough investigation of any kind before and cannot yet comprehend how to approach it. Therefore, when a student shows great effort and substantial progress in their process, they are assigned an extra grade for such achievement. This grade usually allows the student to raise their final grade and motivates them to continue developing their design process capability by widening and deepening their field of investigation. Progress grades can also be assigned to acknowledge formal or conceptual growth based on the exerted effort.

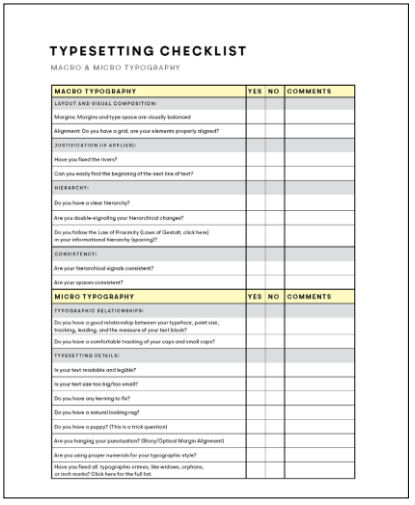
6.2 Reflection:

There are, of course, cases when no support or encouragement is enough to help a student to overcome their situation or circumstances, but even then, students learn to look for solutions rather than give up. *Persistence is not only an important personality trait, but also a catalyst for successful design methodology or an educational endeavour.*

7. Tools of the trade

Following is the list of educational tools, techniques, and activities that the author has found helpful and productive for both in-person and online classroom environments.

7.1 Checklists



Original checklist, compliments of Inna Alesina (Stevenson University School of Design). When the author began the process of adapting her program for graphic design fundamentals to meet the needs of junior college students, she received an example of a Project Checklist from a colleague and friend *(I. Alesina).* Since then, the author has realized that her students react better to checklists than rubrics, and a well compiled checklist can serve as a multifunctional tool in design learning and critique processes.

Checklists are very handy for students who have just began to practice abstract thinking, visual conceptualization, formal principles of graphic design, and rules of composition. Checklists help students to receive a clear and concrete critique, as well as provide the ability to refer to the components and requirements of a successful assignment at home in the simplest form *(Figures 3, 4).* They also assist in peer critiques by helping students self-reflect.

CHECKLIST FOR ALTER EGO CHARACTER CREATION:

	DRAFT 1			FINAL		
	YES	NO	COMMENTS	YES	NO	COMMENTS
Originality of the concept and literary style:						
Language consistency:						
Design consistency:						
Relevance to the project description and all the requirements *(file naming, titles, etc.)*:						
Clarity of communication:						
Relevance of the object selection for each archetypal quality:						
Is the object selection specific enough to create a focused image collection?						
Accessibility/availability of the objects to the designer *(how easy will it be to 'collect')*:						
Extra, NON-COMMUNICATIONAL elements:						
Copyright issues, attributions:						

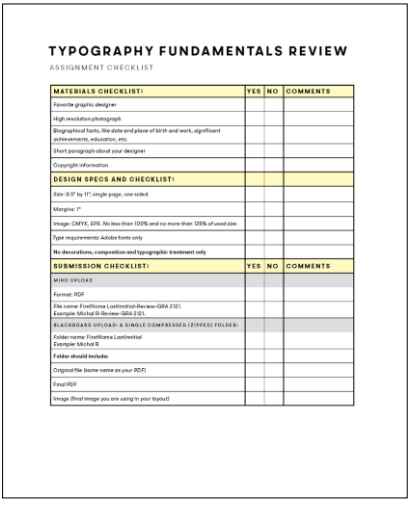


Figure 3. Alter Ego: character creation checklist.

TYPESETTING CHECKLIST

MACRO & MICRO TYPOGRAPHY

MACRO TYPOGRAPHY	YES	NO	COMMENTS
LAYOUT AND VISUAL COMPOSITION:			
Margins: Margins and type-space are visually balanced			
Alignment: Do you have a grid, are your elements properly aligned?			
JUSTIFICATION (IF APPLIED):			
Have you fixed the rivers?			
Can you easily find the beginning of the next line of text?			
HIERARCHY:			
Do you have a clear hierarchy?			
Are you double-signaling your hierarchical changes?			
Do you follow the Law of Proximity (Laws of Gestalt, click here) in your informational hierarchy (spacing)?			
CONSISTENCY:			
Are your hierarchical signals consistent?			
Are your spaces consistent?			
MICRO TYPOGRAPHY	**YES**	**NO**	**COMMENTS**
TYPOGRAPHIC RELATIONSHIPS:			
Do you have a good relationship between your typeface, point size, tracking, leading, and the measure of your text block?			
Do you have a comfortable tracking of your caps and small caps?			
TYPESETTING DETAILS:			
Is your text readable and legible?			
Is your text size too big/too small?			
Do you have any kerning to fix?			
Do you have a natural looking rag?			
Do you have a puppy? (This is a trick question)			
Are you hanging your punctuation? (Roxy/Optical Margin Alignment)			
Are you using proper numerals for your typographic style?			
Have you fixed all typographic crimes, like widows, orphans, or rich marks? Click here for the full list.			

TYPOGRAPHY FUNDAMENTALS REVIEW

ASSIGNMENT CHECKLIST

MATERIALS CHECKLIST:	YES	NO	COMMENTS
Favorite graphic designer			
High resolution photograph			
Biographical facts, like date and place of birth and work, significant achievements, education, etc.			
Short paragraph about your designer			
Copyright information			
DESIGN SPECS AND CHECKLIST:			
Size: 8.5" by 11", single page, one sided.			
Margins: 1"			
Image: CMYK, EPS. No less than 100% and no more than 135% of used size.			
Type requirements: Adobe fonts only			
No decorations, composition and typographic treatment only			
SUBMISSION CHECKLIST:	**YES**	**NO**	**COMMENTS**
MIRO UPLOAD			
Format: PDF			
File name: FirstName LastInitial-Review-GRA 2121. Example: Michal B-Review-GRA 2121.			
BLACKBOARD UPLOAD: A SINGLE COMPRESSED (ZIPPED) FOLDER:			
Folder name: FirstName LastInitial Example: Michal B			
Folder should include:			
Original file (same name as your PDF)			
Final PDF			
Image (final image you are using in your layout)			

Figure 4. Typography Fundamentals: typesetting and design analysis checklists.

7.2 Extra opportunities within the design classroom:

Learning the basics:
The competencies for design foundation courses do not include many hands-on skills. Usually those skills as well as other design related techniques are offered in separate courses, like photography or printmaking. Since some students often need to decide between coming to class and going to work, the author has included projects and workshops that involve elements from other creative disciplines. The only three considerations in the selection of which course flourishes to include are: the role of the technique in graphic design, the logistics of producing the work during the class period, and the price of the materials.

Collaboration for an inclusive classroom environment:

Collaboration is a crucial part of an inclusive classroom, in-person or online.

The following are examples of in-class collaboration for different projects *(Figures 5, 6).*

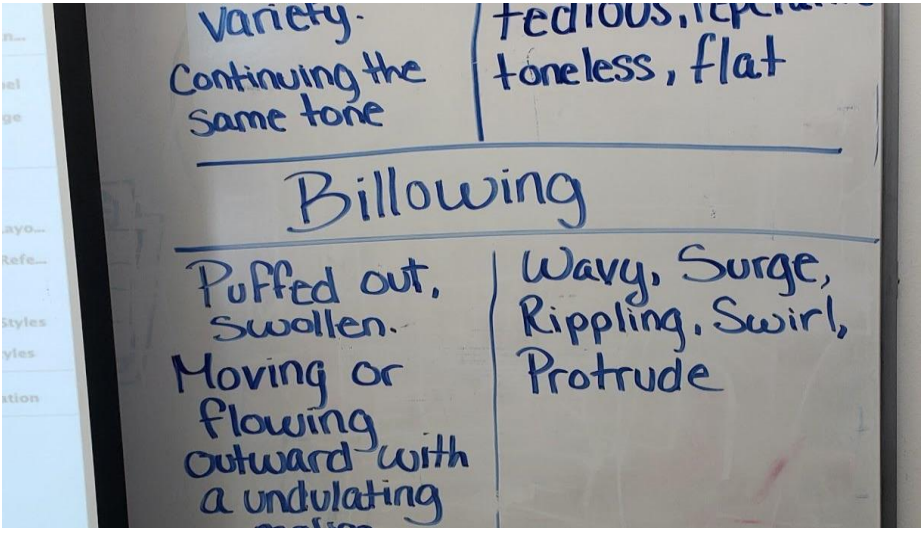

Figure 5. ***A.*** *Words & Meaning, research. Spring/Fall 2020. Group exercise. (**B**: Online whiteboard, Miro.com). Students investigate different meanings of a set of antonyms, to help choose the meaning that inspires the best visual interpretation of those concepts.*

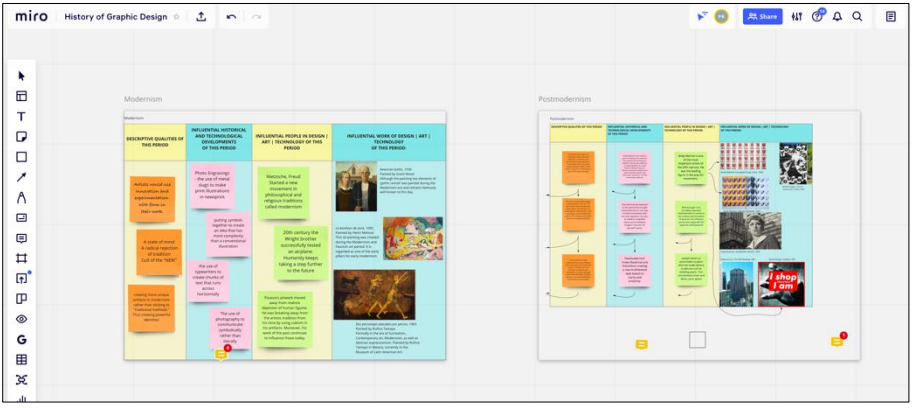

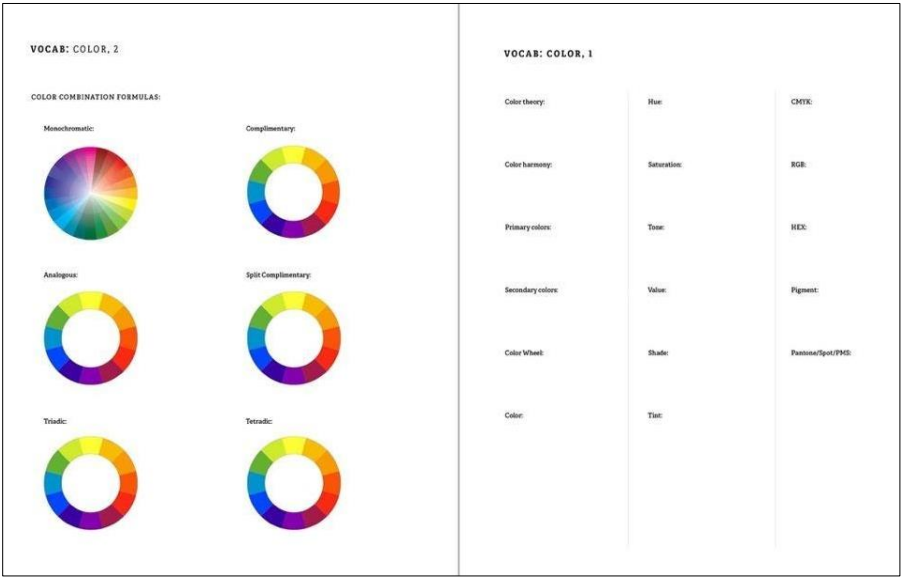

Figure 6. Traditional Design History. Fall 2020. Group research using online whiteboard tool, Miro.com. Students compile their own references on the different periods of design history.

Design vocabulary

In the beginning of a course, students are provided with a design vocabulary file. It is an ongoing interactive list with links to external references and resources. Students are encouraged to use it in discussions and verbal critiques. Among other benefits, it is a great help in learning new design terms.

Questionnaire-based readings and video lessons

To help students with different levels of reading comprehension, the author employs reading and video questionnaires. Each questionnaire is compiled to help with text/video analysis and develop a mindset for independent analysis *(Figure 7).* This approach helps students on different levels: students who need support with informational analysis use the questionnaires as a guide, as well as a checklist; students with an aptitude for informational analysis always use open ended questions to add different perspectives to class discussions. This helps all groups to learn from each other and supports the diversity of opinions in the classroom.

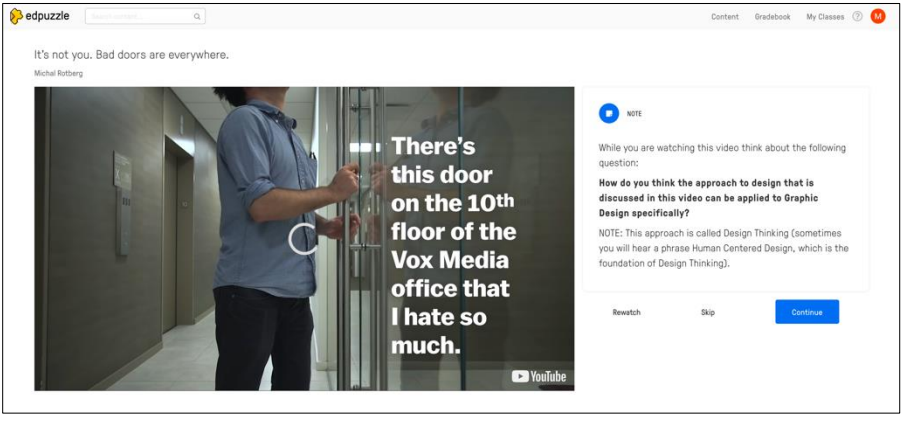

Figure 7. ***A.*** *Learning color. An example of a simple questionnaire.* ***B.*** *Introduction to Design Thinking, video lesson. The video used, by Posner, Mars, & Barton for Vox.com, 2016, includes an interview with Don Norman. A single question questionnaire, lesson created using Edpuzzle.com.*

8. Conclusions

In addition to a multidisciplinary knowledge base, graphic design education builds on formal and visual skills like cultural awareness and critical thinking. The author's initiative is meant to create a transparent graphic design classroom through empathetic learning practices, real-time program modifications, and other student-centered methods of instruction that help students to improve their visual literacy and reach other milestones in their professional growth.

Adapting methods of information delivery, critique, and evaluation to the needs of a specific group of students brings the freedom to introduce more complex topics and substantial studio assignments. Building on students' strengths helps them deepen their perception of design, evaluate their own talents, and realize their potential place within the industry.

Spiral progression in learning ensures students' ability to retain and connect complex topics. Content integration (e.g. cultural, ecological, historical, etc.) lays a contextual foundation for the students' conceptual and formal growth.

A systematic approach to analysis and evaluation tools, like reading/video questionnaires and checklists, teach clear and actionable steps to address design challenges.

All of these strategies are student-centered and aimed at creating an empathetic learning environment. Originally, the author developed them for junior college design students with different levels of preparedness, who undergo many external stressors that hinder and sometimes prevent their educational progress. Because the author's approach is focused on inclusive methodologies and flexible content, these strategies can be tuned to other areas of design education and educational communities to help students with similar needs.

Cultural Differences as Challenges and Design Drivers in the Development of Smart Assistive Technology for an Ageing Society

Danying Yang*[a], Louise Moody[a]

[a]Centre for Arts, Memory and Communities, Coventry University, Coventry, UK
*danying.yang@coventry.ac.uk, yangdanying2007@yahoo.co.uk

Abstract | Cultural differences are important in terms of working processes and practices, and in order to achieve innovation and market success. The MATUROLIFE project is seeking to explore, understand, and embed cultural differences when designing smart assistive products to improve the independence of older adults. As a case study, the project explores cultural differences between user groups and stakeholders in different European countries, as well as in the collaboration of partners from different disciplines and organizations. Co-creation and service design have been employed to mediate these differences. The case study outlines a design management process that has accommodated scientific innovation and complexity whilst acknowledging cultural diversity in end-users and between disciplines and partners. This paper demonstrates how design can be understood as a culturally situated practice where cross-cultural differences can provide challenges but are also opportunities to drive changes in practice, innovation and enable positioning in a European wide market.

KEYWORDS | CULTURAL DIFFERENCES, ORGANIZATIONAL CULTURES, SERVICE DESIGN, CO-CREATION, DESIGN MANAGEMENT

1. Introduction

Culture has extensive and various definitions. From a wide ethnographic viewpoint, Edward Tylor (1871) interpreted culture as an umbrella term embracing the social behavior and norms of human societies, also including knowledge, belief, art, law, customs, and any other capabilities and habits acquired by those within a society (Bennett, 2015; Tylor, 2010). Hofstede et al. (2010) defined culture as "the collective programming of the mind that distinguishes the members of one group or category of people from others". National culture refers to similar individuals, institutions and organizations across countries (Hofstede, 2011). Organizational culture is a mixture of organization practices and management structures arising from the interactions of people with their work environments and it may vary per country (Tomek, 2011; Weiner, 2005). Despite the classification of culture, many studies have indicated that cultural differences are significant and influential but the effect may not be conscious and well recognized (Lachner, Saucken, Mueller, & Lindemann, 2015; Stahl, Maznevski, Voigt, & Jonsen, 2010).

Hofstede (2001) argued culture and cultural values play an influential role over almost all aspects of human life, and the realm of design is not an exception. The impact of cross-cultural differences has been discussed in research areas such as sociology and psychology with a growing interest in design (Halskov & Christensen, 2018). When an organization successfully integrates design, a design culture can emerge. This may be rooted in design thinking and be characterized by design activities as well as through the interaction of actors as well as local norms, values and assumptions (Elsbach & Stigliani, 2018; Manzini, 2016).

Comparative research on cross-cultural differences in design is often considered from a theoretical perspective rather than in terms of practical application (Lachner et al., 2015). This paper explores the impact of both working and living cultures on design. Cross-cultural differences are considered within the context of the EU funded MATUROLIFE (Metallisation of Textiles to make Urban living for Older people more Independent and Fashionable) project. The project is making use of innovations in smart materials, and techniques developed to metallise fabrics to develop new assistive technology products for older adults across Europe. In this case study, cultural differences have been considered in two dimensions:

1. The work or organizational cultures of the project partners
2. The country-based cultural differences between our product end-users

The product development process adopted within the project considers cultural sensitivities and differences amongst the potential users of the MATUROLIFE products. Whilst the project management approach adopted considers cultural differences between partners and their working approaches. The project consortium is comprised of 20 partners from 9 European countries and includes a range of subject expertise including electronics, printing, electrochemistry, material science, design, clothing, footwear and furniture manufacturing.

The project team is developing assistive technology prototypes to help older people age independently at home through the use of smart materials and big data. In order to equip everyone in the project with the necessary design tools to prioritize human needs and interactions, co-creation and service design have been employed through an iterative process. The approach seeks to align and connect end-users, different organizational partners and a variety of disciplines and stakeholders.

2. Literature Review

The working environment has become multicultural, cross-generational, and multidisciplinary in order to address new and emerging challenges in a globalized world (Tomek, 2011). As posited in Erez & Earley's theory (1993), culture is a shared meaning system. Individuals working in the same team have a common cultural ground, whilst team members working in a multicultural work environment may need to develop a shared meaning system beyond their different national cultures (Erez & Gati, 2004). New forms of organizational cultures have emerged through projects from international to multinational and transnational levels, requiring high levels of interdependence and team-working (Ochieng & Price, 2010; Shokef & Erez, 2006; Tomek, 2011).

Increasingly research explores multicultural team work from a globalized cross-cultural perspective, for example the experiences of project managers from a case study of UK and Kenya (Ochieng & Price, 2010); or multicultural groups involving participants from American and East Asian cultures (Aritz & Walker, 2014). However, Gobel et al. (2018) argue there has been little research on cultural diversity in terms of meanings, values, and identities in the European context. European culture is not simply "western culture", the majority of EU citizens conceive their continent as distinct and unique in its diversity whilst sharing elements of collective culture (CAE, 2018; Eurobarometer, 2007). In fact, existing cultures in the European context are broader and defined by different historical, political and economic circumstances, with many national cultures co-existing under the European umbrella (Gobel, Benet-Martinez, Mesquita, & Uskul, 2018).

Cross-disciplinary, collaborative research and innovation is a prominent theme in the 21st century. There has been a shift in research from an individual endeavor to a team effort due in part to the multidisciplinary skills required to create novelty and innovation. Multidisciplinary collaborations are seen to develop new knowledge and address complex problems through diverse expertise (Klein & Falk-Krzesinski, 2017), alongside interdisciplinary and transdisciplinary collaborations (DeHart, 2017). These forms of collaboration add new dimensions and considerations in the understanding of a work culture, and bring new challenges and opportunities to project delivery in a European context. Through funding schemes such as Horizon 2020, researcher collaboration across disciplines and with other stakeholders is encouraged to heighten innovation, as well as bridge the academic and industry sectors for improved impact, sustainability and

competiveness (DeHart, 2017; Klein & Falk-Krzesinski, 2017; Stokols, Hall, & Vogel, 2013). Whilst varied intellectual and disciplinary cultures can spark innovative responses, the research and practice process can be challenging (O'Rourke, Crowley, Eigenbrode, & Wulfhorst, 2013). The combination of different perspectives and the complexity of implementation can highlight issues of communication across disciplinary boundaries, and linguistic and cultural differences (DeHart, 2017; O'Rourke et al., 2013).

It has been argued that the application of design increasingly represents the uniformity of mass globalization rather than cultural difference and diversity (Carlson, 2011). In addition to the multicultural and multidisciplinary work environment in which design may be undertaken, cultural differences and diversity are also important to inform design. De Souza and Dejean (1999) argued that end-users are not just physical and biological beings, but socio-cultural beings, hence cultural diversity appears in all human action, including in the products designed and developed by humans. Szántó (2001) further argued that “innovation starts with people, not with enabling technologies, and the designers’ main role is to mediate between technology and culture and to add ethics and aesthetics to technology”. Knowing whom you are designing for and the reasons why users would or would not want, need and use the end product are critical for effective innovation and market success. Designers typically consider a range of human factors issues when designing for, and with people, including their physical needs, social behavior, emotional requirements, etc. A key factor often ignored is culture variation (Bettio & Plantenga, 2004; Kokkoris & Ku¨hnen, 2013). The consideration of cultural factors could facilitate product innovation and help achieve product acceptance and user satisfaction (Moalosi, Popovic, & Hickling-Hudson, 2006).

When considering ways to embed cultural awareness into design, one might consider service design as a means to reflect an awareness of the importance and impact of innovating customer / end-user experience (Stickdorn, Hormess, Lawrence, & Schneider, 2018). Service design is rooted in design thinking, and utilizes knowledge from other disciplines focusing on services. It brings a creative, human-centered process to service improvement or designing new services and offers a holistic, multidisciplinary and integrative approach (Miller, 2015; Moritz, 2010; Segelström, 2010). In the MATUROLIFE project, service design has been considered as tool to not just enable product innovation but to enable partners who are not traditionally involved in design to be involved in, and improve the design and development processes within the project.

In many service design projects, user-centered and participatory design approaches have been used to investigate user needs. Co-design integrates different perspectives to understand both the requirements and demands from users and customers, and how technologies and processes can be employed by partners and collaborators. A wide range of benefits is attributed by co-design, such as improving customer relationships, reducing costs, increasing wellbeing and helping to organize innovation processes more effectively (Steen, Manschot, & Koning, 2011). Co-design and co-production between designers, technologists

and end users are increasingly used for new product design and service development as well as high technology research and development in a range of domains (Freire & Sangiorgi, 2010; Rahmani, Roels, & Karmarkar, 2017; Steen et al., 2011). Here it is applied in the integration of advanced materials into products to support older adults, whilst service design has helped consider the wider service to sit around those products and to enable our multidisciplinary team development approach.

3. MATUROLIFE as a cultural case study

The MATUROLIFE project aims to develop and integrate smart materials to enable discrete and effective collection of health and well-being data to guide user behavior and support independent living by older adults. The design process whilst accommodating scientific innovation and complexity acknowledges cultural diversity across Europe as well as factors associated with ageing and later life. The project brings together a multicultural and multidisciplinary team of 20 partners from 9 countries (Belgium, France, Germany, Italy, Poland, Spain, Slovenia, Turkey, and United Kingdom). The team has 9 different first languages and represents a range of different types of organizations (including Small and Medium Enterprises, Research and Technical Developers, Manufactures, Non-Government Organizations and Higher Education Institutions).

Following desk-based design research to understand user needs, semi-structured interviews were undertaken with 37 older adults from six countries (ensuring representation of Northern, Southern, Eastern and Western Europe). During these interviews cultural differences between older adults were explored from different perspectives such as economic status, social cognition, approaches to the care of older adults, digital literacy, design preferences, fashion trends and technology adoption.

To build on this initial understanding, co-creation and service design were employed as the main design methodologies. Through the co-creation process, team members from different organizations and disciplines came together with end-users to conceptualize design ideas for desirable assistive technology products for older adults. Concepts were centered on assistive clothing, footwear, and furniture, as products that could utilize smart materials and areas in which the consortium held manufacturing capability.

Service design activities were undertaken within workshops attended by partners (designers alongside other disciplinary specialists, e.g. material science, engineering, human factors) to develop working processes, resolve technical decisions and balance conflicting requirements.

3.1 Co-creation workshops

The co-creation workshops built on insights and functional requirements collected during 37 interviews. In order to cover all project partner countries, ten workshops were scheduled with one in each partner country and two in the UK (as illustrated in Figure 1).

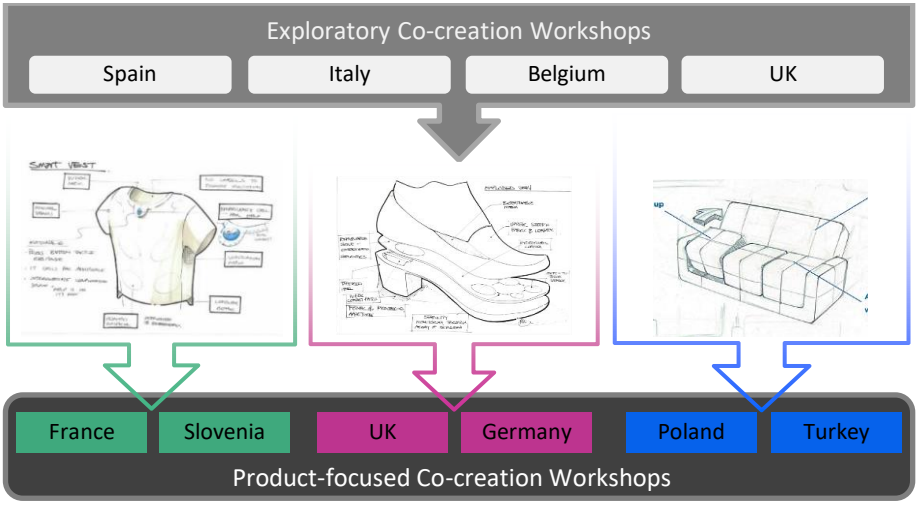

Figure 1. Two sets of co-creation workshops scheduled with each partner country

The first four workshops was used to explore participant perceptions of independence and scope initial requirements for smart assistive technology products that would address real needs identified by the users themselves. The team was interested to understand if there were differing needs or priorities in different countries. This led to a first version design brief for a product, furniture and clothing based product that focused on shared needs, but also identified country-based differences. The second set of six workshops, focused on prioritizing product requirements (for each of clothing, footwear and furniture) and co-creating design ideas in response. Prior to these workshops the design brief was translated by the designers into a series of initial ideas which were used in the workshops to prompt and encourage participants to develop ideas together with the designers. The process from semi-structured interviews to co-creation workshops is summarized in Figure 2.

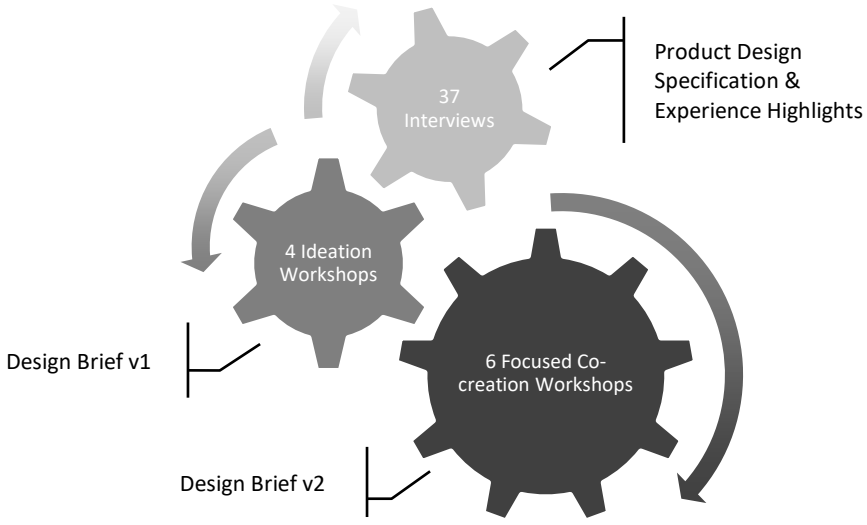

Figure 2. Design process from semi-structured interviews to co-creation workshops

With both MATUROLIFE team members and participants coming from different national and subject backgrounds, the workshops were refined and adapted to the local needs. For example, images of existing products country-sold were used to prompt discussions. These were selected by local partners to represent local tastes and trends. The workshops were run and captured in the language of the participants and translated after the session.

It was understood during the co-creation process that people contribute at different levels depending on their level of expertise, creativity and personality. Therefore, the workshops aimed to encourage discussion and participant ideas. Initial ideas were presented by product designers in sketch form communicating their status as works in progress and therefore encouraging comment and involvement from participants.

The workshops employed various design tools (a workshop setting is shown in Figure 3 and explained further in Callari et al. 2019) (Callari, Moody, Magee, & Yang, 2019) to provide a framework to encourage collaborative exploration and dialogue between workshops participants. These tools aimed to be readily translatable for use in different countries and enable comparison of outcomes between countries.

Figure 3. Participants co-creating ideas with footwear manufacturer

After design ideas were generated for product lines in footwear, clothing and furniture, the project partners refined the designs to embody the color, style and material preference specified by the older adults, whilst planning how to develop and embed the required assistive functionality in an effective, safe and usable way.

3.1.1 Reflections

The design research and semi-structured interviews highlighted regional variations in cultures and traditions, and key differences in how older adults are cared for in different countries. There is limited design research exploring trends and attitudes in terms of design and technology for different regional older adults, yet their needs in terms of maintaining independence and potential spending power should be acknowledged.

The four exploratory workshops demonstrated that although the participants have different national cultures, they reached a consensus on the understanding and definition of an independent living that involves good health, mental capability, physical wellbeing, autonomy and social connection. A number of common challenges were also identified by the participants in terms of age-related factors, environmental factors, societal factors and economic factors that may affect their well-being and independence. As a result of aligned views, health-related priorities could be formulated and taken to the second set of workshops to be validated by participants from different countries.

Concept ideas were then further developed through the six product-focused workshops. In order to reduce stigma and likely abandonment rates, these solutions focused upon

improving independence (including safety, health and/or security), at the same time being inclusive, light, comfortable, attractive and desirable – priorities for all.

There was found to be no significant differences in the contribution made by participants from different countries or based on age or gender. Similar needs were identified, however the co-creation workshops highlighted some cultural differences between countries in terms of style preferences and tastes, and in terms of acceptance of technology with some examples below.

- Clothing workshops: France and Slovenia

Participants in France and Slovenia showed quite different responses to the examplar images presented. In France, participant ideas included adding removable layers to enable something to be worn in different seasons or adding a higher collar to cover the neck in winter. They preferred designs that were adaptable and 'stretchy', not tight or restrictive. Participants emphasized the needs for clothes to remain elegant. *"When you are elegant you stay young"*. [FR, Workshop #5] In Slovenia, participants wanted the garments to be shaped to the silhouette, and dresses and skirts to fall over the knee. In contrast, a looser shape was preferred in Paris.

- Furniture workshops: Poland and Turkey

Differences in interior furnishing emerged. In Turkey, participants preferred to consider the design of a multi-functioning sofa with a flexible head cushion, integrated storage, and encouraging the user to get up and be active. They explored embedding functions to detect air quality, contact family members when needed, and give visual feedback on household dangers. In Poland, participants were more concerned more about the furniture providing ergonomic support and the size of it "*lightweight and easy to move around*" [PL, Workshop #4] rather than additional functionality. The nature of soft furnishing and desire for removability of covers etc. appeared to vary in different countries.

- Footwear workshops: United Kingdom and Germany

Despite the common requirements for footwear, there was contrast in how receptive participants were to technology. In the UK, there was a lot of discussion about technology and how it could be used to address the requirements by embedding functionality in the shoe. In Germany, there was less emphasis on using technology to solve these issues whilst participants focused more on the physical structure design of the shoe and the selection of materials as a way of addressing aches and pains in terms of feeling steady on one's feet. German participants indicated more distrust in relation to how their data might be used.

The process of co-creation was in some senses used here as a means to reach consensus rather than design for difference. However, through the process, differences in preferences, attitudes as well living conditions in different countries (e.g. temperature) were found to affect how a design might be developed and packaged for the user.

Following the co-creation workshops, three multidisciplinary sub-teams (Figure 4) were formed to enable the ongoing product development focusing on assistive footwear, clothing and furniture. Smart materials, sensor and electronic technologies, associated data processing and user feedback were collaboratively incorporated in co-designed product concepts with continuing users and stakeholder involvement. The ongoing development was supported by a service design approach.

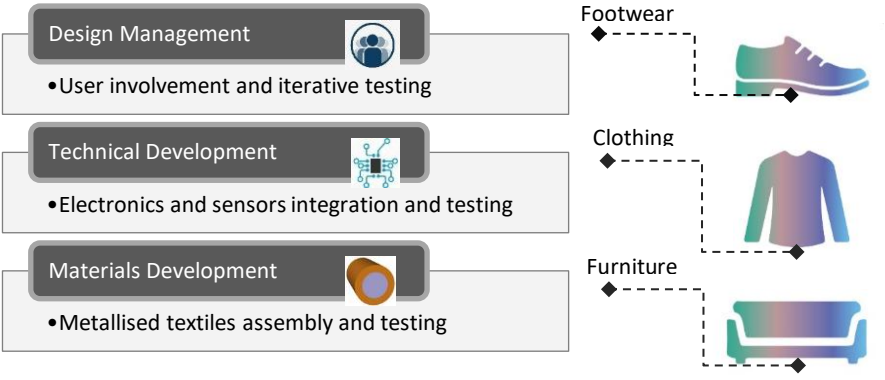

Figure 4. Three multidisciplinary sub-teams for three product design and development

3.2 Service design workshops

Service design was used as an approach to align the varying cultural perspectives of partners through design tools that would prioritize user needs and build these into a shared set of interactions which the project team could work to. It is argued that with the growing complexity of products and product services (Norman, 2011), innovation and competitive advantage is best achieved through a shared understanding across a diversity of stakeholder knowledge (Self, 2019). This was achieved through both the co-creation process and through the use of service design.

The MATUROLIFE consortium is large (40 +people) and varied in partner backgrounds and working practices (20 organizations). Each of the partner groupings (e.g. origination type, size, subject discipline, language) have different ways of working and communicating and bring different perspectives to the development of the technology. A collaborative working approach was embedded through a series of design and development workshops supported by regular virtual meetings (i.e. Convene and Zoom calls). An online shared working platform was created to share work in progress (MATUROLIFE SharePoint) and to create a working culture and synchronized knowledge.

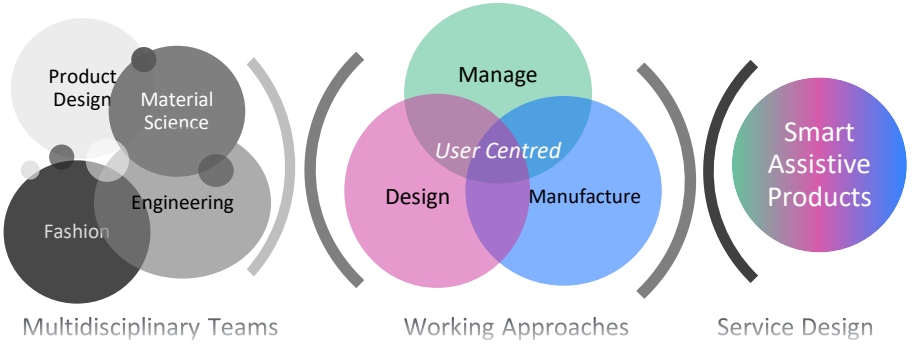

Figure 5. Service design crossing exemplar discipline boundaries

Service design was employed as a tool iteratively through the project lifetime during consortium meetings and development workshops. Service design approaches have typically focused on one system level at a time (Patrı´cio, Fisk, Cunha, & Constantine, 2011). The way it was utilized here was focused on two levels:

1. Designing for the user experience
2. Integrating differing working cultures between partners (as illustrated in Figure 5).

3.2.1 Reflections

The service design approach led to a series of maps or blueprints of the assistive product functionality and accompanying service. These were supported by detailed user journeys that interpret the interactions between the end users and proposed products. These provided the basis for future development. They have been reviewed at each consortium meeting to remind partners of the shared vision, to be updated according to necessary design changes, and to provide the framework for future planning (for example the data management structure for the emerging products).

The project team has reflected regularly on their working approach and the role of design management and service design within that. Some of the biggest challenges in the project were perceived by partners to be *"scale"* [TR, Partner #a] and *"communication, because these are subject areas that are not normally put together"* [UK, Partner #c]. It was felt that this type of large-scale and multidisciplinary high-tech project could constrain the imagination of designers and challenge non-designers. Feedback from partners after workshops suggests that the design approach has been effective in bringing people together to create a shared vision and direction.

> "With a project as ambitious and complex as this to deliver, methods to bring together and align the consortium and our research and development goals are essential. We see effective design management as a way to optimize our vision and ensure the user remains at the center of our development approach and ongoing delivery strategy." [UK, Partner #b]

Some of the key working differences that have been addressed through this approach are:

Partner languages: English is not the first language of most partners. Both English and a partner's local language are used during day to day project work. Reporting and email communication are undertaken in English. The discursive, diagrammatic and visual ways of working have enabled minimal use of text and supported partner communication.

Subject-specific language and terminology: Subject-specific language (knowing what we meant by specific terms e.g. scientific processes, design approaches) has proved another communication challenge. This is further compounded by country differences in meaning. For example early in the project, there was a significant debate about the definition of assistive technology. A co-creation approach was adopted to reach an agreed definition. The use of visual maps and icons has enabled a shared understanding.

Decision making and working approach: Partners demonstrated different ways of thinking, planning and decision making. For scientists this may be heavily evidence-based. Other disciplines are able to rely on more intuitive approaches and less structured. The service design approach created alignment and identification of elements of the project that had to be evidence and user-driven, and others that enabled creative expression.

User-focus: Whilst the focus on the end-user and customer is central to organizations working in design, it is not necessarily a central consideration in chemistry or electronics. The MATUROLIFE project is centered on the needs of older adults and the service blueprints that have emerged hold the partnership to the needs and journey of users when making decisions.

Organizational/ company priorities: Organization types vary in their capacity to be nimble and adapt, and in terms of the support infrastructure and bureaucracy. There is also variability in the capacity and inclination to innovate away from existing processes. The service design approach placed limits on the product scope that were necessary to manage resources and deadlines.

4. Conclusion

In this paper cultural differences from several different perspectives have been considered within the context of the MATUROLIFE project. Although the impact of these factors in

design has been studied in previous research, how they interact with each other in has received less consideration. Co-creation and service design approaches were employed in the project to reconcile these differences, in order to build understanding and empathy for older adults across the partner countries in terms of their acceptance and expectation of assistive technology products and services, also to establish a collaborative working relationship between different disciplines and various groupings within the project consortium.

The findings reveal that cultural differences were presented at multiple levels, encompassing end-user perception, design activities, work environment and product values. The co-creation workshops highlighted differences between the tastes of participants from different cultural backgrounds, and the varieties due to geographical and socio-economic factors. Exploring these differences more extensively is not the core focus of the study but does have critical implications for design. Project collaboration and communication has been supported by a service design approach and this has helped overcomes some of the challenges to working across countries, disciplines and organizational cultures.

Design is not only about crafting products and systems, but an approach to open innovation that enables complex and interactive experiences, processes and systems (Freire & Sangiorgi, 2010; Moritz, 2010). Design in this context is complex; culture can be a resource for design innovation and inspiration. It is hard to design with a range of cultural factors intertwined, but it is argued that through the MATUROLIFE project these challenges can drive innovation by using design management as a strategic tool.

Data visualisation and knowledge sharing in participatory design to improve people liveability in urban places.

Giovanni Borga*[a], Massimiliano Condotta[a], Chiara Scanagatta[a]

[a]Università Iuav di Venezia
*borga@iuav.it

Abstract | People living in urban areas are expected to highly increase in future. Society in urban context becomes more complex, and newer social, cultural and economic challenges occurs while decision-making processes become more difficult due to the increase of actors involved and plenty of information flowing by ICT networks and media. In such crowded environment, people can be very close to each other and, at the same time, might not know about urban issues due to different backgrounds or lack of knowledge. Looper demonstrates how an ICT and Urban Living Lab integrated approach can be enforced by environmental design methodologies that start from user needs and improve knowledge proximity and physical proximity. The Verona study case, described in the paper, shows how a collaborative usage of ICT allows a better comprehension of different points of view, enhancing a fertile co-design process avoiding the creation of "cultural bubbles" that hinder cultural proximity.

KEYWORDS | CO-DESIGN, KNOWLEDGE SHARING, DATA VISUALISATION, INTERACTION DESIGN, USER CENTERED DESIGN

1. New challenges in the design of urban spaces

Since the ratio of people living in urban areas is expected to increase from 55% in 2018 to 68% by 2050 (United Nations, 2018), it is becoming always more important to understand how to design - and transform - urban spaces to realise the most liveable urban environments for this increasingly population.

Due to this growth forecast, nowadays the design of urban spaces is characterised by different tasks that need to be faced. Following the SDGs from the United Nations it is possible to see how a main challenge - SDG 11 - is that of creating more sustainable and liveable cities, by also reducing their adverse environmental impact. This has to be done both with regard to the impact that a city has on global terms, and both with regard to the community level. SDG 11 target 11.3 says: "By 2030, enhance inclusive and sustainable urbanization and capacity for participatory, integrated and sustainable human settlement planning and management in all countries" and its indicator says: "Proportion of cities with a direct participation structure of civil society in urban planning and management that operate regularly and democratically".

To reach this goal then it is necessary to apply participatory approaches - that have been used since the '70s but are only now becoming more widely diffused - that can help to trigger changes in the built environment. To have a successful participatory approach then there is the need of a wider involvement - or the creation, depending on the existing socio-cultural environment - of the bottom level, since changes with participatory methods are triggered with bottom-up approaches - as further shown by the Looper project described in this paper.

Our idea is to check how these challenges can be faced by using culture of proximity to approach environmental design to create more liveable urban places.

2. Culture of proximity for liveable urban places

To manage and deal with the abovementioned new design requests, there is the need to evolve an organic methodology based on the bottom level approach. The features needed to create this new environment are:

- urban phenomena knowledge, not only on a larger urban scale but mostly at a small local scale that allows a better knowledge of the neighbourhood. This knowledge of urban phenomena needs to be not only theoretical but more direct, practical and material;
- exchange and transfer of knowledge, to be combined with knowledge storage not to disperse what was done previously;
- avoidance of "cultural bubbles" to create a fertile ground for the exchange of knowledge between parties.

In our vision the cultural environment that is created by these features is a possible interpretation of culture of proximity. This concept of proximity can then be understood in two different ways, and both ways are complementary to define culture of proximity. Proximity can be:

- "proximity of space"
- "proximity of people"

Proximity of space is related to the knowledge of the local area in which someone lives. This proximity aspect is about the nearness of someone to the investigated area. Residents of the investigated area are then the main actors when *proximity of space* is triggered.

Proximity of people is about the ability to exchange knowledge between users of the same space - the closeness allows the reciprocal learning between people living and using same places. This proximity allows people to feel closer one another as they are working towards a common goal and they have a mutual understanding.

When both a *proximity of space* and a *proximity of people* is found, then it is possible to activate a functional - and functioning - culture of proximity.

An example of triggered culture of proximity are Urban Living Labs (ULLs) were residents, that have a more direct understanding of a certain urban place, can share their knowledge - by allowing a *space proximity*. In the same way, since different stakeholders are involved in ULLs, a wider knowledge sharing can take place within ULLs. This then allows a *proximity of people* since individuals with different backgrounds, and that use the project area for different needs, can gain deeper knowledge on the place and can share a different point of view from the resident's one.

Urban Living Labs are not the only expression of culture of proximity, they are more of an example of organised triggered culture of proximity. The contemporaneous existence of proximity of space and proximity of people can take place also in a more organic way, when people are willing to make a place more liveable even for a short period of time, or to allow others to take back their places - e.g. festivals, events. This need to retrieve public places to create a better urban reality based on physical and cultural proximity was partially expressed by Michael Sorkin (1992) that talked about proximity to encourage cultural creativity triggered by these fluid connections.

This paper will then focus on how to activate culture of proximity for designers that are willing to create more liveable urban places through participatory design.

3. Strategies to activate a culture of proximity

How is then possible to activate this culture of proximity inside a design process? To benefit of the culture of proximity what can be used are Urban Living Labs - as aforesaid - and

different tools for data storage, data visualisation and knowledge sharing. These two approaches are suggested to be used simultaneously to reach better results.

Like said before, Urban Living Labs are a fertile ground for both proximity of space and proximity of people. This can happen because ULLs are able to create a neutral terrain for people living close-by, where they are able to share their knowledge with other actors of the urban environment change, but they can also allow the exchange of knowledge between other stakeholders that might not be residents.

The involvement of cultural proximity in urban design then gives better results when the new shared knowledge basis - given by the presence of both residents and other actors - allows the mitigation of social, cultural, technical and economical differences. Once these differences are mitigated then the cultural proximity can be used to work towards a shared goal.

To create the necessary background for the growth of culture of proximity, also different ICT tools can be used. Indeed, to share knowledge - when it comes to urban environment changes - there is the need to have both visualisation tools, that can allow an immediate sharing of information, and storage tools, that can allow a longer-term sharing. ICT tools usage starts from a carefully designed data collection phase - that gives better results if it is centred on a participatory approach, that then allows the visualisation of the acquired knowledge - based on a combination of qualitative and quantitative data. The information gained with both the data collection and data visualisation, are then used to co-design and co-evaluate possible solutions to make urban places more liveable.

4. Culture of proximity's activation strategies as applied in the Verona case study within the Looper project

This concept of culture of proximity has been applied and tested in a European research project. The Looper project is co-founded under the JPI Urban Europe program and it focuses on three pilot cases: Manchester, Brussels and Verona. In this section, to better describe our concepts, the Verona case study is used and in particular the area of Verona Sud is considered in the framework of the project.

The area of Verona Sud (Figure 1) is mainly influenced by air quality and noise pollution issues, and there are multiple neighbourhood associations which have a conflictual relationship with public partnership and policymakers. This contrast is due to misunderstandings which are raising from lack of shared knowledge by both parties.

Hereinafter a real-life application of the culture of proximity concept to Urban Living Labs and to different tools is described.

Figure 1. Verona location with reference to the Venice and Milan, and a zoom-in of the Verona Sud area that is divided from the city centre by the Verona former freight yard

4.1 Urban Living Lab

Within the Verona ULL the actors where linked by both a proximity of space - i.e. residents - and by a proximity of people - i.e. between residents and public administration, NGOs, commutes and other final users. Verona ULL's actors were: citizens and citizens' associations as bottom level stakeholders; Verona City Council as public administration and local governance stakeholder; Legambiente - an NGO actively working on environmental issues - with the role of stakeholder and of support to organisers; Università Iuav di Venezia in the role of researchers and organisers.

Having all these different actors working together was challenging in the beginning, because there were many different points of view at the same table, but once all stakeholders understood the benefits they could gain, the meetings started to be more constructive. The knowledge sharing given by culture of proximity was the one thing that triggered the willingness of actors to actively participate at meetings, because they understood they could be empowered by what was happening during the meetings.

Different activities were done during each ULL meeting, and to support culture of proximity within these activities different tools were used. Activities faced topics of data collection, data visualisation and analysis and design of possible solutions to improve the urban environment liveability. The tools that supported the ULL activities allowed a levelling of knowledge between different actors.

4.2 Data driven design of support tools

The tools used within Looper ULL differed based on the activity they supported. They can be divided into three main groups: data collection tools, data visualisation dashboard and co-design tools.

Data collection hardware tools were low-cost and official body sensors to collect quantitative data about pollutants, and these quantitative data were integrated with a web

app to collect qualitative data about the perception of urban spaces. This app has been very helpful to better understand the knowledge of residents, allowing to link objective data to the knowledge shared by people. This stage was essential to the process because it was possible to support with quantitative data the space proximity knowledge. Indeed, at the same time it was possible to link space proximity and proximity of people because some misunderstandings about pollutants were repressed.

Moving on with the process, the visualisation dashboard was an interactive web map were all data previously collected were freely accessible to allow an exchange of knowledge between all actors of the process, and not only a sharing of knowledge between people with a proximity of space. This tool showed not only data collected with official body sensors, but also data collected with participatory sensing. This data visualisation was the first real moment of confrontation were proximity of space and proximity of people gathered together to benefit of the culture of proximity concept.

Then, for co-design, both online and offline tools were used. For what it concerns a culture of proximity point of view, the online part is of more interest. The used online co-design tool was developed by a third party, and it allowed to link the proposed solutions with a particular location within the project area. This online tool allowed both a share and a storage of knowledge. The knowledge sharing was intrinsically possible due to the online characteristic of the tool, this meant that anyone could propose their idea even if they could not attend the offline meetings. The tool also worked as storage of knowledge, because it was possible to upload the solutions proposed during ULL meetings. This possibility to store, and not only share, is a focal point for culture of proximity because it allows to reach new participants.

5. Data driven tools for co-design

5.1 Looper data driven tools design strategy

For the design of the Looper platform, a multidisciplinary team was formed involving architects, digital technologies experts and design experts (all partners of the Looper project). Particularly, technical developers worked alongside with visual/data interaction designers who also held specific technical skills that helped in avoiding one of the typical problems in this kind of scenario that is the delegitimization of the role of designers in the development of ICT tools. This issue is clearly investigated by Gasson (1999); during the implementation of IT tools, which are “purely technical” tools, the technical developer does not take designer's contribution into consideration, neither in terms of defining the data model nor of interaction design.

Gasson (1999) argues that, in many cases, the User Centred Design (UCD) approach can be adopted in a more formal than substantial way; in the case of Looper, UCD was applied from

the very beginning in the conceptual modelling phase of the platform by using a special survey aimed at knowing what data and knowledge were needed for the three ULLs.

Following the first step of user research, a UI mock-up was designed and developed (Figure 2). The first prototype was then presented to participants of ULLs to get feedback about it, and it was then implemented following the suggestions collected from this second round of user experience observation. This participatory UCD was done following the typical Living Lab approach of design, test and implementation inside the real environment.

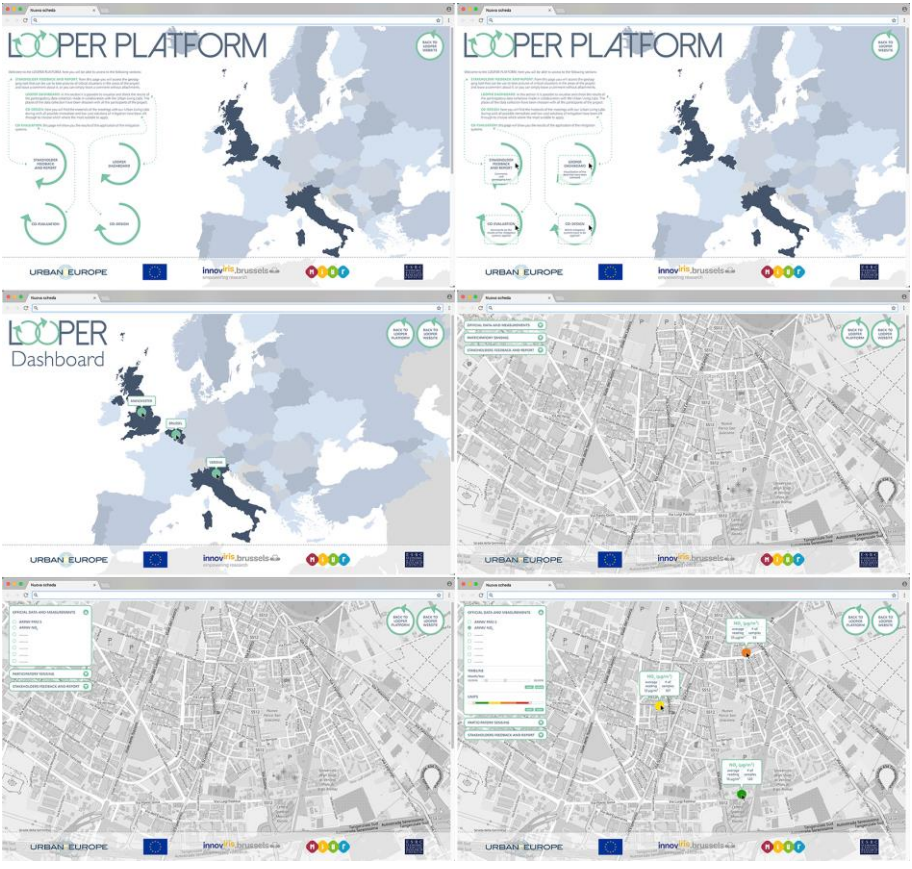

Figure 2. Looper platform mock-up. Here the initial design of the UI is shown

The issues that can arise in trying to obtain an optimal proximity of people within ULLs are manifold; some of them are related to the use of technological tools and digital interfaces by very different users with very uneven digital skills while others are more related to the

specific content, sometimes very technical, that the ULL must deal with. These issues can be summarized as follows:

- Language differences in actors with more technical profile and non-technical ones, belonging to different contexts or ordinary citizens;
- Usability and understanding of rich-content information and possible excessive cognitive load;
- Differences between datasets collected by different ULLs, and the complexity of defining a data model that allows to manage them in an integrated way;
- Previous mistrust between involved actors.

Differences in cultural backgrounds are strictly related to the proximity of people aspect. In Looper, actor's cultural inhomogeneity in some ULLs was an underlying design condition and it has imposed the development of a multilingual platform as well as a special data structure capable to manage contents in four different languages. However, in most cases, verbal language is not the only key point; indeed, also for the graphic language and maps visualization a special approach is needed to improve proximity of people. In map visualization symbols are frequently used, while styles' meaning is explained with a legend; when users have very different cultural backgrounds, this can be an issue and a limitation of graphic effectiveness. Therefore, minimizing the use of symbols whose meaning is not immediate is mostly recommended.

The problem of the too high cognitive load generated by graphic visualizations is known and well described by Mazza (2017) who argues that to achieve "good communication goals in HCI we aim to lower cognitive load on an interactor because this better support information memorization". Using map visualization, the too high cognitive load can be a more severe issue since there is often a tendency to overlap several information layers to obtain a more comprehensive synoptic view about different aspects or to highlight their mutual correlation.

The three study cases give us a scenario with a wide variability of themes data to be collected for monitoring tasks. The indeterminacy and variability of the data to be managed by the Looper platform forced to design a "flexible" data model that would allow to access different types of georeferenced data in different ways. The risks highlighted by Gasson (1999) relating to the technical approach in the development of Information Systems, have been mitigated by the strategic choice to subordinate the technical development to the content design and the definition of multi-actor data collection methods creating an effective "peer cooperation" between IT team and design team by involving a designer with specific technical skills. As Curtis et al. (1988) said while arguing about the "expert designer", the cohesion of the team can be greatly improved if the designer holds special IT skills because this allow him to proficiently and effectively interact with the technical developer.

The last identified main issue concerns frequent situations of distrust or contrast between actors that hinder fruitful cooperation. As well described by Mayr et al. (2019), issues about

“trust” in data usage is mainly related to provider credibility and its good relationship with the final user. However, also transparency is a key factor, and it is related to the possibility to access original data from which a processed information is obtained. This means that the willingness of actors to positively accept some provided data is related both to the acceptance of the source and to the way data were processed.

5.2 A user-centered data model

Bertin (1977) has clearly shown that information has a multi-layered structure. Basically, the main layers are two: entities and relationships - concept also known in database theory. This means that to design new IT tools, information designers must work very closely with technical developers. Cases such as Looper demonstrate a key point: the database structure modelling phase belongs to the content design, rather than the container design; this means that it is a task that designers must carry out, rather than the technical developers, as happens in most cases.

As already mentioned, the User Centered Design approach in developing the data model in Looper specifically aims at improving proximity of people. The first method used for this purpose was called “Problem Framing” and focused at designing the data structure needed to store and process the data coming from the multitemporal monitoring campaigns carried out by ULLs. As shown in Figure 3, the Problem Framing is fuelled by the results of a preliminary phase aimed at finding the issues on which the ULL wants to work.

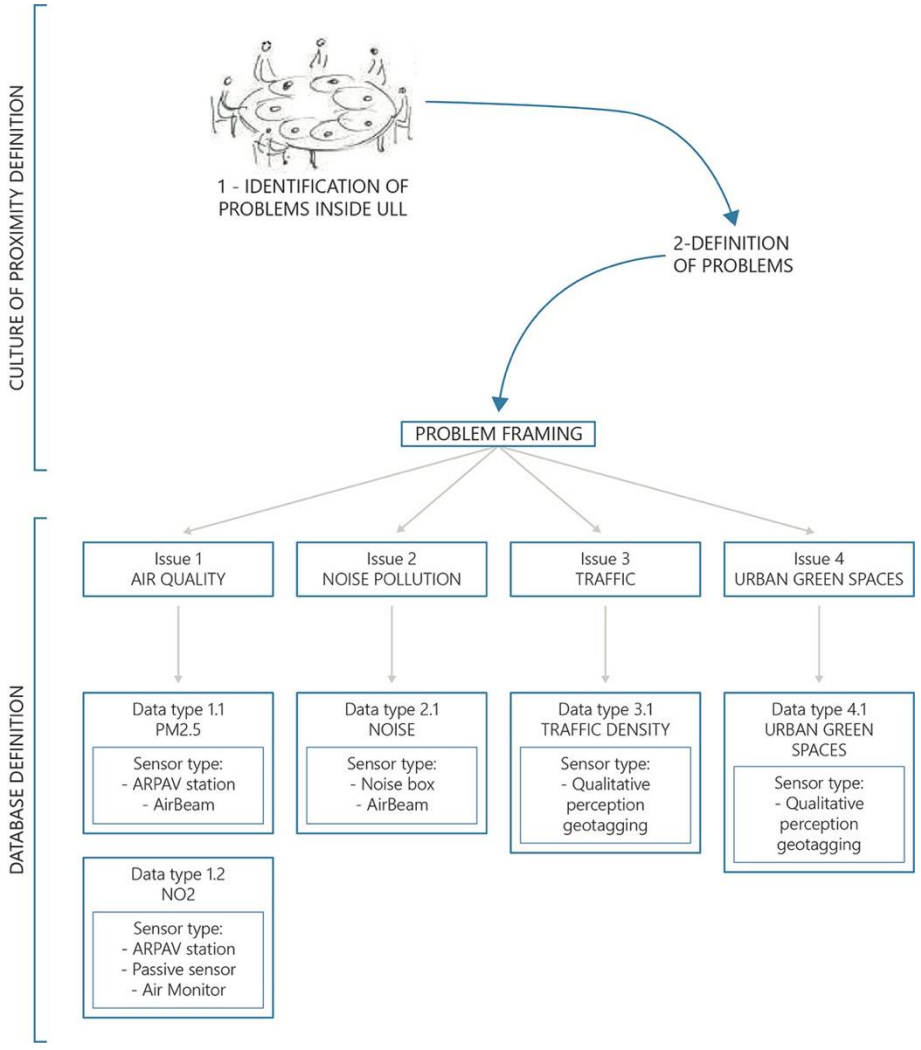

Figure 3. Data model of the Verona case study. Here data to be uploaded in the database are defined to allow a common framework for the three study cases.

A two-layer - issues/data-type - data structure came from the results of a special survey aimed at finding needs of each ULL. The semantic relationship between the two layers is the capability of each data-type to support decision process about one or more issues. More in depth, the data model structure is further divided into other entities: from data-type to raw-data, sensor-type, campaigns, sensors and, as regards geolocation, measuring-spots (for point geolocation) and grids (for distributed geolocation).

5.3 Data visualisation tools

Designing the Looper platform, as result of the problem framing, some choices have been made regarding the data model definition, however, other choices made are more related to visualization and interaction concerning map layers structure, data processing, interactive tools and maps symbology.

In terms of map layers structure, the choices were basically two: the separation of all data into simple layers by type of measured phenomenon (only one type of information for each map layer) and the layers grouping by source. The separation of different sources helps to perceive the difference in data accuracy implicitly related to the collecting methods, and it allows to simplify the symbology as much as possible so to reduce the cognitive effort endured by the user (cf. Ware, 2004).

The choice not to process and integrate datasets, providing simple and direct - uninterpreted - layers is intentionally aimed at increasing credibility of the source and trust in the end user-provider relationship (cf. Mayr et al., 2019). It also eases to apply quantitative symbols according to Rensink's "carriers'" definition: "visual property that conveys quantitative information" (Rensink, 2018), which maximizes the effectiveness of visual communication of measured phenomena.

As regards to interaction, according to Kirsh (2004), the goal is to "reduce the complexity of choice" in the perception of how to explore data and better understand map content. Furthermore, to reduce the usability gap between more and less digital skilled users, map based interaction has been limited to the two basic actions: "click to get info" and "drag to pan", leaving out other typical functions such as "drag to select", "drag to zoom-in" etc.

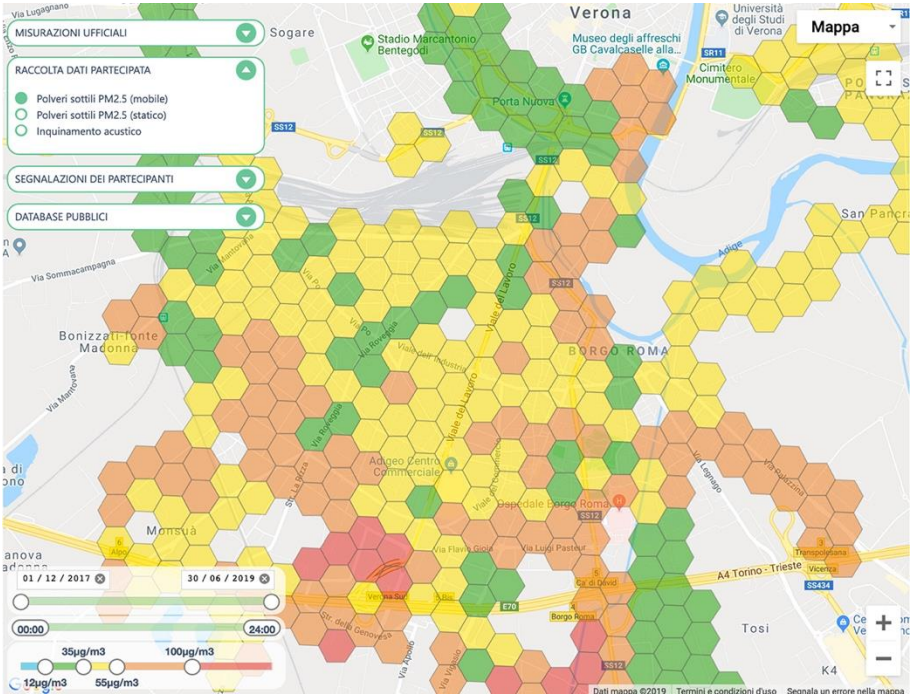

Figure 4. Example of visualisation of data collected with a participatory sensing tool that works with a continuous in movement method. Each hexagonal cell shows one value that is the average of all data collected within the area defined by the cell, and in the timeframe defined by the scrollers on bottom left.

In some cases it was necessary to make some data pre-processing because of visual and technical ineffectiveness of displaying raw datasets; this is the case of all distributed monitoring campaigns resulting in millions of point data that had to be interpolated upon a fishnet layer (Figure 4) and styled using the colour carrier (Rensink, 2018). In this particular case, a special tool has been developed in order to enable users to customize styles in real time - mitigating the perception of viewing already interpreted data.

5.4 Co-design tools

Like the display section of the Looper web platform, the co-design section is also designed as an asynchronous multi-actor remote repository, that is a dynamic and implementable storage system of useful digital resources that can support ULLs decision processes.

Even if hosted on the same platform, the two sections have been deliberately kept independent; no data available in the co-design section is dynamically linked to any other stored in the monitoring section, precisely to enhance interpretation of live data during ULL

activities carried out in a participated way leading to the development of solutions through direct interaction of the actors.

Technically, the online co-design tool, developed by Urbanista, was developed using a WordPress plug-in (Figure 5). This tool was chosen due to the possibility of adapting styles according to the main website, its easy integration and user-friendly mode with few steps needed to insert a new idea.

Figure 5. Example of the online co-design page that firstly shows a map with the proposed ideas localised in the project area, and by scrolling down shows a grid with the ideas and their description.

The proposed solution or ideas can be easily uploaded by filling few fields of the format as per the following Figure 6. Out of the seven fields only four are mandatory - 1. Category, 2. Title, 3. Description and 4. Name or nickname - while the others are optional. The category field is a drop-down menu from which to choose a category, this allows to later evaluate the proposed solutions easily as they can be grouped. The title and description fields instead are free fields and have no minimum or maximum number of characters.

The structure of this online co-design tool also allows a storage of the solutions proposed during the offline meetings, as it is possible to mark them by using a nickname that refers to the meeting date.

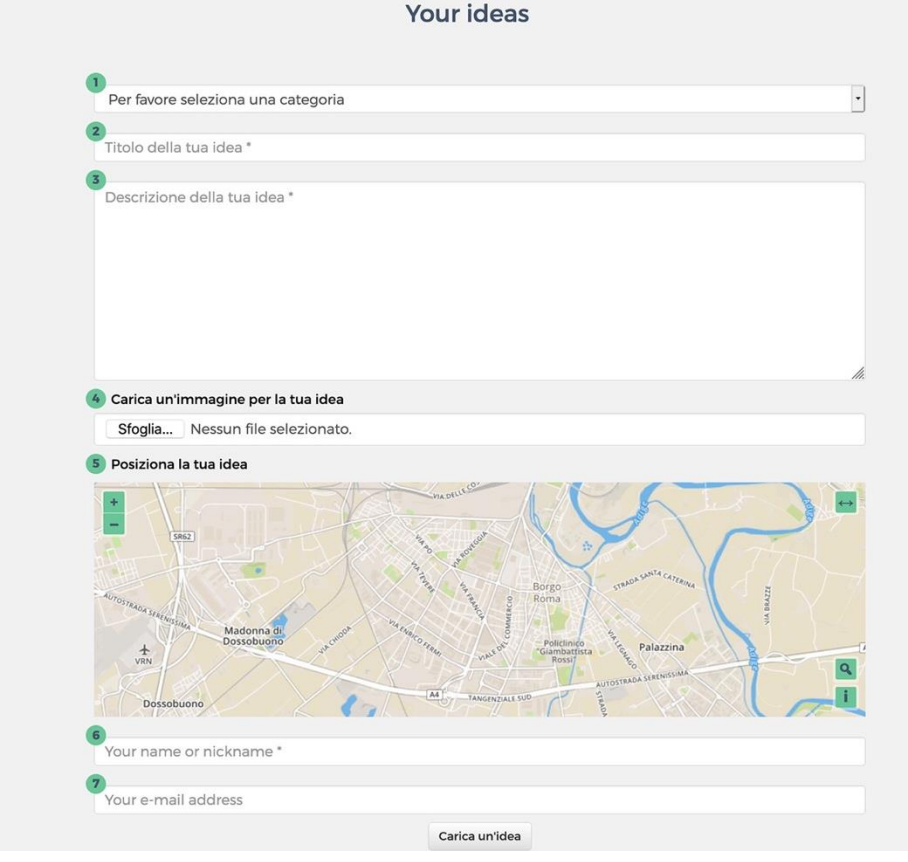

Figure 6. Ideas upload format. From the map, users can add the location for the proposed solution.

6. Conclusion

Within this framework, ICT and interactive tools need to be designed and inspired not to support activity of collaboration between people further away - and to create a global network, but need to be designed to support a culture of proximity that is focused towards the improvement of people's liveability in urban places.

Within the Looper project it was possible to have an evaluation of the platform from a co-creation process point of view (Figure 7), since the aim of the platform itself was that of enhancing participation even for users who could not come to offline meetings.

ICT tools are then of mixed use due to the proximity concept, meaning that they are feasible both in their online version and in their collective usage during offline meetings.

HAS BEEN THE PLATFORM USED BY ORGANISERS?	
Comments	*Organisers mostly used the platform as it helped to organise and keep a focus during the workshops done with stakeholders. The platform was also used within internal meetings to always have control of what was happening during the project* *This happened both during the first and second loop*
N° of data layers	*13 (first loop)* *15 (second loop)*
HAS BEEN THE DASHBOARD USED BY USERS?	
Comments (by organisers)	*Users used the dashboard both during the first and the second loop*
N° of accesses	*1607 (2018)* *714 (2019)* *23 (2020)*
Its usage during living labs sessions?	*The dashboard was mostly used during living lab session of the first loop*
USABILITY	
Comments by (organisers)	*Users asked the implementation of the scrollers (timeline) for a more detailed visualisation of the AirBeam data in different periods, they also found interesting the acoustic zoning layer once added*
User feedbacks	*They found the dashboard feasible and user-friendly for their needs*
DOES THE DASHBOARD TRIGGERED LEARNING PROCESSES?	
information ('know-what')	*Participants learned the importance of the participatory data collection as they could see how many data they could collect all together* *This happened both during the first and second loop*
networks ('know-who')	*No. The dashboard did not allow direct interaction in-between different stakeholders since it is a visualisation tool.* *This happened both during the first and second loop*
skills / resources ('know-how')	*Participants learned how to read collected data in a clearer way* *This happened both during the first and second loop*
norms / goals ('know-why')	*Based on the shown results, participants better understood why official sensor are not positioned too close to each other.* *This happened both during the first and second loop*

Abstract | This paper focuses on the democratization of the design culture through the design knowledge transfer (DKT) analysing the empirical activities of an academic design research laboratory as a case study. The analysed laboratory is born as a research and development project, mainly funded by the local government for introducing the human-centred design culture through service design at a local scale. As a result, a strategy for introducing service design in the local systems is identified. The strategy can be also considered a scale of complexity for transferring the design knowledge and a possible way for democratizing design to the local entities that do not systematically use design. Despite this aspect needs more investigation, the strategy is actually adopted by the laboratory as their free offering system to be experimented with the local entities by envisioning and following the conceptual framework of 'Research through Transfer through Design'.

KEYWORDS | DEMOCRACY; DESIGN KNOWLEDGE TRANSFER; SERVICE DESIGN; COMPLEXITY; PUBLIC POLICIES

1. Design and democracy: a premise

The interest of the design community in the convergence between design and democracy is giving the opportunity to defend democracy as a value through the design culture (see Manzini & Margolin, 2017, 2018). Using design as a tool for democratization in the way of design of, for, in, as democracy (Manzini & Margolin, 2018) also means spreading the design culture in all the complex contexts the contemporary society is involved.

The authors of this paper argue the transfer of design research activities helps to work on the convergence between design and democracy. From this, transferring design knowledge facilitates the spreading of the design culture; consequently, it facilitates the use of design as a tool for democratization.

1.1 Democratizing design

The concept of democratizing design can be addressed according to different perspectives such as:

- democratizing knowledge; in terms of knowledge transfer, its generation process through participative experiences and its meanings under democratic principles (for a further understanding of this perspective see Elden, 1983; Gaventa & Cornwall 2008; Ginwright, 2008; Guzman et al., 2016; Zamenopoulos & Alexiou, 2018);
- democratizing innovation that moves from the market-oriented concept of product (or service) innovation addressed by von Hippel (2005) to a different approach related to long-term, situated and "on the go" participatory approach (for a further understanding of this perspective see Björgvinsson, Ehn, & Hillgren, 2010) that improves collaborations between bottom-up initiatives and against an elitist control of innovation;
- democratizing design; in terms of the democratization of the design discourse through the design practice; in other words, the process of democratizing the design knowledge.

The concept of democratizing design, in this paper, differs from the way of understanding the democratization of design as the democratization of technologies that facilitate the processes of designing and producing artefacts; not even with the meaning of social product development (Forbes & Schaefer, 2017). Neither it is treated as a topic for investigating the states and future of the designers and/or the design education (see Fleischmann, 2015; Kelly, 2019). For democratizing design, the authors mean the act of rendering democratic (Democratization, n.d.) the design knowledge. Democratization as a systematic open-ended series of processes (Ciprut, 2009) for spreading the knowledge related to design research and opening the design culture through the democratization of the design discourses and practices.

1.2 Why democratizing design

Knowledge can be considered a resource of the power (see Gaventa & Cornwall 2008); and, sometimes it is a monopoly of expert knowledge producers (see Fals-Borda & Rahman, 1991; Hall, 1992 in Gaventa & Cornwall 2008). In this way, design knowledge can be considered a resource for breaking the monopoly in designing in a culture and preserving the democracy of designing. This concept drives the authors in considering the democratization of the design knowledge as a way for breaking this monopoly and spreading the design power for preserving the convergence between design and democracy. These are the reasons why this paper focuses on the democratization of the design culture through the design knowledge transfer (DKT), analysing the empirical activities of an academic design research laboratory (lab) as a case study.

2. Methodological approach

How is it possible to democratize design at a local scale to support the relationship between design and democracy and introduce the design culture in complex contexts?

According to this question an academic design research lab was considered as a case study for hypothesizing relevant discussions for the answer. Therefore, the actions of the analysed lab were considered the phenomena to be studied within its real world context (Yin, 2018) with the aim of understanding if it is a case of democratization of design at a local scale. The DKT process of the lab, its potentialities and limits, and future developments were analysed with an inductive approach. The early years of the lab activities were critically analysed with the support of empirical data emerged during the activities organized in collaboration with the local stakeholders, design partners and entities.

Therefore, the establishment of the lab, the evolution of its research process and the activities provided with the local agents were considered as a set of empirical data. With the aim of providing a critical analysis based on data triangulation (Denzin & Lincoln, 2018; Yin, 2018) the empirical data were compared with different resources in design literature through references related to (i) design ladders (Design Council, 2013; Kretzschmar, 2003; Nusem, Wrigley & Matthews, 2017; Ramlau, 2004; Wrigley & Straker, 2017); (ii) cases of governmental innovation labs (Puttick, Baeck, & Colligan, 2014; Selloni & Staszowski, 2013); (iii) models of orders of design (Buchanan, 2001), design domains (Jones & Van Patter, 2009; Jones, 2014) and levels of design content (Young, Blair, & Cooper, 2001; Young, 2008).

3. The case

The analysed academic lab was born as an experimental project of research and development, mainly funded by the local government to introduce the human-centred

design culture through service design in the education, production and public policies systems at a local scale. The laboratory is hosted by a humanities department at the local university and its mission is to transfer design knowledge encouraging the usage of service design among entities that do not systematically adopt design. The goal is to support the transition of the local agents from a product-based economy to a service and knowledge-based economy.

From a global perspective, this project can be framed in a wide and contemporary discussion related to the growth of fields such as design for public and design for policy (Bason, 2016; Kimbell, 2015; Buchanan, Amatullo & Staszowski, 2019) where design thinking (often service design) can play a determinant role in the innovation process of complex public and governmental contexts (Buchanan, Junginger & Terrey, 2017; Junginger, 2013; Kimbell & Bailey 2017; McGann, Blomkamp, & Lewis, 2018; Rebolledo, 2016). Despite the relationship between design and the public sector is growing (Buchanan et al., 2019), it is still difficult to identify systematic ways to embed the design culture from a public perspective on small scale contexts (such as rural and urban Alpines areas) where design is still not systematically used. However, fostering service design thinking throughout the organizations is in line with the recognised relevance of service design given by the European Commission as a "key driver of service innovation, social innovation and user-centred innovation" (Dervojeda et al., 2014). Therefore, the analysed lab adopts service design as a strategic stimulant to encourage innovation in public and private organizations. Also, this follows the Action Plan for Design-Driven Innovation of the European Commission (2013).

3.1 The context of the lab project

The regional context of the analysed lab is under an autonomous province jurisdiction, in the northern side of Italy. The province is characterized by low population density, due to the mountain territory (Alps), its remote valleys and the high number of small-dimensions villages. In this province, there is no presence of specific entities advocating to spread the design knowledge and improve the local design culture. There are only specific courses in some degree programmes and two different small academy branches, which have not the DKT as the main purpose.

3.2 Design research and design knowledge applied at a local scale

Among the definitions of design research (Archer, 1981; Findeli, 2010; Jonas, 2014), the analysed lab deliberately refers to Manzini's (2009, 2015) working definition on design research i.e. "an activity that aims to produce knowledge useful to those who design"; this kind of knowledge is 'design knowledge'. As suggested by Cross (1999, 2006), design knowledge resides in people; processes and products. They are "three sources of design knowledge as research loci" (Cross, 2006). Therefore, the analysed lab refers to Cross's design research taxonomy (design epistemology, design praxiology, design phenomenology) to identify what to transfer to the local entities. Respectively the transferring process

focuses on (i) the designerly ways of knowing (Cross, 1982, 2001, 2006) and the design attitude (Boland, Collopy, Lyytinen, & Yoo, 2008); (ii) practices of design; (iii) form and configuration of the artefacts (services and systems in the case of the analysed lab). And service design is assumed as a strategic resource to be transferred.

3.3 A knowledge transfer point of view

The knowledge transfer activity of the lab is partially framed in studies related on how to embed design capabilities (often related to service design) in different kind of contexts and organizations (cf. Bailey, 2012; Giordano, 2019; Junginger, 2015; Lima & Sangiorgi 2018; Malmberg & Wetter-Edman, 2016; Mortati, Villari, & Maffei 2014; Warwick, & Djaelani 2016). However, "capability is an integration of knowledge, skills, personal qualities and understanding used appropriately and effectively [...]" (Stephenson, 1998; also in Mortati et al., 2014) and "transmission of design knowledge throughout organizations is expected to support non-professional designers to increase their design competences" (Lima & Sangiorgi 2018). Therefore, it is possible to frame the lab activity from the perspective of the knowledge transfer as a way to support the spreading of human-centred design capabilities paying attention to understanding how other entities design, what is their own design knowledge and their design legacies (Junginger, 2015).

3.4 The knowledge transfer process

It is possible to understand the DKT process of the analysed lab through the Nonaka and Takeuchi (1995) model of knowledge conversation. Indeed, observing design knowledge in two forms i.e. 'tacit' and 'explicit' (Polanyi, 2009; Liyanage, Elhag, Ballal, & Li 2009), the lab found a proper balance between its tacit and explicit knowledge transfer according to the key components "i.e. the source or sender that shares the knowledge, and the receiver who acquires the knowledge" (Liyanage et al., 2009). Canonically, the sender is the lab body of resources (e.g. the lab researchers and their tools) and the receivers are the local actors that collaborate with the lab through the provided design actions. However, it is also possible to observe an alternation of roles between senders and receivers that is when the lab body of resources convert the design knowledge acquired from people, processes and 'products' through activities exploited with the local actors.

3.5 The lab research approach and the action model

The research approach of the analysed lab can be framed in the design research studies adopting the research through design (RtD) (Frayling, 1993; Findeli et al., 2008; Jonas, 2007; Manzini, 2015) approach as a form of action research (Archer, 1995; Reason, & Bradbury, 2008; Stewart, 2014; Swann, 2002).

According to these premises, the lab designed a proper set of actions for transferring design knowledge to local entities in three phases i.e. (i) setting-up; to improve the interest in

service design; (ii) experimenting; to improve the autonomy in service design; (iii) modelling; to embed service design.

Each action can be applied according to an action model (figure 1) that the lab designed with the aim of engaging local agents, understanding and analysing their needs, designing and applying specific actions, evaluating the experiences. The phases of the model are:

- Engaging, to build design partnerships with local stakeholders;
- Analysing, to optimize design praxis and theoretical activities;
- Applying, to implement a series of theoretical seminars, workshops and design experiences (DXs);
- Evaluating, to analyse and reflect about the data gathered through in-field activities.

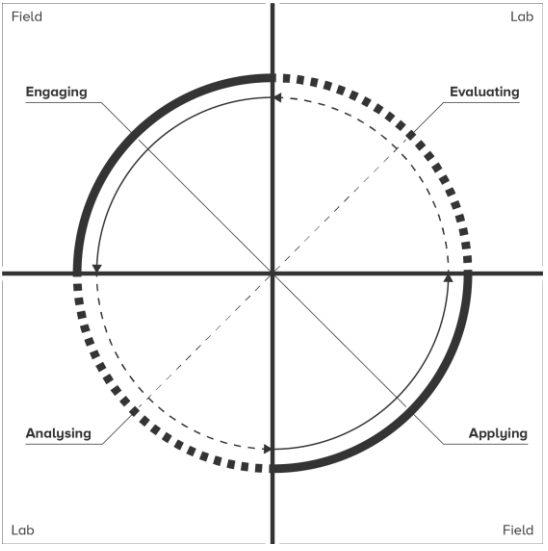

Figure.1. The action model adopted by the analysed lab.

3.6 The lab project development

The case presented in this paper refers to the early years of activity ('setting-up' step) of the analysed Lab. What follows summarizes the main activities provided through the action model.

In the 'engaging' phase the lab promoted service design at a local level with the aims to (i) engage potential stakeholders; (ii) collect interest for consecutive design partnerships from public and private entities; (iii) understand opportunities and needs of potential stakeholders; (iv) acquire human resources (such as design researchers).

In the 'analysing' phase, the lab started an intense programme of analysis with the aim of building shared theoretical foundations, research approaches and a practice framework for the design activities. Events such as seminars and theoretical workshops were designed with the aim of spreading a local design discourse among the local actors.

In the 'applying' phase, the lab team implemented the activities designed in the previous phases in contexts where design is not systematically applied according to the following main set of actions (figure 2). All the activities were provided to involve (for free) as many local actors as possible.

Theoretical Experiences (TXs). With the aim of supporting local design discourses and professions, thirteen TXs were organized among (i) seminars in collaboration with national and international speakers about different topics such as innovation, design research, service design, philosophy of design, interdisciplinary research; and (ii) intensive workshops with professionals and researchers in design about data visualization, design thinking, service design.

Design Experiences (DXs). Six DXs were organized with five local design partners from the public and private sector among the three systems (education, production, public policies). They were engaged in collaborative design practices (e.g. co-design workshops, design ethnography) simulating human-centred design processes (in service design) applied to real problems, needs and contexts through a learning-by-doing approach.

Stand-alone (one-off) project. A stand-alone project was developed in collaboration with the local government and their stakeholders in the field of public policies. The lab provided design-based visual tools to help a forum of experts engaged to identify strategies for the innovation of the local research and development policies.

Pilot study. The stand-alone project is a case study of an undergoing pilot study addressed to explore (i) how the local policy makers design public policies; (ii) how service design can contribute in this context; (iii) how the findings can be applied for the renewal of the local public policy sector.

Design probes. Following the directions previously identified in a forum of experts organized by the local government, experimental design probes were designed and applied to explore the design context of the local cultural sector in favour of a future redesign of the public cultural policies.

	ACTIVITY	Sector	Area	System	Format
THEORETICAL EXPERIENCES	TX1	Public/ Private	Open learning	Education	Seminar
	TX2	Public/ Private	Urban environment	Education	Seminar
	TX3	Public	Public innovation	Public policies	Seminar

Figure 2. A resume of the activities provided in collaboration with the local actors.

In the 'evaluating' phase, the lab team evaluated all the activities provided in collaboration with the local actors through mainly qualitative techniques. The participants' feedback, comments and suggestions were gathered through unstructured and semi-structured interviews, questionnaires, and focus groups. Also, data gathered and design results were analysed in the lab and data related to the DXs were deeper investigated with the Logical Framework approach and a gap analysis. The results were discussed comparing them with

the design research literature and the needs emerged through the experiences with the local actors.

3.7 Early results and impact

The main result of the early years of activity is the identification of strategic details that facilitate the DKT process. There were identified:

- a dissemination framework with different areas of interventions (i.e. discourses, publications and design formats);
- five design formats for the DXs (i.e. Design Check; Design Seminar; Design Workshop; Design Review; Design Studio);
- a format (theoretical framework, approaches, processes, toolkit and guidelines) for the application of the design probes for the DKT;
- fifty-three gaps, eight critical areas and five criteria for developing DXs with the design formats;
- ten requirements to develop DXs with inclusive criteria.

More than 200 people among the education, production and public policy systems were involved in collaborative design-based activities and more than fifty activities among the three areas of the Dissemination Framework were provided. Around 180 hours of collaborative activities were provided as part of the knowledge transfer process. As a main impact, the participants increased the interest in service design and requested 320% more collaborative hours in respect to the total amount of hours exploited during the firsts months of the lab activities.

4. Results and findings

The main results of the analysis of the lab as a case are (i) the identification of an overview of the main features that allow to recognize the laboratory as a strategic place for the local development; (ii) the identification of a strategy for introducing service design in the three local systems.

4.1 The lab overview

The analysed lab focuses on delivering activities with and for stakeholders in contexts where design is not part of the organizations and communities culture. Therefore, it operates with an inclusive approach in contexts where there is no use of design (see Kretzschmar, 2003; Nusem et al., 2017; Ramlau, 2004); or the use of design is recognized for a specific need in a one-time project (see Nusem et al., 2017) for solving discrete problems (see Design Council, 2013) and in general where design is perceived as ‘styling’ (cf. Kretzschmar, 2003; Ramlau, 2004). Moreover, the lab could potentially play a strategic role at local scale as a part of

innovation teams (see Puttick et al., 2014) in public innovation spaces for research, communication, networking and capacity building (cf. Selloni & Staszowski, 2013). Finally, the lab refers to (see figure 3); (i) the third order of design focusing on experiences, activities and services; (see Buchanan, 2001); the design for value creation, focusing on services (see Jones, 2014); the design of systems and services (the D2 level in Young, 2008).

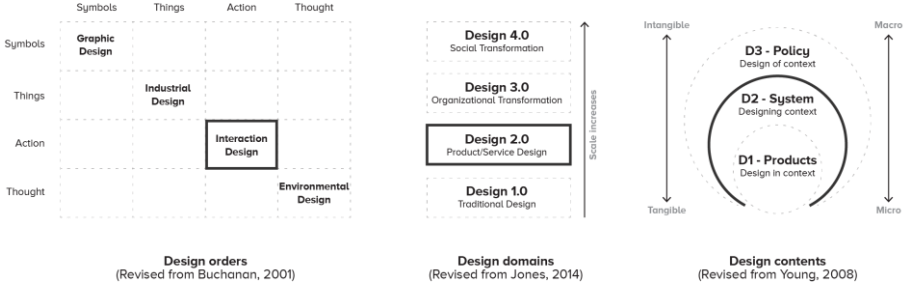

Figure 3. The analysed lab in relation to three different references.

4.2 The strategy for DKT

The analysis of the lab as a case study allowed the identification of a strategy for implementing a DKT process. The strategy is built in three macro-categories i.e. (i) discrete design tasks; (ii) training formats; (iii) projects. All the three macro-areas follow the goal of the laboratory with different specific objectives and complexity for each activity. All the three categories (except for one activity - see Figure 4) are supported by empirical cases previously provided by the same laboratory.

Indeed, the categories of the strategy are the result in observing the activities provided with the local agents and their feedback in terms of design needs related to what they experienced and what they were called to provide.

MACRO-CAT.	DISCRETE DESIGN TASKS		TRAINING FORMATS		PROJECTS	
Activity	Design probes	Stand-alone design-driven tasks	Theoretical experiences	Design experiences	Pilot projects	Research and development projects
Experienced	✓	✓	✓	✓	✓	
Seeked						✓
Cases	1	1	13	6	1	None

Figure 4. An overview of the strategy background.

4.3 Discrete design tasks

The first category is based on activities that allow the laboratory to activate processes for probing and exploring the design contexts through in-field design-driven experiences. It contains:

- (a) design probes to understand specific design contexts with design-based methods for probing and exploring;
- (b) stand-alone design-driven tasks to solve discrete problems with a specific design discipline, also used as probes for gathering in-field data about the design partners' approaches in designing.

4.4 Training formats

The second category is a set of different training formats. It includes:

- (a) theoretical experiences (i.e. theoretical seminars and theoretical/practical workshops);
- (b) design experiences (i.e. simulations of human-centred design processes through a learning-by-doing approach).

4.5 Projects

In the third category there are structured projects addressed to change a situation, piloting and developing design solutions. It includes:

- (a) pilot projects;
- (b) research and development projects.

5. Discussion

The identified strategy can be considered as a scale of complexity for (i) designing the strategy actions; (ii) transferring design knowledge to the local entities that do not systematically use design and (iii) understanding how the local entities generally design and what they need in order to introduce a human-centred approach to their design process (figure 5).

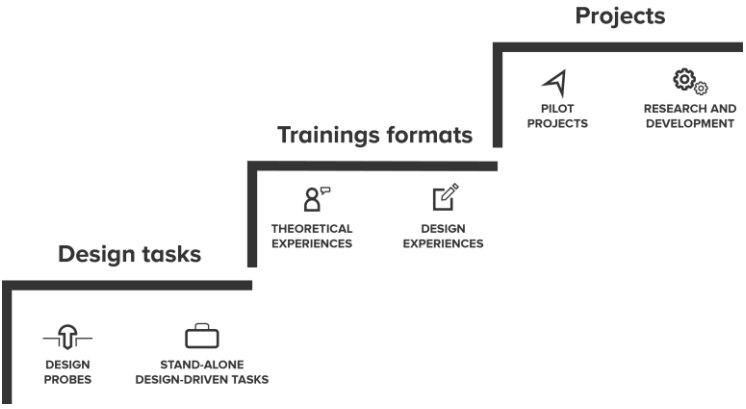

Figure. 5. The DKT scale of complexity.

As a discussion of the main result, the following reflections are related to the application of the strategy. In fact, from the knowledge transfer perspective it is still not clear if this strategy should be applied according to a specific sequence. The authors provide an early evaluation about this aspect in the following considerations:

- If the strategy is applied as a structured process according to a sequence of actions, its application starts from the design probes and rigorously follows the subsequent actions (figure 6). For instance, if the main goal is developing a pilot project, the design of this set of actions for DKT should consider specific actions that precede the pilot project in the scale.
- If the strategy is applied as a semi-structured process according to a sequence of categories, its application starts from the first category but not necessarily from the first activity of the category (figure 7). Therefore, while the sequence of the categories follows the steps of the scale, the sequence of the actions is randomized and it depends on a case-by-case evaluation.
- If the strategy is applied as an unstructured process according to any given sequence, the actions are applied randomly (Figure 8). This means that the sequence of the actions is collaboratively selected and designed case by case with the partner of the knowledge transfer through the design process.

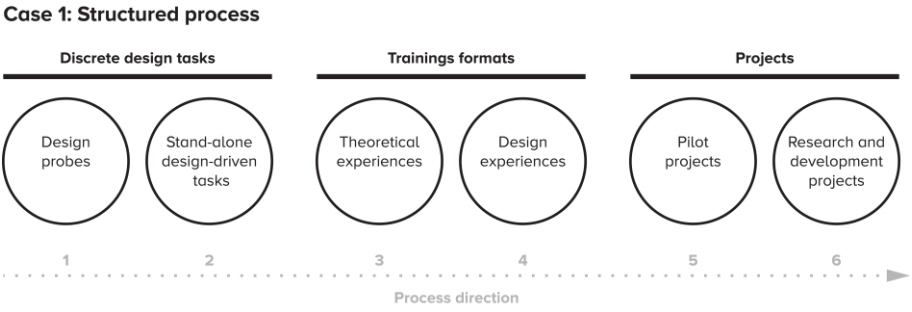

Figure 6. Case 1: structured process.

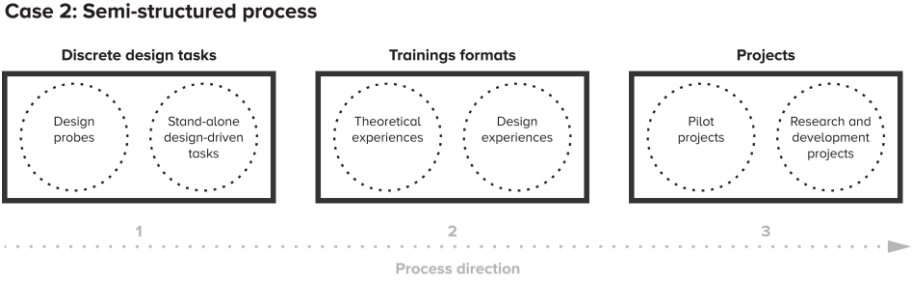

Figure 7. Case 2: semi-structured process.

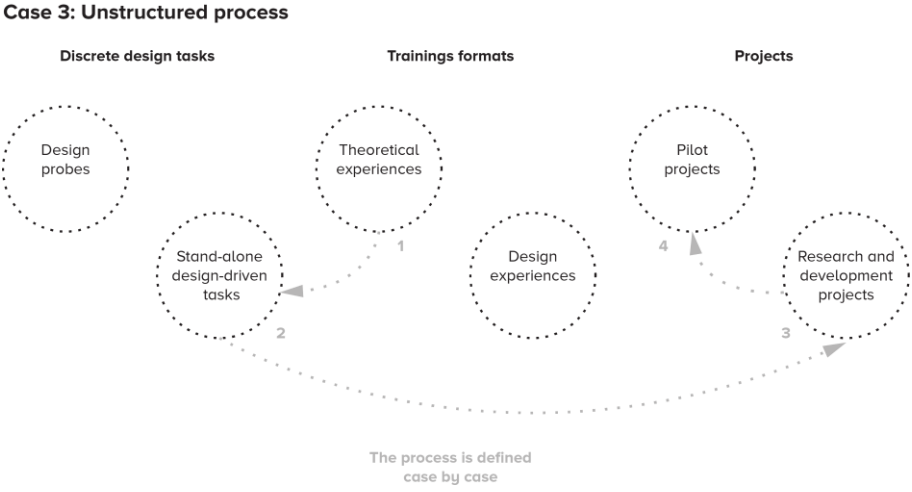

Figure 8. Case 3: unstructured process.

Every case presents advantages and disadvantages. For instance; the last case is the most participative and democratic among the hypotheses because it gives more decision power to the local agents.

However, according to the experiments conducted in the analysed lab, the actions of the macro-categories should be considered sequentially. Furthermore, it is still not possible to consider the strategy as a customizable instrument and additional data needs to be gathered through more in-field experiences. Moreover, according to the logic of the scale, all the activities can be considered a tool for probing the local contexts and refining the offering actions step by step.

From a practical perspective, if an action of a macro-category is assumed as the final objective of the transfer process, the previous actions need to be considered as previous steps of the DKT process. Every category is conceptually the container of a set of activities that work as medium for the DKT process with different levels of complexity. For this reason, the identified categories allow to apply a strategy for transferring knowledge through the practice of design.

6. Conclusions

In conclusion, according to the findings described in this paper, it is possible to proceed with experiments of democratization of design at local scale in the case that all the actions of the strategy are correctly applied by the identified sequence. However, this aspect needs more investigation and it is part of the agenda for future inquiries. For this reason, the strategy is actually adopted by the same analysed lab as its free offering system to be experimented with the local entities as an open-ended, inclusive, participative and free instrument for a design-driven local development in the three systems.

Also, the analysis of the lab as a case study for the democratization of the design culture, opened two working concepts that are (i) the DKT through design; and (ii) the democratization of the design culture through DKT. Both the concepts require investigations from a design research perspective envisioning an innovative conceptual framework. Indeed, the analysed lab is mainly adopting the RtD approach with the aim of transferring the design knowledge to the local systems. Therefore, the lab is adopting ‘research through design’ where for ‘design’ is meant the design of the 'knowledge transfer process'. As it is mentioned before, the 'DKT process' can be considered a 'DKT through design'. Consequently, the lab is following a ‘Research through Transfer through Design’ (RtTtD) approach for developing design research and democratizing the design culture.

Finally, a generalization of the RtTtD concept allows to conceptually envision its design research extension that is the ‘Research for/through/about Transfer for/through/about Design’. This can be the subject for future inquiries in DKT.

Abstract | In this study, we worked with Georgians coming to Ankara, Turkey as live-in domestic workers whose work and private life was tangled. There are many layers to investigate in this case, like the adaptation process to the new culture and country. Another layer is the transfer of knowledge and behaviours between home and migrated country. The design proposal we made with Plentifulness Cards aims to ease the knowledge sharing process and strengthen the relations between immigrant domestic workers so that the pro-environmental behaviours would be encouraged and spillovered from the private domain to the work domain. Narrating on this research through design project, the article demonstrates how boundaries between places, roles, and cultures can be reawakened and reshaped with the help of designed artefacts.

KEYWORDS | DOMESTIC WORKERS, IMMIGRANTS, PRO-ENVIRONMENTAL BEHAVIOUR (PEB), SPILLOVER, CULTURAL IDENTITY

1. Introduction

The increased pace of life and high workload change the everyday life patterns of individuals (Muster, 2012). As work and private lives interpreted with another, the line between them gets fuzzier. Dissolving borders have resulted in the diffusion of behaviours and values from the private life sphere to the work-life sphere and vice versa -as defined as spillover effect in the literature (Edwards & Rothbard, 2000). As one of the diffusing behaviours, pro-environmental behaviour (PEB) -actions that will benefit the environment or make the least harmful impact as possible (Steg & Vlek, 2009)- can be spillovered in different spheres of life. Elaborating the effects of the transgression of behaviours and understanding the motives behind the pro-environmental behaviours (Kollmuss & Agyeman, 2002; Steg & Vlek, 2009) of sustainability-oriented employees will be the topic of this paper.

Interestingly, in the case of the live-in immigrant workers, one place (house) becomes a setting both for work and private life, and these two became inseparable from the other, which lead us to focus on the spillover of PEB of immigrant domestic workers in this project. Almost all of the studies in the sustainable consumption in the workplace setting targets the office setting, and non-office work setting remained undiscussed. Because of this gap in the literature, we preferred to work on domestic workers' sustainable consumption behaviours.

This paper presents the process and outcomes of research through design project as a part of a graduate studio course in the Industrial Design department of Middle East Technical University. The research project aims to promote PEB of the Georgian domestic workers in Ankara, Turkey through design practice. The research questions of the project are:

1. How cultural differences between the worker and the employer affect workers' PEB in the case of an immigrant worker?
2. How the workers' PEB spillover when a place (house) becomes setting for different life spheres?

The topic consists of many different layers because it grounds where the boundaries between places (e.g., home, work, country), roles (e.g., householder, worker, immigrant), and cultures are highly blurred.

To find answers, we conducted field research with five Georgian domestic workers who live in their employers' houses as caretakers or helpers, using semi-structured interviews and observation methods. According to Nair and Little (2016), domestic workers' cultural background determined their behaviours and sustainable consumption patterns since consumption - which constitutes a critical role in the identity construction - can be traced back to the culture. Consequently, identifying the characteristics of this group; their educational, economical, family background, and the way they reflect their own culture and identity in "X" city become essential for the sake of this research.

2. Literature Search

This literature review will start with the definitions of keywords in this context, such as sustainable consumption (Cohen, 2001; Muster 2012), pro-environmental behaviour (Steg & Vlek, 2009), and spillover effect (Edwards & Rothbard, 2000). Next, sustainable consumption in the workplace setting will be examined as discussing the interactions between work and private life. How this interaction affects people's pro-environmental behaviour in different workplace settings (Kirk & Barton, 1982) will be discussed. Finally, it will conclude with underlining the knowledge gap in the sustainable consumption behaviour at non-office workplace literature.

2.1 Background of the Sustainable Consumption

Sustainable consumption has been defined differently by a myriad of authors, and there is a rich terminology used for describing similar terms. Sustainable consumption, (Cohen, 2001; Muster 2012), conscious consumption (Ellen, Wiener, & Cobb-Walgren, 1991), socially responsible consumption (Roberts, 1995), responsible consumption (Marchand & Walker, 2008) and green consumption (Nair & Little, 2016) are some of these terms used in the literature. Pro-environmental behaviour (PEB) is the term used by Steg and Vlek (2009) to describe the activity that aims to have a positive impact on the environment, or if it is not possible, do the least harm. According to Kollmuss and Agyeman (2002), PEB is a conscious act that is performed to reduce the negative outcomes of one's action on the environment. Although there is various terminology used to define sustainable consumption, they all indicate quite similar things that lead to PEB.

2.2 Spillover Effect

As Tudor, Barr, and Gilg (2007) highlighted, there are various studies on PEB in different settings, but most of them focused on the house rather than the workplace. Tudor et al. (2007) also stated that how environmental behaviour is affected when people change the setting from home-to-work or work-to-home has a little place for itself in the literature. In that point, spillover effect, which defined as the transfer of mood, behaviours, skills, and values from one domain to another (Edwards and Rothbard, 2000), is a valuable term to explain how PEB can spillover between homes and work settings. Viola and Ulf (2011) demonstrated that when environmentally friendly behaviour learned and performed in one domain, similar actions can be triggered and strengthened in the other domain.

As an extension to Viola and Ulf's (2011) assertion about spillover of people's environmental behaviour from private life to working life, Tudor et al. (2007) stated in his study findings that a strong connection between sustainable environmental practices of people in home and work settings exists; moreover, fundamental pro-environmental behaviours and values of people mainly determine that secure connection. Therefore, it can be concluded that spillover of PEB can be seen both from home to work and from work to home

2.3 Pro-environmental Behaviours (PEB) in Different Workplace Settings

In this section, sustainable consumption behaviours in the workplace setting will be discussed in two parts, which are office and non-office settings. Starting with the office setting, Felstead, Jewson, and Walters (2005) defined the office work setting as working in a defined place for a prescribed period -more specifically "sitting in an office, or at a desk, with a name-plate on it" (p. 2). Companies which operate in office-based settings develop strategies for promoting pro-environmental behaviour of their workers. Both employees and companies tend to perform PEB, and the motives behind these behaviours are examined by Harland, Staats, and Wilke (1999). They found that ethical norms are among the most critical motives behind employees' PEB in the workplace.

Even if it is limited, there are some studies on sustainable consumption behaviours in the office setting. However, in a non-office work setting, the examples are even fewer - almost none. Since the visibility of non-office work setting as a workplace is very low, we focused on this area. Therefore, in this part, a non-office setting will be investigated for domestic paid work, which breaks the boundaries between work and home since it keeps being a home for the house owner while it is a working environment for the domestic worker (Cox, 2013). In addition to the place, domestic work signifies different meanings for different roles. Cox (2013) stated that "The employment of paid domestic workers highlights the close relationship between consumption and work in the home. Work for one person, the employee, is the consumption for another, the employer." (p. 821). Additionally, Nair and Little (2016) looked from the perspective of sustainable consumption and said the roots of behaviours and sustainable consumption patterns need to be searched in the cultural background of people.

3. Methodology

We conducted field research with five Georgian domestic workers who live in their employers' houses. Two of the participants are taking care of older people, one of them taking care of a bedridden person. One of the participants is the helper for housework, and one of them is unemployed. We used personal connections and snowballing for recruitment.

In the study, interviews (semi-structured) and observation methods were used. Most of the interviews took around two hours; therefore, they were long and dense enough to comprehend the user group's characteristics and their approach to PEB. After the interviews, participants showed their house and their homemade products, which we talked about during the interview. Interviewing in their house and work environment during their work time was a challenge and an opportunity for us at the same time. It was a challenge since they must take care of their employers during the interviews. Consequently, interviews were interrupted a couple of times. On the other hand, we had the chance to observe them while

they were working and interacting with the employers and doing their regular work at the house.

After all interviews were transcripted, researchers coded transcriptions on hard copies, mostly using process coding and motif coding methods for analysing. During the coding process, the first and second cycle coding were used simultaneously because researchers had already known the data very profoundly from participating in all the interviews together and transcribing them in a short time. Therefore, finding connections and patterns between interviews was possible in the early stages.

4. Field Research

Data gathered from the interviews and observations helped us to understand the living conditions of a Georgian domestic worker in Ankara whose private life and work-life dissolve into one another. For that reason, we investigated the nature and level of PEB among these employees and its transference to other domains of their life (spillover effect). When we use the term PEB, we are referring to the behaviours that respect nature, producing on your own, buying locally, supporting drug-free agriculture and consuming natural products, and so forth. Questions were asked about resource consumption, waste management methods, repairing habits to learn the types of PEB that participants execute. After learning the types of PEB, factors affecting the spillover of it is examined comprehensively.

4.1 Types of PEB

As the interviews are analyzed, PEB of participants were gathered under the categories of cleaning, gardening, shopping, cooking, waste management, resource management, DIY, reusing, repairing, second-hand, homemade. Since some of the categories were emphasized more than the others, researchers chose five of them to work on, which are cleaning, gardening, shopping, cooking, and DIY.

To start with the cleaning category, participants were highly concerned with the hygiene of the house since they are working for people in need of nursing due to their age and sicknesses. They are both responsible for residents' hygiene and health and also house's hygiene and order; consequently, lots of different cleaning products are required, but some of them find a way to make their product to make it more "natural" and less "harmful" as they indicated. For example, P1 showed us her homemade cleaning cream consists of soft soup, hot water, and some readymade cleaning cream. Moreover, P1, P2 and P3 indicated that they are using white vinegar regularly for cleaning the floors, washing the curtains or disinfecting greens or vegetables. However, P2's employer does not approve the use of vinegar and wants her to use detergents instead.

When it comes to gardening, most of the participants seemed to had experience about it back in their home country: however, some of them cannot maintain their habit because (1)

in the migrated country they live in the crowded city where there is no place for gardening, (2) their employer does not want to consume vegetables grown in the pot, (3) or employer already has a gardener for these tasks. On the contrary, the ones who have access to soil, use this opportunity to grow their vegetables and herbs like P3 and in the case of P1 pick fruits from trees to make marmalade for the winter or let them dry for later consumption as P2.

When researchers asked their shopping habits, P1 stated her preferences for going to the bazaar for vegetables and fruits while buying eggs, milk, and related products from local producers, which she finds healthier and more natural than the market products. Also, P5 said that she is buying groceries from the bazaar with her employers. P3, on the other hand, used to buy from bazaar rather than market back in Georgia, but since she has a language barrier and does not feel comfortable communicating with stallholders, she preferred to go to the market in Turkey.

For the pro-environmental cooking habits, researchers found out that participants tended to use methods for containing food for longer periods of time, like preparing canned food such as pickles or making jams from the fruits in the employer's garden or simply drying the fruits. P2 stated that in Georgia, they are not used to find vegetables or fruits in every season, that is why they are canning or drying most of them at the end of the summer. It is seen that these behaviours are also taking place in Turkey where they are spillovered.

Lastly, within the DIY theme, participants' repairing and reappropriating behaviours are exemplified. For example, they are finding alternative ways of using old towels as a dust-cloth or making them cleaning gloves or using old clothes for patchwork, as in the case of P2. P5, on the other hand, said she is saving leftover soap pieces to make a mixture for washing clothes. P2 was also interested in repairing things in the house like a broken iron and a chair, while P1 also wanted to repair instead of throwing away but did not know how to repair broken stuff.

4.2 Factors affecting PEB

It is found that Georgian domestic workers living in the migrated country are having concerns like buying locally produced food, using "natural" and handmade cleaning products, decreasing waste by making second use of old, unused products, which are indicating that they have certain PEB that spillovered from their home country. These kinds of behaviours are mostly spillovered from their home/private life to work life, from their own country/culture to their new environment. While some of the participants easily keep practicing their PEB, some of them having difficulty to do so. Here in this section the factors affecting the PEB of Georgian domestic workers will be discussed. When data gathered from interviews is analysed, it has been found that there are several factors effecting PEB and its spillover which can be listed as follows:

Personal background of workers includes information about their family, education and worldview. Also, we found out that their settlement place in their home country have a significant effect of PEB practices. For example, if they were raised in the village, performing PEB is more likely compared to city settlement. In the village life they mostly have their own garden in front of their house where they produce their fresh food and use homemade goods for cleaning instead of buying commercial products. This is also related to financial concerns of participants which is another factor affecting PEB. They expressed that homemade products and producing their own food in the garden or in the pots are cheaper than buying from the shops.

Moreover, since they were using employers' money for shopping, they were feeling more cautious about spending it for house expenses. Situational factors cover the accessibility to farmer's market, availability of recycling boxes, and infrastructures related to gardening activities. Health concerns of workers related to cleaning of the house and food consumption were also affecting their PEB because they were responsible for not only their health but also residents of the house who includes ill or older people and children.

4.3 Someone between employer and family

The relationship between workers and employers can have different levels and modes. When employers provide a space for workers to express their personality and culture, workers feel belonging and commitment to their employers and consider them as their family. Therefore, worker-employer relation becomes a family relation. In the case of a positive connection between worker and employer, the employer can have different roles such as supporter, mediator, and teacher in terms of helping workers in the process of learning a new language and adaptation to another culture.
However, in the condition of a negative relation between Georgian domestic workers and employers, workers experience difficulty in performing their habits. The attitude of employers towards workers has a significant effect on employers' daily life practices. For example, two of the participants said that they had challenging experiences when employers have strict rules for their shower time and frequency and washing machine usage. Finally, it is seen that the relationship between employer and worker and matching or clashing personalities has a significant effect on the spillover of workers' behaviours from their life in the home country to the migrated country.

4.4 Somewhere between work and home

In addition to Georgian domestic workers' relations with their employers, they form an attachment to the house they work in. The mode of the link between worker and house depends on various conditions, and according to that, workers' behaviours change in the house setting. For example, one participant feels like the house is hers, and she prefers to stay there on her leave day instead of going out because she feels very comfortable in the house. Also, she hosts her guests at the employer's home. When it is the worker who

provides the order and control over the house, the possibility of spillover of her PEB practices is increased because the worker feels a kind of ownership over the house and feel free to express her culture and bring own practices to the house. For instance, a participant said that she brought special spices from her home country and used their traditional cooking recipes in the house she works. Also it is identified that if a worker lives only with the employer, work and home settings become more inseparable because she considers the whole house as living space. However, if relatives of the employer like grandson or daughter live together with them or stay over so often, the worker divides the house visibly as our bathroom/daughter's bathroom, as one of the participants stated.

4.5 Something between cultures

The transition between countries also means a transition in language, culture, and lifestyle. In the case of migrant domestic workers, adaptation to this transition can be challenging, especially in their first months of arrival. The adaptation process may even be longer since some participants feel insecure about their residence or work permit. To add more, having the language barrier to communicate with their employers makes it harder for a Georgian domestic worker to feel attached to this new country. It is found out that when it is difficult for the worker to reflect her own culture and identity, then the possibility of PEB spillover is less likely. On the other hand, when the workers are supported by their employer or by the other Georgian domestic workers in the same city in the process of learning the language and traditions, their adaptation period is faster and more peaceful.

Having (Georgian) friends and creating a network can help to promote PEB and spillover of them. To illustrate, P2 indicated that she learned a lot from her other Georgian friends over the phone or their weekly meetings on Sundays and exemplified as "I have learned that beans are served with pickles in traditional dining culture here thanks to my friends here". Also, knowing neighbours and expanding the network seemed to have a contribution for a better adaptation process. Again, P1 was telling us that their neighbour and market owner in the neighbourhood are mediators for giving leftovers to animals. Here is where we realize social relations and network effect PEB positively since it eases the sharing of tips and tricks, experience, methods, and knowledge -which have a significant effect on the spillover of PEB.

5. Design Phase

5.1 Plentifulness Cards

It is concluded that some Georgian domestic workers face the problem of reflecting their cultural identity and adapting to a foreign country's culture. In the adaptation process, workers' PEB is hard to spillover since there is a subtle conflict between employer and employee about having control and creating an order in the house. If the former has power,

then the latter has no space to keep up her PEB and culture. Contrarily, when the workers have a chance to share their knowledge and strategies about daily PEB practices with their employers and friends, the possibility of the PEB's spillover is more likely.

In order to ease the knowledge sharing process and strengthen the relations between immigrant domestic workers, which lead spillover of PEB, we developed Plentifulness Cards as a design proposal. We chose our target group as Georgian domestic workers in Ankara; (1) who live in the employer's house permanently and (2) whose working and private life become tangled.

We created the design process by setting our design brief which is informed from the field research analysis. Then, we developed personas for creating design ideas for our user group. Afterward, we made some mock-ups for promising ideas and took them to our participants for testing. According to feedback and further exploration of the concept, we improved our design proposal.

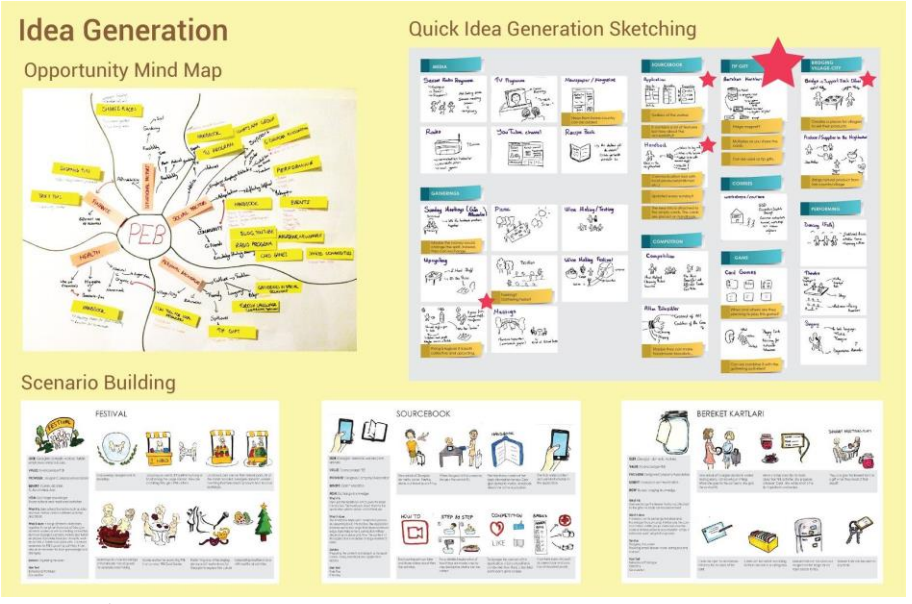

Figure 1. Idea Generation

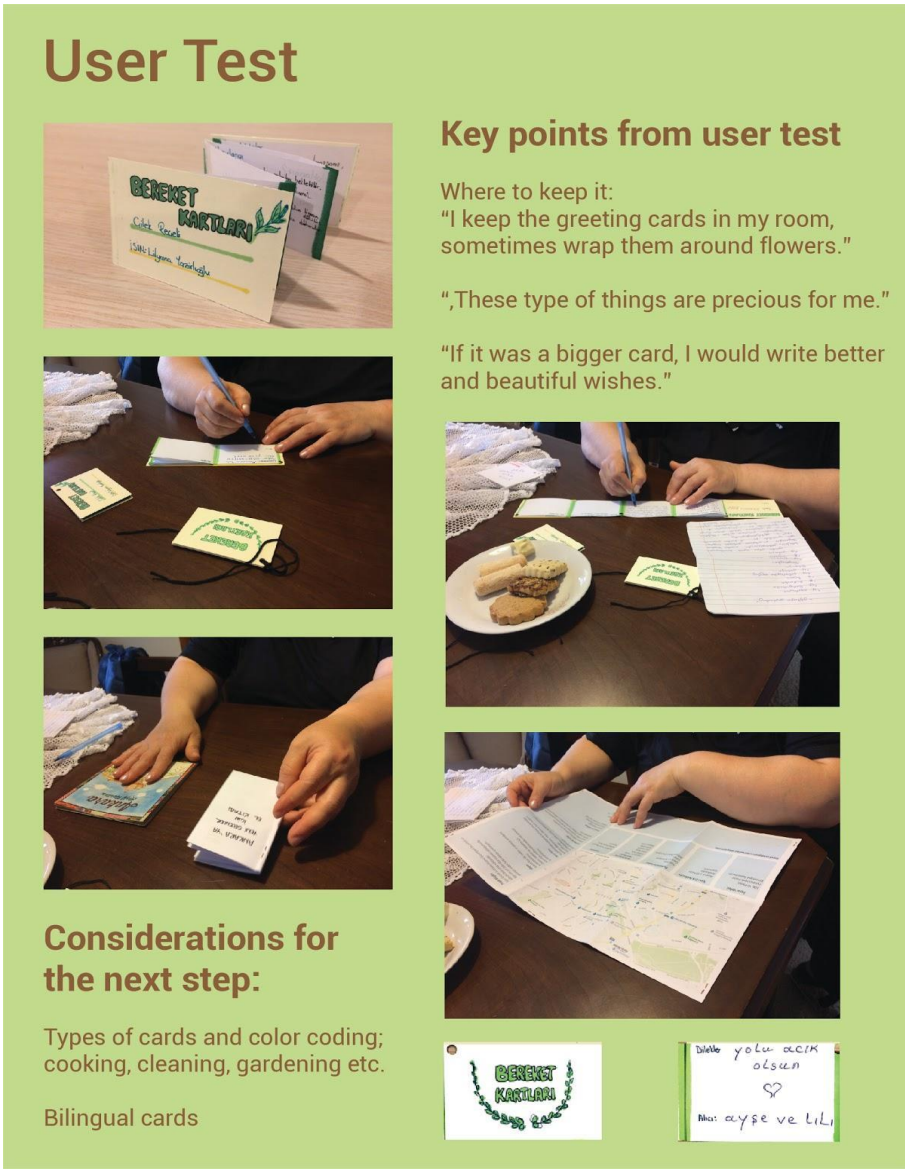

Figure 2. User Test

Cards are given in five categories: cleaning, gardening, DIY, shopping, and recipes which consist of tips and tricks about the new place Georgian workers migrated to and, more specifically, the neighbourhood they will work and live in. One can use the cleaning card for sharing the making process of natural cleaning handmade products: which ingredients to

use, how to make it and where to use it etc. With a gardening card, one can share her experiences and suggestions about these topics: what is the right time for planting, how to plant and how to grow it. The shopping preferences: where to buy fresh vegetables, where to find second-hand goods and more can be shared through that card while DIY card helps to share the knowledge about repurposing and reusing unused stuff. Lastly, recipe cards are for sharing the natural and healthy food recipes.

Figure 3. Plentifulness Cards

Each card is written in two languages -Georgian and Turkish. On the front page of the card, the category is explained and the postcard info is expected to be filled by the sender of the card. In inner pages following information is given: ingredients, how to prepare, where to use, the tips & tricks and lastly, the experiences of the sender while applying the recipe. On the back page, the Plentifulness Cards is explained, all the categories are shown and how to find these cards is described.

When it comes to the usage scenario, it all starts with the receiving of the Plentifulness Cards Box. They can be found in the companies which are mediators between Georgian domestic workers and their employers. Within the box, Plentifulness Cards and card display are found. In the cards, it is explained what these cards are for and how to use them. When a worker has something to share about her PEB activities, she fills a card and even can add a relevant gift to it. For example, if she is filling a gardening card about how to grow greenery in the pot, then she may also add some seed along with it. After filling the card, she can give the card to her employer, colleagues or neighbours. On the other side, as a card receiver, the worker can put her favourite card to the card display in various ways to try them later or keep them as memories. Moreover, if she has something to add to the card, there is a space for writing her own experiences about that recipe.

Figure 4. Usage Scenario

6. Conclusion Remarks

In this research through design project, we experience the strong connection between research and design phases and we benefited them iteratively. When design proposals are based upon the real connections between designer and people, ideas are articulated in a meaningful way. The design proposal we made by Plentifulness Cards aims to ease the understanding of status-quo rather than being an absolute answer to the problems that immigrant Georgian domestic workers struggle on. In a way, our role as designer was to be

the navigator of the complex situation, and we try to see the user as experts of their own daily practices and find a way to materialise the insights gathered from the users' experiences. Therefore designed artefact –Plentifulness Cards- was a tool to reflect on the problems and communicate with our user group more easily without a barrier. Because we experienced some limitations like participants' insufficient knowledge of Turkish language. Also, they mostly feel insecure about us questioning their work in a migrated country. Also, we could only reach Georgian domestic workers who have better living conditions and the number of participants was limited. Since we had restricted time for the project at the time of the course, we did not allocate more time for increasing the number of participants. Therefore, that topic can be further studied with more Georgian domestic workers since it is such a fruitful area for including different actors, cultures, and lifestyles into the research through design area.

Design projects as drivers for organisational change in the public sector.

Abstract | The demand of a new generation of public services is leading to a systematic exploration of what design can do for public organizations. The article presents and discusses, through the analysis of two design projects conducted in the Municipality of Turin, a design-based theoretical framework for organizational change based on the conduction of long-term processes of engagement and exposition of public sector employees to the design culture.
The two cases show that the growth of innovation capacity in the public sector based on service design practices must consider the necessity of coping with long-standing challenges, i.e. the innovation of/in public bodies; the peculiarities of organizational learning processes and of the absorptive capacity of the organizations; and the overall resistance to change in people and organizations.

KEYWORDS | PUBLIC SECTOR INNOVATION, CO-CREATION, ORGANIZATIONAL CULTURE, EXPERIENTIAL LEARNING, INNOVATION CAPACITY, DESIGN THINKING

1. Introduction

Confronted with a range of complex challenges, public administrations (PA) are faced with increasing pressure to improve their innovation capacity (Cavenago et al., 2016; Potts & Kastelle, 2010). The emergence of the "co-society" paradigm, nurtured by open innovation and digital technologies, has given way to completely new citizen behaviours (Geraud, 2016), such as mobilization for the "commons", data sharing and service sharing. Hence, the user is no longer simply a receiver or a spectator but an actor (Fluicity, 2015). This new trend is questioning both the decision-making and the implementation processes in the public sphere and is putting increasing expectations of greater citizen participation in the design and delivery of public services meant to address societal challenges that require new solutions.

As a response to these challenges, many PAs have introduced design practices as a tool, with a particular emphasis on the development of a more citizen-driven approach to innovation in order to build a better society (EU commission, 2013; Bason, 2010; Puttick et al., 2014; Tõnurist et al., 2017).

However, many barriers continue to prevent the development of an agile citizen-centric approach to innovation.

The difficulties and barriers that arise from public bodies adopting new and alternative principles like co-creation that are rooted in design and represent a more "horizontal" approach, are notably linked to their complex, vertical and often fragmented structure as well as their organizational culture.

Participatory activities for their nature contain a high potential to tackle exactly this complexity faced by governments and public institutions. Moreover, they have the capacity to include unused knowledge and ideation resources into innovation processes despite - or exactly because of - their contrasting nature, typically clashing with the existing culture and processes. On the basis of these premises, we argue that the focus on end-user/citizen's innovation skills (Bason, 2010) to address the need for an agile and citizen-centric culture in PAs poses the problem that little reflection is being made on how public organizations can internalize and integrate the new knowledge, and how the transformation process can be fostered or managed: this omission could easily lead to reject the new practices, or confine them to a cosmetic role (Deserti & Rizzo; 2015).

In this article the authors present and discuss the results obtained from a long-term programme of design projects that they are developing in the Municipality of Turin.

The programme is based on the assumption that the introduction of a user centric innovation culture (Deserti & Rizzo; 2019) in the public sector can rely on developing a long-term process of interaction between the culture of the public sector and the culture of design.

In the following, the theoretical framework at the basis of the implementation of the design programme in the Municipality of Turin is presented. Consecutively, the development of the programme through the implementation of two projects is discussed examining the results with respect to the previous findings and the theoretical framework. Finally, conclusions are identified for the long-term experimentation and validation of the framework.

2. Expanding innovation capacities in the public sector through Design Thinking

Even though there are evidence of an increased rate of experimentation of user centred innovation methodologies within the public sector (Bouwman & Grimmelikhuijsen, 2016), it remains unclear under which conditions these become institutionalized practices. How organizational environments authorise and legitimize innovation practices by way of learning and education remains one of the most relevant challenges. To address this issue, the authors propose a programme of design projects that relies on the idea that introduction of innovation capacities in the public sector, should be based on their practice, or else in a learning-by-doing framework that can be complemented with reflection to achieve a sustainable transformation. This is not only in line with generic organizational learning principles (Schein, 1999), but also with the construction of innovation knowledge and culture, which is historically bound to practice. In such a context, the role of experience, a core ingredient of the design disciplines, can be regarded as key to knowledge creation and appropriation.
The programme under development in the Municipality of Turin proposes to combine advanced human centred service development with a learning framework to set up a learning environment (Beckman & Barry, 2007) in which to make possible for a range of diverse actors operating in the organization to experience the processes of innovation. Design Thinking (DT) is particularly effective in this perspective because of two main reasons:

- it grounds the innovation process in co-design activities that are human centred and involve multiple actors and perspectives, which is not only useful to better develop new solutions, but also to enable interaction, sharing of information and mutual learning.
- it is based on an experimental design/prototype/test/redesign loop that can be effectively connected with triple loop learning, which is particularly valuable within complex settings and organisations.

DT is today becoming a mantra in the different areas of innovation (Owen, 2007), including social and public-sector innovation (Manzini & Rizzo, 2011; Deserti & Rizzo, 2015). Design-led innovation approaches are currently being experimented to tackle societal challenges, trying to better manage complex participatory processes involving many actors and stakeholders in a frame of tensions or open conflicts. These processes go beyond the established principle of designing for context-dependent problems, extending the idea of participation to include: 1) the relationship between the context of the problem to be addressed and the design of the network that will co-produce the solution; 2) the experimentation of different configurations of that network until a robust partnership is individualised and established in some institutional form. In this perspective, DT emerges as a suitable approach to user centred innovation.
The DT innovation cycle is based on 2 main pillars: (i) a human oriented approach to innovation that considers the end users of the solutions those who possess the fundamental expertise on the problem/challenge to be solved; (ii) a context based approach to innovation

that considers actors from the external environment as well as the tangible and intangible PAs infrastructures and resources (people, processes, technologies, procedures, knowledge) as enablers or barriers to innovation (Deserti & Rizzo, 2019). DT pursues the activation of the ecosystem as strategic in the process that move from innovation ideation to its real implementation. The design programme developed for the Municipality of Turin interprets the real practice of the iterative design cycle as key for the introduction of design methodologies and tools to support the development of a co-creation culture in public organizations. To reach this objective, the programme integrates the DT methodology, in the form of an iterative design cycle, with Kolb's (1984) model of experiential learning. In other words, the programme is based on the idea that design-led innovation processes can be exploited to set up and pilot experiential learning within organisations.

3. The Design Programme in the Municipality of Turin

In the following sub-sections, the description of two design projects implemented by the authors in the Municipality of Turin are reported. The projects have been conceived as a learning by doing experience: the adoption of the DT cycle (from ideation to implementation) for the development of two new services has been observed and monitored as a process of implicit development of innovation capacity in the Municipality. Impacts affecting both the culture of the organization and the competences of its employees have been detected and are discussed in section 8.

3.1. First project. TO-Home: a service for vulnerable citizens at risk of eviction. 2016-2017

Turin is the third largest Italian city well known in the world as the hometown of FIAT automobiles. The crisis of the automotive sector that started in 2007 led to the delocalisation of the production and to a relevant increase in the level of unemployment, which has become the biggest challenge for the city. Under these premises, one of the objectives of the Municipality in 2017 was to develop TO-Home a service meant to responds to the complex needs of vulnerable citizens at risk of eviction (families or individuals that received an eviction notice or are at risk of receiving it) due to insufficient income. Politecnico di Milano mentored the Municipality through a service co-design process as a way to develop innovative solutions based on an integration between the employment, housing and social services, which are traditionally approaching the risk of eviction with different perspectives (a labour issue vs. a housing or a social one). The mentoring run through 4 phases: analysing the challenge, envisioning new solutions; detailing the design, prototypes. In phase one participants were supported to understand the challenge from the end user perspective. In the second phase participants were guided to the envisioning of new solutions with end users and the co-design of initial concepts for the new service. In phase 3 the focus was on moving from ideation to implementation in the context of the

organisation. The last phase included the support to prepare the tender to implement the service and the design of the service experimentation with end users. The analysis of this first experience shed light on a few critical issues: (i) the employees' difficulty in assuming the point of view of the end users as an alternative perspective from which to analyse the current services and design the new one; (ii) the employees' difficulty in overcoming internal resistance to change and barriers bound to the current organizational structure; (iii) the employees' difficulty in reconnecting the design of the new service with its real implementation. In particular, during the design of the service blueprint - the synthesis tools used to represent the final configuration of the service - participants were unable to come out with effective solutions to four main problems, which could ultimately affect the delivery of the new service:

1. Individualising competences of the operators that should deliver the new service.
2. Making the service visible and how to communicate it to the end users.
3. Obtaining the availability of enough houses to accommodate fragile families.
4. Engaging the users of the services in co-production mechanisms.

3.2. Second project: the redesign of the register services. 2019-2020

Being reputed one of the Italian excellent centres of innovation, the Municipality of Turin aims to improve the general access to fundamental services for citizens, also providing new ways of accessing them remotely. The Central Register Office in Turin provides a range of services directly to the citizens that involve a wide range of public entities at the regional and national levels. Services provided regard the civil status, the registration and change of residence and the issue of identity cards. Offering a range of fundamental services not just for Italian citizens but for all residents in the city, the context is multi-ethnic, multilingual, and hosting citizens of all ages. Following the growing need of citizens to carry out procedures remotely, different from most other Italian cities, several services to the citizens are offered online supported by the national digital authentication system, but the system still lacks integration with the services provided on-site, that are left behind. Having a strong connection behind the scenes of on- and offline procedures, conflicts cause all operations to slow down or face obstacles. Long waiting times for service delivery are paired with more practical problems on site linked to the building itself, its organization, and spaces. Having been constructed as a psychiatric hospital the monumental building has been reconditioned to host the central public offices of the registry office. Hence the architectural structure of the building itself bears a challenge in managing and organizing the spaces according to its new purpose without changing the landmarked structure itself. The project aims at facilitating the citizen's access to the offered services and the comprehension of the procedures. The project, divided in different phases starting from an introductory workshop with employees, followed by a period of user research, further workshops to co-create the new services with the stakeholders and a final phase of development and implementation.

The potential and critical issues identified in the first project conducted in 2016-2017 have been used as a foundation of this new one. Having already gained a set of insights on existing and potential barriers in the systems of the Municipality, a knowledge base was available for the set-up of the following activities. Different from the first project, the second one, extensively reported in the following, is aiming at improving and eventually complementing a wider range of existing services in the Registrar's Office in Turin.
The entire project is informed by different techniques of co-design applied to innovation in the public sector following 4 key principles:

1. Co-design with users
2. Analysis of the context of interaction
3. Approach based on piloting
4. Service design as a driver for organizational change

3.2.1. Project description

The entire project is oriented towards a redesign of the access to the public services in the central Register's office in Turin set up as collaboration between Politecnico di Milano and the Division of Innovation of the city of Turin.
The reason for this is that major difficulties have been found in citizens facing difficulties in identifying, accessing, and comprehending the services leading to dissatisfaction and confusion. The main services provided by the Register's office are the change of residence, the issuing of identity cards and official certificates. The services are offered in the central office in the city centre and 13 smaller, decentralized offices in the city. All these services are producing documents do not just allow citizens to identify themselves and benefit from other services in the city, but the services themselves, their organization and planning is therefore closely linked to various entities and designed and delivered by different and specialized team of employees not connected among them. These highly specialized teams are usually focused on one specific element rather than working in groups with mixed competences. With respect to these observations the aim, beyond improving the actual services, is breaking out from old schemes of designing services and introducing new ways and instruments that are following the key principles described in the previous chapter.
The project for the register office was set with a duration of 13 months, from January 2019 until February 2020 including execution and testing. The objectives were on one hand to redesign the access to the services provided in the building while introducing competences for design-driven innovation and collaboration across co-design processes inside the organization. The project developed from 2 initial assumptions coming from literature (Cilliers & Greyvenstein, 2012; Stone, 2004) as well as from the evidence of the first project:

- the quantity of the entities necessarily involved in the entire service delivery is one of the main barriers in adapting to change.

- the strong organizational culture characterizing public services based on silos is completely opposite to the principles of design.

The second project was also meant as a learning environment were to cope with these two main barriers to transformation. The entire project is divided in three main phases, now only the first 2 have been implemented specified as:

- Research and design.
- Execution.
- Piloting and testing.

3.2.2. Project outputs

As an outcome, three of the four suggested dimensions of intervention have been tackled. The first one linked to the physical space that creates discomfort for users and an improper working environment for operators. Dividing the spaces of the operators strictly from the waiting areas the issues with privacy, noise and distress are tackled (Fig.1). A system of digital and physical wayfinding is creating a friendlier atmosphere eliminating handwritten notices and supporting the user in finding his way through the labyrinthine building (Fig. 2). To support comprehension and transparency, the forms have been redesigned (Fig. 3) indicating the important elements for the user supported by an informative leaflet with a checklist of documents applying gamification for assistance throughout the procedure.

Figure 1: Waiting room developed for the intervention in space

Figure 2: Wayfinding system designed to improve the communication on-site

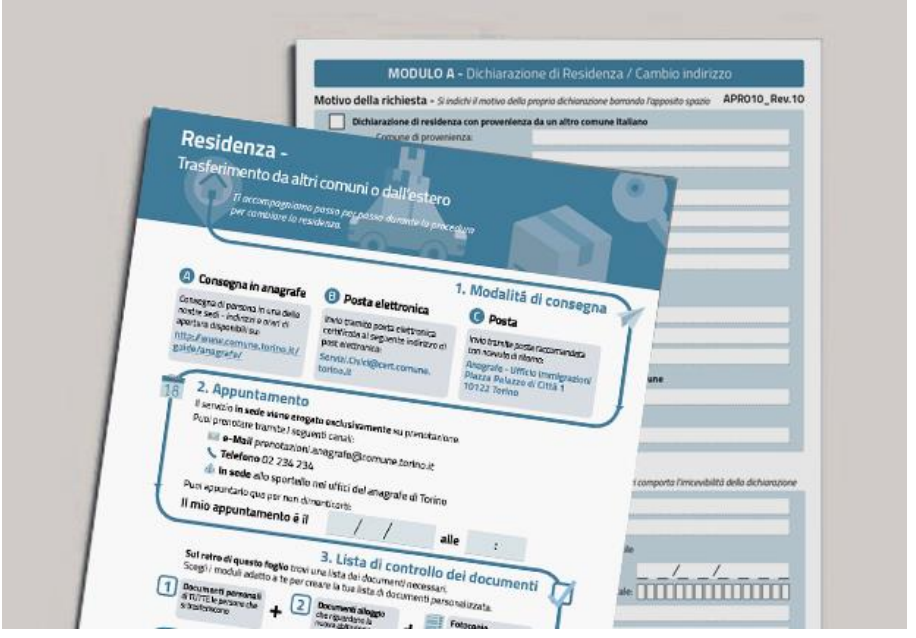

Figure 3: Form and leaflet guiding through the procedure

4. Main findings and issues emerged

Especially the research phase and the transition from design to implementation shed light on some issues demanding a closer look and analysis. Already the initial research phase zoomed in on the disconnected and highly fragmented structure of the public office that later appeared to be interconnected to several other obstacles found during the process. Some of these elements are listed in the following to be then explained further:

- Vertical hierarchical structure.
- Missing culture of holistic planning.
- High specialization.

For the first insight the authors notice that the structure being organized in a strictly vertical hierarchy did seem to hinder the building of new capacities especially at the level of civil servants. Having the impression of being purely executing other's decisions and plans has found to be a barrier to the building of new capacities. Building the team/s with the skills and motivation to develop the solution/s was one of the biggest challenges for the project. The employees who had actively participated in the workshops did not feel enough incentive to keep developing the solution deciding to take a role in driving the development. In this second project the development of the innovations was taken on by a smaller group of actors, who were willing and asked to commit to a longer-term process of developing and testing the innovation. The larger groups of employees that participated in the phase of ideation did not take part in that of implementation, not only due to their will but also to the sheer lack of resources and the need to employ them in day-by-day practices. As consequence the project failed in creating a sense of ownership as the level of engagement decreased moving from ideation to implementation of the innovations. In particular, the top management of the register officer became the leader of the project. This insight reflects a larger issue in the process of co-creation, which often sees the phase of ideation being characterized by an intensive and active involvement of all the actors while - as soon as the process moves to implementation - decision, responsibility and power remain in the hands of the top management, impairing the opportunity to transform the organizational culture (Sangiorgi, 2010).

The second insight talks about the absence in the Municipality of a systemic approach to innovation at the level of the middle management, which could help oversee complex processes and think across organizational silos. Instead, an established approach to fragmenting and splitting competences and roles has found to be one of the main barriers in the adoption of the design culture, which claims holism as one of its pillars (Stickdorn, 2011). The redesign of the register office has been based on the attempt to match the grassroots experimentation with the larger strategic vision of the Municipality of introducing a user centric prospective in which the public actors, the citizens and the local stakeholders work together in envisioning and co-producing new solutions. This attempt has been driven by the

strategic dialogue with the top management of the organization and the Deputy Major to innovation. The implementation of this strategic approach has, in turn, questioned the cultural transformation of the organization as the development of new skills among staff and workplace innovation called for a need to overcome silos. The insight then shows that having a strategic vision and a plan to implement it can be not enough if the introduction of the new knowledge is not complemented with the management of systemic and organizational change.

The last relevant point the authors identified is the evidence that high specialization of departments, typical not just for public organizations (March 1991), hampered the adoption of different points of view (e.g. the perspective of users or other stakeholders) and the capacity to consider all necessary factors. This difficulty to change the perspective from where to develop services is closely linked to an issue that emerged mainly in the implementation phase of the project, i.e the non-perception of the various parts of the project (as those presented in figures 1, 2 and 3) as interconnected elements of a whole to create a coherent experience for the citizens. The management of the register office has in fact decided to significantly modify what has been designed together with the researchers and the designers in the phase of ideation due to insufficient budget available for the implementation (the budget could not be defined in the beginning, even though the whole project was conducted with a “frugal” approach). Furthermore, extant public procurement procedures obliged to split the execution in parts realized by different subjects, which require a high level of attention and holistic coordination not always applied due to the necessity to involve different areas that are used to work in an independent fashion. The interconnection of the various elements and its importance for the functionality of the designed experience has hardly been perceived mainly because of the lack of experience of the management in new service implementation. As already seen in the first project, the passage from ideation to implementation (Deserti & Rizzo, 2018) is rarely run relying on internal competences of public organizations. The pervasive adoption of externalization as a strategy to cut costs in the public sector has negatively affected the capacity of the employees to follow a cycle of design-implementation and redesign, transforming them in mere executors of solutions conceived and implemented somewhere else. In quite a few cases, the same execution is externalised, leaving the organization with fairly limited knowledge about some of its processes. In this case especially the struggle to allocate human resources, overcome unplanned architectural hurdles and retrieve financial resources for the realization of fundamental elements of the service experience notably impacted on the executive phase and showed the difficulties in linking and uniting the research phase with that of project development and with putting ideas into effect.

5. Conclusions

This article discusses a design-based theoretical framework to face organizational change by conducting long term processes of engagement and exposition of employees from public sector organizations to the culture of design. The framework combines advanced human centred service development (DT) with a learning framework to set up a learning environment in which to make possible for a range of diverse PAs and actors to experience processes of innovation, building knowledge and fostering organizational change. Considering the results of the experimentation conducted so far, and connecting them with existing knowledge, the authors recognize that the development of credible pathways and effective actions to support the growth of innovation capacity in the public sector must consider the necessity of coping with long-standing challenges, i.e. the innovation of public bodies; the peculiarities of organizational learning processes and of the absorptive capacity of the organizations; and the overall resistance to change in people and organizations (Albury, 2005; Brown & Osborne, 2013; Sørensen, & Torfing, 2012). The approach proposed shows that a possible solution to this problem is to reduce the gap between the strategic management and governance structures of public organisations and the everyday implementation of innovation by developing internal processes, spaces, procedures, profiles within public organisations to better integrate the two levels. This reflection will be at the core of further experimentation, for which the authors are currently preparing new research and innovation proposals, which will integrate the proposed design and learning framework with an organizational change framework.

About the Authors:

Felicitas Schmittinger is a research fellow at Politecnico di Milano in the Department of Design graduated in Product Service System Design with a research thesis focussed on the introduction of design techniques and tool in organisations. She worked on projects in healthcare and the public sector exploring the influence of design and organisational learning. She is part of the EU-funded research project SISCODE and a teaching assistant in the Department of Design.

Alessandro Deserti is full professor and head of the Department of Design at Politecnico di Milano. His research is focused on design-enabled innovation processes, methods and tools, with particular reference to their introduction in new fields and to the ways in which their adoption can be combined with systemic and organisational change. He has been actively working a researcher and coordinator for various EU-funded research projects.

Francesca Rizzo, Ph.D., is Full Professor at Politecnico di Milano, Department of Design where she teaches User Centred Innovation and Digital Design Studio. She is expert in Participatory Design applied especially on the fields of: service design, interaction design, social innovation and public sector innovation. She has been actively working as researcher for various EU-funded research projects and is author of many international publications in Journals and conference in the field of design research.

Design when you are the other 90%, a student's perspective

Kyle Graham Brand

Tshwane University of Technology
brandkg@tut.ac.za

Abstract | *Design for the other 90%? Design with the other 90%?* But what does it look like when you are the other 90% trying to study design? South Africa is rated as one of the most unequal countries in the world resulting in the 'other 90%' sitting side by side with the '10 percent' posing many challenges for educators. This paper interrogates the strategies, to assist disadvantaged students, implemented by an Industrial design program in South Africa, by hearing from the students and looking at projects. Lessons are captured around the topics of access, teaching and exposure. The area where the most opportunity for change appears to be is how themes, in a project-based pedagogy are chosen. A *project determination model* is proposed as a result and aims to produce more contextually diverse topic themes in Industrial Design education, making projects easier to engage with and improve learning for all students.

KEYWORDS | DIVERSITY, OTHER 90%, EDUCTION, PROJECT-BASED LEARNING

1. Introduction

Design as a profession has seen a growth trend toward human-centred, socially cognisant design processes and solutions. This could be described as a culture shift in design, from a focus on elite solutions to more democratised human-centered, self-directed solutions (Campbell, 2017, p. 31). In many ways answering Papanek's call for design to solve real world problems (1984, p. xv). Many designers, design programs and design firms have begun to, and do tackle problems which typically fell outside of formal design practice. Some of these, bottom of the pyramid, design challenges and solutions were captured in the exhibition, and accompanying publication, *Design for the other 90%* (2010). This was then further humanised by a Cumulus Conference hosted in Johannesburg which borrowed and adapted the title to *Design WITH the other 90%* (Breytenbach & Pope, 2014). This conference and accompanying exhibition showcased various projects and strategies which saw design practitioners designing alongside the communities and people who the solutions where intended for. Although Sanders and Stappers show that co-creating as a design approach has existed for some time, but has been slow to be adopted (2008, p. 7). As they note it requires "… that one believes that all people are creative" (Sanders & Stappers, 2008). This concept is furthered by the book by Ezio Manzini, *Design when Everybody Designs* where Manzini shows that designer's roles are becoming more how to assist others in designing better (2015, p. 2).

But what happens when the 'other 90%' are coming into the world of the '10 percent' and are now being taught design? What does design, or more specifically design education look like when you ARE the 'other 90%?' The context in South Africa is somewhat unique as a result of high levels of inequality (World Bank, n.d.). Using the terminology of 'the other 90%', there exists two parallel worlds of both '10 percent' individuals and 'other 90%' often side by side. This has become particularly evident in the tertiary education sector where there has been increased access to tertiary education by previously disadvantaged individuals (van der Berg & Gustafafsson, 2019, p. 34)(Padayachee, Matimolane, & Ganas, 2018, p. 289), i.e. 'the other 90%'. The specifics of this dichotomy between the '10%' and the '90%' would be impossible to define as the concepts of rural and urban are somewhat underdefined (Atkinson, 2014, p. 5), with people moving between and still remain connected to rural areas even if they themselves are 'urbanised'. However, many of the students who hail from more rural backgrounds face many challenges when coming to study design. Limitations in terms of exposure to technology, formal design and the economic challenges, have many consequences. These 'other 90%' individuals should be considered valuable as they can spread a culture of design, with its potential for bringing meaningful change, in areas seldom reached by the '10 percent'. There is the potential that these students could present an opportunity to adapt and extend the 'design with' approach taught in industrial design programs in South Africa (Campbell, 2008, p. 97). Some of these students have an experiential understanding of some of the typical challenges that many of the 'bottom of the

pyramid' projects aim to address. But with the odds stacked against them, how can those from rural areas, enter, learn and then bring about considered change (design) in the areas they hail from?

The tendency is for these students to transform and conform, thereby assimilating into the '10 percent'. However, this misses the opportunity for design to have a distinctive positive impact, and even be transformed by those doing it, both as a profession and in the training thereof. These students could be some of the "lay-designers" Campbell refers to (2017, p. 31). Improving access to formal training could lead to professionals from marginalised communities helping those communities design better.

This paper investigates the case of some students, who could be described as coming from the 'other 90%'. These students come from more, rural areas in South Africa, but through mostly state funding systems were given the opportunity to study Industrial Design. The dramatic leap in exposure and learning that was required of these students, meant their journeys were not simple. For example, a student not having used a computer prior to the first day of class, is still expected to do 3D parametric computer modelling within six months. These students are not unique, with urbanisation and development in the global south, prospective students will continue to come from rural areas to cities for education, so this phenomenon is likely to increase. However, this inequality between the students who might be sitting side by side in class poses many challenges. As an Industrial Design program, various strategic choices have been made to address this diversity and inequality in terms of culture, exposure and wealth.

In order to refine and possibly improve these strategies feedback from the students was used. One could describe it as: redesigning, Industrial Design education with the 'other 90%', even if only in a small way. Various lessons are extracted and grouped into three themes: access, teaching and exposure. Some projects are also used as examples.

2. The University and Program

The Tshwane University of Technology is one of the biggest contact universities in South Africa, accepting about 60 thousand students annually (TUT, 2020). Located in the city of Pretoria also has geographic implications. As the most northern city of Gauteng, which is the most populous and urbanised province of South Africa (GCRO, n.d.), Pretoria, acts as a kind of gateway for the more northern provinces which are generally more rural. This has the potential implication that many of the students who attend the Tshwane University of Technology come from these rural areas.

The Industrial Design program was started in 2008 with the first graduates qualifying in 2010 (C Duff, personal communication, February 13, 2020). As a relatively young program with a focus on innovation and entrepreneurship, the program aims to produce graduates who have both theoretical and practical understanding of design. The emphasis on making and

the practical application of knowledge necessitates workshops, equipment and materials. In order to best accommodate students, especially those relying on student loans or bursaries (many of the disadvantaged students are often from more rural areas) the strategic choice was made to include as much of the costs as possible into the formal fee structure. This then reduces the need for students to go out and buy their own materials and these can be bought in larger quantities thereby reducing costs.

In order to increase exposure and access, the program aimed to provide each student with a workstation which includes a desk, computer with all the relevant software, and internet connectivity. The rest of the studio environment includes printers and scanners, 3D printers (although their use is restricted to specific projects) and what is called the *concept lab*. The *concept lab* is located adjacent to the studio and is a 'light' workshop with basic equipment. Then during working hours students have access to a workshop with a range of equipment for prototyping in wood, plastic, foams, metals etc. They also have access to a shared lab, which is loosely based on the FabLab principles and includes a flatbed CNC router and metal cutting laser. Specialised labs and equipment from other departments, can also be accessed for specific projects, resulting in the students having access to an enormous range of facilities. The acquisition and development of the facilities has been part of the strategic drive of the program since its inception with the aim and hope that students will be able to learn better, with greater access to equipment and facilities.

The teaching approach of the program is predominantly project-based. English and Kitsantas note that this type of pedagogy is useful for knowledge acquisition and in "supporting the development of important real-world skills such as solving complex problems, thinking critically, analyzing and evaluating information, working cooperatively, and communicating effectively" (2013, p. 29) which are all skills useful for Industrial Design graduates. Although it does rely on self-directed learning and motivation (English & Kitsantas, 2013, p. 131). The relatability of a project theme could be a factor influencing student motivation. This project-based learning is conducted in an environment like the studio-based teaching strategy used by many architecture schools (Kuhn, 2001, p. 349). The students spend most of their time in the studio area, at their workstations or in the various workshops, with the offices of the lecturers adjacent to the studio so that students can easily access to teaching staff. The projects that are given to the students are determined around specific learning objectives and planned and adapted continually. The learning objectives are defined as the *factors of design* originally defined by lecturer Philip Oosthuizen. These factors are use, business, manufacture, environment, society and design expression. Projects almost always include prototyping and 'real-world' testing as a focus of the teaching strategy.

3. Interrogation of Strategies

The program has been in existence for just over 10 years, it was therefore time that these strategies were interrogated. Also, as a result of student protests in 2016 there were many

calls to decolonise curricula (Padayachee et al., 2018, p. 289). Although the project-based teaching pedagogy of the industrial design program, teaches graduates many skills that allows them to adjust to the changing contexts and conditions that Padayachee et al. refer to (2018, p. 290), it was also important that the themes of projects also be contextually relevant to students.

In order to interrogate these, a series of informal discussion with students were conducted. Initially a key student, who has completed their undergraduate studies, was consulted on the concept of being the 'other 90%'. This student, who can be described as coming from the 'other 90%', was the student referred to in the introduction who had not used a computer prior to the first day of class. This student then recommended other current students who could also be described as coming from the 'other 90%'. The study is qualitative as it relied on the experiences and perceptions of specific students. Therefore, the lessons and recommendations cannot be applied universally although they still provide specific insights into how these strategies are working for the students they are aimed at.

The discussion questions were grouped into the themes of access, teaching and exposure. Students were often asked to give examples of projects, so that the lessons extracted can influence the types of projects given to the students in the future, and with that the teaching within the program. All participants had limited or no exposure to using a computer prior to coming to study (Participants 01, 02 & 03, personal communication, February 6, 2020). For many the exposure and use of the equipment was also a first time (Participants 01, 02 & 03, personal communication, February 6, 2020). As noted, these students come from a spectrum of rural to urban with those who participated coming from more rural environments. For example, one participant explained that where he grew up had unpaved roads and they still relied on wood fires for cooking as electricity was only recently implemented in the area (Participant 02, personal communication, February 6, 2020).

4 Access

The access to the studio environment was considered important although it was identified that the high level of exposure can have the potential to be a distraction. Students who did not have access before, and now have unlimited access, are potentially more susceptible to the distractions associated with the internet and digital media (Participant 02, personal communication, February 6, 2020). However, it also true that those with limited exposure to computers need more time with computers to 'catch up' to their more privileged, peers (Participant 01, personal communication, February 6, 2020) making this access very important.

The integration of the costs into the fee structure was seen by all participants as valuable and important (Participants 01, 02 & 03, personal communication, February 6, 2020). One participant noted that it is not just the costs associated with purchasing materials themselves, but also the ability to transport the materials. As most of these students would

have to use public transport (Participant 01, personal communication, February 6, 2020). Having access to these materials without having to bear the costs directly, means students have scope to make mistakes, remake and refine although this can lead to wastage (Participant 02, personal communication, February 6, 2020). This aspect of being able to make mistakes and learn from them, is a major motivating factor for the cost integration, as it aligns with the programs *DESIGN, MAKE, TEST, REFINE* (Brand, 2018, p. 91) process. This is a typical iterative design process and relies on making and testing.

The close integration of the teaching staff and students is also seen as important as the participants noted the relational nature of the program (Participants 02 & 03, personal communication, February 6, 2020). The small class sizes in the industrial design program (not more than 30) allows for what is described as "… makes us like a family… you are close to us, you can see if someone is lacking" (Participant 01, personal communication, February 6, 2020). This appears to be particularly important as it was repeatedly noted that students from more rural backgrounds are apprehensive and possibly intimidated or overwhelmed (Participant 01, personal communication, February 6, 2020). Implementing systems and processes that encourage this relational attribute of the program is important to overcome these potential hurdles for the students.

5 Teaching - Projects

The project focused teaching with its' practical, making implications appears to be valuable and relatable to students. The familiarity with, what is being asked of the students to design, seems to either hamper or encourage students in those projects (Participants 01, 02 & 03, personal communication, February 6, 2020). Some of the projects highlighted as examples:

5.1 The Walking Stick Project

Figure 1 Walking Stick Prototypes - photo by author

The students referred to this project as a more neutral project where almost everyone would be familiar with the concept of a walking stick (Participant 01, personal communication, February 6, 2020). The original brief for this project asked students to design 'a device for assisting someone while walking'. This broadened what could be interpreted by the brief and did not limit the solutions to only walking sticks. This project aimed to teach user interfacing elements, as well as wood working skills and the properties of wood and its potential uses. The relatable nature of the project meant students could easily engage with the theme and only needed to overcome specific challenges around materials and interfacing using prototyping (Figure 1).

5.2 Rotation Moulding Competitions

Annually, the Association of Rotation Moulding in South Africa runs a student design competition (Armsa, n.d.). The competition is integrated into the curriculum for second year students. Participants noted that the potential for the students to learn and do well in the competitions is linked to how familiar the students are to the brief theme. For example, one of the briefs looked at sport (in general) as a theme for the project. This was cited as relatable and therefore easier to engage with by participants (Participant 01, personal communication, February 6, 2020). In contrast the theme of 'the beach' was not very relatable as many students, living in inland areas, had not seen or experienced the seaside (Participant 01, personal communication, February 6, 2020). This lack of experiential

understanding of the context and theme for the project put 'other 90%' students at a distinct disadvantage.

5.3 Umqombothi (traditional beer) bottle

The intention with this project was to teach principles of size and proportion as well as volume. The brief specified that students design a bottle for traditional African beer. Most of the students, who could be described as 'other 90%', have real-world experience with traditional beer. This, therefore, put them at an advantage and even meant their more privileged peers consulted them for information and insights. Participants highlighted this project as an example where they could better relate and therefore engage more easily (Participant 03, personal communication, February 6, 2020).

5.4 The Rocket stove project

Figure 2 Double Plate Rocket Stove Prototype, February 2020 – Photograph by Author

Initially inspired by the Tshulu stove project (Makonese & Bradnum, 2017, p. 21), which was exhibited at the *Design WITH the other 90%* exhibition. This project aimed to embrace the concept of Design when you ARE the other 90%, by relying on students who have experienced the context where these wood fire stoves might be used. Students were divided into groups, consisting of both 'rural' and 'urbanised' group members. This distribution was self-determined by the students. Students were given the internal functional element of the stove, based on the dimensions and functional strategies of the *Tshulu stove,* defined by the lecturer in consultation with Chris Bradnum, the designer of the Tshulu stove. However, the

stove was made into a two-pot version, as it was evident from the 'design with' research conducted in the development process of the *Tshulu stove* that often households needed to cook in two pots simultaneously (Makonese & Bradnum, 2017, p. 22). Students were asked to design and prototype the rest of the stove, including the interface and insulation (Figure 2). This project was one of the first experiments of a 'design when you are' as opposed to a 'design with' project brief. This needs to be further interrogated as a potential strategy for future projects.

6. Exposure

Students find visits to manufacturers and other excursions valuable (Participants 01, 02 & 03, personal communication, February 6, 2020). One observation noted by participants was the ability to talk to those working at a manufacturer in their home language (Participant 01, personal communication, February 6, 2020). These factory workers likely have a tacit understanding of a manufacturing process which they are then able to explain in a local dialect, thereby removing jargon and translations issues for students for whom English is a second language. This is a valuable insight as often the hosting individual taking students on a tour is not necessarily from a disadvantaged background and would be using primarily English to communicate. Requesting that student be allowed to interact more directly with those working at a factory is something that should be implemented.

7. Lessons

It appears many of the interventions are helping, even if only in a small way. Most of the students considered themselves to be at an advantage when comparing themselves to peers studying in other programs (Participants 01, 02 & 03, personal communication, February 6, 2020). The lower student numbers contribute to this, it should therefore be retained, as far as possible. The infrastructural challenges associated with providing adequate levels of access, in order that the 'other 90%' individuals have ample opportunities to catch-up, will always be present. The factors influencing these would be financial, institutional policy and simple practical implications of available space. Although many of these factors fall outside of the immediate control of the staff team, it should remain a strategic drive of the program and opportunities should continually be sought to improve access.

As noted above the value of excursions and visits to industry are clear. However, enhancing and encouraging interaction between the students and those on the 'factory floor' is something that should be further explored.

The area with the most opportunity for change, and the easiest to effect, is that of the projects given to the student as part of the teaching strategy. The projects need to be looked at in terms of their relatability and accessibility, in addition to the teaching objectives

already established. Figure 3 is a proposed *Project Determination Model* based off the lessons of this research. Previously projects were predominantly determined by teaching staff members, with the staff member relying on historical precedents of projects and often choosing themes for projects haphazardly, mostly focusing on the teaching objectives. Often better projects were developed mostly as a result of the experience of the lecturer designing the project. This model provides a series of questions and a way to compare project briefs so that a diverse range of projects are developed not just in terms of teaching objectives, but also the thematic attainability of the project. Thematic attainability refers to the level at which students can actively engage with the project theme. A more diverse range of projects, in terms of theme, can easily be argued as fairer as well as better for learning.

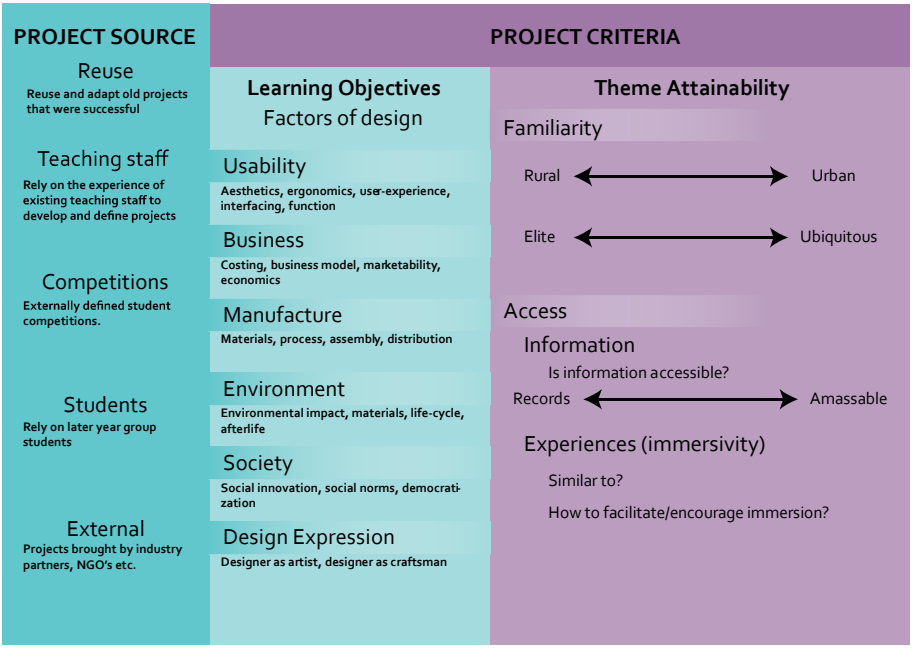

Figure 3 Project Determination Model – Illustration by author

Looking at the model the first column is the *project source*. This is where or how the idea for the project originates. The different listed sources have their advantages and disadvantages but, by using a combination of these would once again result in better more diverse projects. Currently the project source strategy relies predominantly on reuse, teaching staff, competitions and external entities. The addition of students is something that will be implemented as a result of this paper. A system for project suggestions, based on specific teaching objectives, will be developed so that later year group students (who have already completed the proposed project, during their previous years of study) can propose project

themes. The hope is that unique and relatable projects will emerge. The teaching staff will have to then look at these proposals and adjust them as needed to fit with learning objectives.

The next column is the learning objectives. These as described earlier are a broad grouping of the various factors that influence the value of a design solution. Addressing these factors in various projects is, in effect, a key teaching strategy of the program. Interrogating these specific teaching objectives is not within the scope of this paper, but they are included in the model as they are currently used to determine projects.

The last column *Theme Attainability* was a major addition to the model. Here the theme of the project is dissected in terms of how relatable it is, as well as, how accessible it is to students. While interviewing participants, the relatability of a project (with its context) was a factor identified as making a project easier or more difficult to engage with, especially for students who could be considered as from the 'other 90%'. The second attribute of access was determined from an example given by one participant. Recounting a project where they were tasked with designing wall sconces, the participant noted that hardly anyone knew what it was (Participant 01, personal communication, February 6, 2020). However, after being encouraged to search for images of wall sconces, they were able to quickly understand what it was and design accordingly. This example highlights the importance of access to information. Can information on the design problem be found? This information should not only be recorded information (books and internet), since self-amassed information is equally valid, and it would also teach students basic research skills. Another aspect of access is how accessible the context is for immersion and thereby allowing for experiential understanding of a problem or context. Using the example noted earlier of the project with 'the beach' theme. Effective immersion for inland based disadvantaged students was impossible. However, by asking the questions 'what is similar?' and how do you 'facilitate/encourage immersion?' will draw focus on the actual accessibility of the theme. This might mean the theme needs to be altered or designed around a specific immersion experience made available to students. Asking these questions, as part of the model means the selected themes for projects should have a wider variety. It could also have the effect of expanding the contextual scope of projects, thereby improving learning for all students.

Conclusion

Design, despite its increased humanisation and democratisation remains somewhat reserved for the wealthy or elite. Training and equipping students who could be described as 'the other 90%' is a strategic opportunity for a culture of design to spread in contexts that have little exposure to formal design. However, these students do face many challenges and need assistance. The interventions already implemented by the Industrial Design program are helping but could be further refined and adapted. The themes for projects appear to be the areas where the most change can occur. The *Project Determination Model* aims to address

this by drawing specific focus on the theme attainability of a project. By better selecting more diverse themes for projects, the culture of design, as a result of the complex proximity of the 'other 90%' alongside the '10 percent' could change for the better.

Abstract | Many studies have demonstrated the importance of considering the physical environment, more specifically classrooms, as a significant factor of influence in academic success and educational experience. Within a social justice in mind, this paper presents a case study on furniture design in Québec's (Canada) public elementary schools conducted over the past two years. The results show that classroom design is categorised by a spectrum of flexibility, from a classic layout to a flexible one. Issues of a variety of furniture models, overloaded classroom and disappearance of places for pupils are observed in classroom. While flexibility is important to consider in the design of a classroom, it must also be organized in such a way as to avoid excessive spatial and visual complexity. Therefore, it would be necessary to introduce a greater concern for harmonization as social justice principle into classroom and furniture design.

KEYWORDS | FURNITURE DESIGN, ELEMENTARY SCHOOL, SOCIAL JUSTICE, INCLUSIVE DESIGN, CLASSROOM DESIGN

> "The evolution of a school system can only be properly directed if we begin by knowing what it is, what it is made of, what are the conceptions that underlie it, the needs it meets, the causes that have given rise to it. " (Durkheim, 1999; 123)

> "Spatial innovations, detached from their pedagogical sources and justifications, pose more problems than they solve[wind]. " (Derouet-Besson, 2000; 27-28)

1. Introduction

Many studies, including the work of Peter Barrett at Salford University in Manchester, have demonstrated the importance of considering the physical environment, more specifically classrooms, as a significant factor of influence in academic success and educational experience (Barrett & al., 2019; Barrett & al., 2015). Barrett and Zhang (2009) indicates that the layout of a classroom should allow it to be adapted by a variety of teachers with specific, yet diverses groups of pupils. In this sense, a newly built school must account for the adaptations that take place in its spaces and classrooms. Only when spaces are conceived to support learning and creating a positive experience for both pupils and teachers can it be said to have been successfully designed (Barrett & Zhang, 2009).

Based on teachers' and pupils' perspectives regarding their classroom environments, Pointon and Kershner (2000) find that classrooms often reflect teachers' different pedagogical visions. Thus, the design of classrooms is generally left to teachers; and yet, by overlooking idiosyncracies, an apparent consistency emerges between the desire for flexibility in spatial layout, according to activities, the spatial and visual complexity of classroom environments more generally.

According to Barett and Zhang (2009), the flexibility of elementary classroom layouts has a significant impact on learning. The level of flexibility of a classroom is related to the degree of adaptability that the space offers in accomplishing the various pedagogical activities undertaken at any given time. The level of complexity of a classroom's layout refers to the way in which the different elements of classrooms combine to create visual coherence and a structured environment. For example, Barrett and al. (2015) estimates the impact of spatial and visual complexity in classroom layout on pupils learning at approximately 12%, with flexibility of layout accounting for 17%. In this study, they also mentions organization as a meaningful factor to be considered. Roskos and Newman (2011) reports that the quantity, arrangement and organization of physical space influence human behaviour.

Therefore, while flexibility is important to consider in the design of a classroom, it must also be organized in such a way as to avoid excessive spatial and visual complexity.

More than the design issue, as the school system in Québec is mainly public funded, it must provide pupils from all backgrounds an equivalent learning environment that supports their

success. In this sense, furniture design in elementary schools should be oriented to support social justice as much as it can be.

> "Social justice may be thought of simply as "the common good through the equalization of goods or services" (Sadeghi and Price, 2007: p. 4), or it may be more elaborately defined as "the fair distribution of opportunities, rewards and responsibilities in society, as well as principles and institutions for the distribution of meaningful social goods – income, shelter, food, health, education, the freedom to pursue individual goals (Hudson, 2013: p. 432)" (Barak, 2015).

With this perspective in mind, this paper presents a case study on furniture design in Québec (Canada) elementary schools conducted over the past two years.

2. The Context

SCHOLA is a 5-year, $2.5 million research project funded by the Ministry of Education and granted to a team of researchers at Université Laval (Québec, Canada). Led by Carole Després, professor at the School of Architecture, the ultimate goal of the research project is to develop a decision-making platform for school architecture and design based on scientific evidence (Després & al., 2016).

There are more than four thousand school buildings across the province of Québec. Facilities and infrastructure are aging and have reached the end of their useful life. The majority of elementary schools were built during the baby boom period between the 1940s and 1960s.

In response, the Québec government has recently undertaken an ambitious school construction and renovation project with major investments planned. These initiatives are part of a new Policy on Educational Success (MEES, 2017).

With the evolution of society and repeated reforms brought to the public education system that beginning in the 1960s, and which include the improvement of programs, the gradual inclusion of women into the labor market, the introduction of school daycare services, as well as the challenges related to integrating pupils with special needs and immigrant populations, schools are under increasing pressure to allocate their space in a functional way that take into account a wide range of needs (Després & al., 2017).

To meet these transformative challenges, the SCHOLA team has been formed to bring together researchers with expertise in architecture, design, education and partnerships from the educational, associative and professional sectors.

3. A Case Study of Furniture Design in Elementary School

3.1 Mixed Methods

The research adopts a comprehensive perspective and an inductive approach to portray classroom environments in relation to the educational experiences of teachers and pupils (Bisson & Gagnon, 2005). Based on an inventory of furniture in 66 classrooms in 19 elementary schools and semi-structured interviews with teachers, pupils as well as non-teaching staff, the team identified several issues related to the diversity of the facilities and furniture found in classrooms. A questionnaire for a web survey was also developed and a codesign activities with pupils. The web survey collected responses from 496 teachers from across Québec based on a simple random sample.

Table 1. Data collection

Methods	Sampling	Type of data collected
Inventory of furniture	66 classrooms	Type and number of furniture classify by seating, work surface, storage and communication material Description (material, colors, manufacturers) Good or bad conditions (needs in terms of repair)
Non-participant observation	19 classrooms	Space configuration grid, sketch and note of the uses of spaces and furniture
Teachers Interviews	19 teachers	Classroom layout, furniture appreciation and educative experience in general in relation to material resource in the classroom
Pupils Interviews	19 pupils	Classroom layout, furniture appreciation and educative experience in general in relation to material resource in the classroom
Codesign activities with pupils	48 pupils	Prospective activity – designing their ideal desk and chair
Management staff interviews	8 managers	Issues of acquisition
Material resource department director interviews	7 directors	Acquisition and maintenance issues
Concierge interviews	6 concierges	Maintenance issues
Daycare service	1 educator	Sharing resource material, acquisition and maintenance issues
Web Survey	496 teachers / n=195 schools	Classroom layout and furniture appreciation, use and needs

The inventory method allowed to collect more than 2000 objects that were grouped into categories. In order to classify the numerous models, a characterization system has been developed, based on a syntagmatic relationship analysis of the objects whose main components that define them were divided: seating (seat, back, leg and glides), work surface (table top, leg, cabinet storage and glides), storage (cabinet, opening and glides) and communication material (format, orientation, support and chalk rail). An observation grid has also been developed to sketch class configurations. In order to facilitate the understanding of the educational experience, i.e., what is happening in the classroom, as well as the perception of these activities by teachers and pupils, 2 hours of non-participant observations were conducted. This observation period was followed by a semi-structured interview with the teacher and a selected pupil.

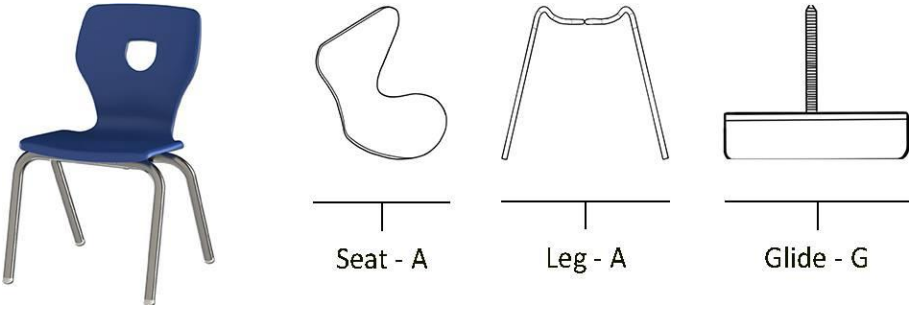

Figure 1. Syntagmatic analysis of seating. Source: Schola. Université Laval. 2019 ©

4. Results

The article will focus on general results. The codesign activities and experience of comfort are detailed in the study conducted by Coulombe-Morency (2019), the analysis of learning spaces are detailed in the study by Rousseau (2020) as well as the analysis of wall displays by Cadoret (on going).

4.1 A spectrum of flexibility

Classroom layout in Québec schools is characterized by a spectrum of flexibility:

- from the classic classroom with a row desk layout,
- to the semi-flexible classroom with several dedicated areas for educational activities and a cluster desk layout,
- to a flexible classroom with a zonal layout and no place assigned to pupils.

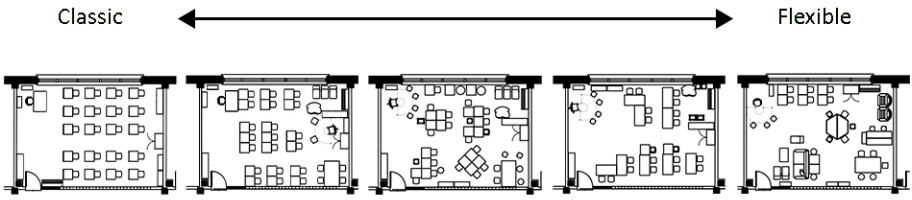

Figure 2. Spectrum diagram of classroom layout types, from classic to flexible. Source: Schola. Université Laval. 2019 ©

Classrooms are generally organized into activity zones, the number of which varies according to the uses of the space: teaching space, teacher's space, computer area, reading area, documents area, assembly area, active work zone, storage, collaborative work area.

Figure 3. Different areas in one of the classrooms visited. Source: Schola. Université Laval. 2019 ©

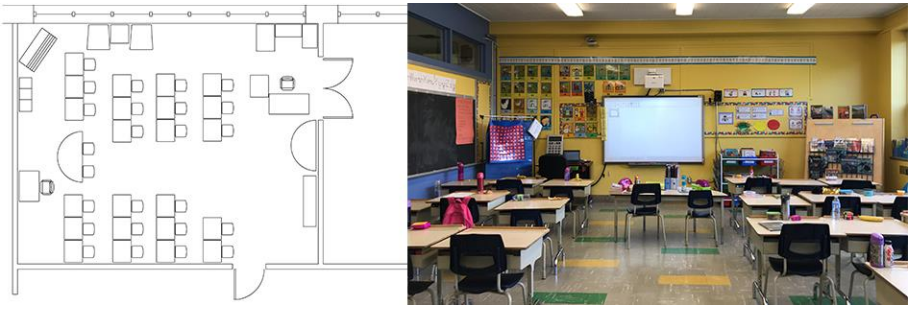

Figure 4. Layout diagram and picture of one classic design classroom. Source: Schola. Université Laval. 2019 ©

A. Classic layout

The classic classroom layout is composed of furniture that can be described as traditional. It primarily consists of desks and chairs arranged in rows facing the teaching area and the communication board. Dedicated areas either are absent or very modest in the room, the teaching (or learning) space being largely occupied by individually assigned desks, i.e. the pupil's is typically assigned a desk, with the pupil's name on it, at the beginning of the school year. Furniture is relatively homogeneous with little variety with respect to seating and work surfaces.

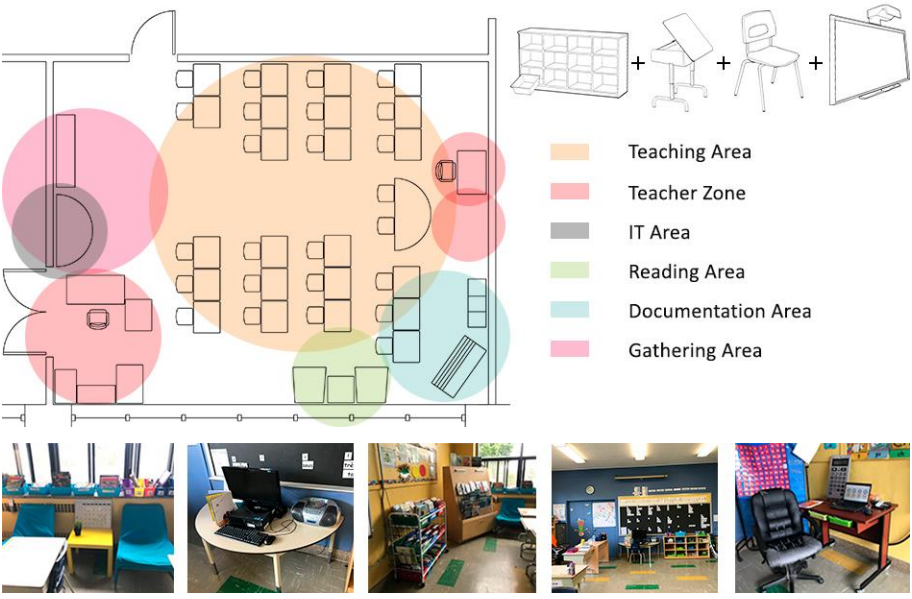

Figure 5. Some dedicated areas of the classic layout and their typical school furniture. Source: Schola. Université Laval. 2019 ©

Issues of classic layout classroom:

- The layout offers little or no recess space.
- The pupil can easily identify with his/her own desk, but little with the rest of the classroom.
- Little or no space for collaboration, but desks can be grouped together for this purpose as needed.

Figure 6. Some issues observed: wrong chair/desk combination, wrong stool/desk combination, need of elastic band, difficult to use storage and tray falling over. Source: Schola. Université Laval. 2019 ©

B. Semi-flexible layout

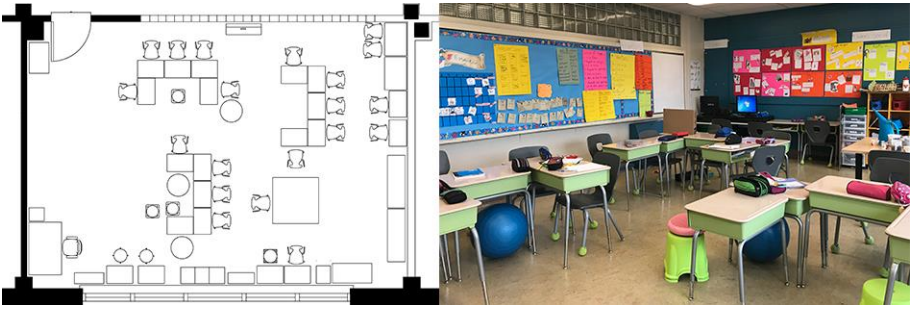

Figure 7. Layout diagram and picture of one semi-flexible layout classroom. Source: Schola. Université Laval. 2019 ©

The semi-flexible layout is a hybrid between classic and flexible layout. These classrooms tend therefore to be very distinct, but have similar characteristics, such as: 1) the presence of a desk and a chair for each pupil (although not necessarily assigned to each pupil), 2) a variety of seating and work surfaces, and 3) dedicated areas are more common and occupy the extra space left vacant by the tighter grouping of desks. In addition to the traditional furniture of the classic layout, there is also furniture for moving around (stability balls, wobble stools or floor seat), various objects imported from the domestic milieu, including tables and additional storage to meet the needs of a larger number of dedicated areas.

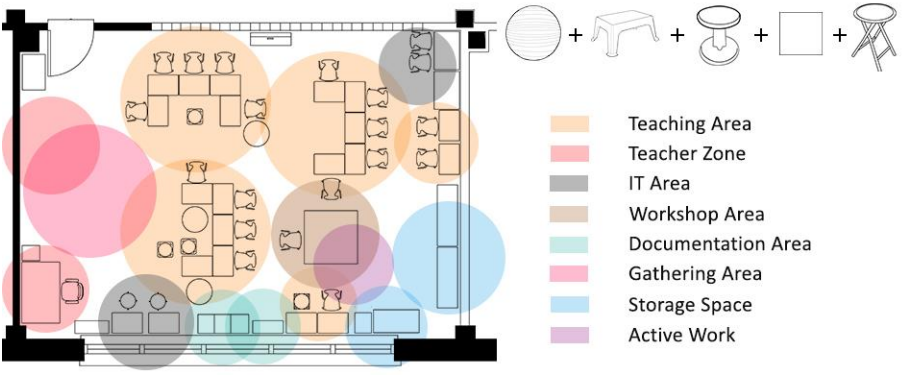

Figure 8 . The semi-flexible classroom layout with additional furniture that are added to those present in the classic classroom. Stylistic referents from the domestic milieu and sporting environment are added to the classroom. Source: Schola. Université Laval. 2019 ©

Issues of semi-flexible layout:

- The introduction of additional zones causes distinct challenges for class management.
- The variety and quantity of objects in the space complicate the layout of the classroom both visually and functionally.
- Although the semi-flexible layout responds to all the functions of the classroom, there is no prioritization or hierarchy of its functions in space.

Figure 9. Some issues of the semi-flexible layout: overcrowded desks, need to add dividers for evaluation, bed lifts, different heights of work surface. Source: Schola. Université Laval. 2019 ©

C. Flexible layout

Figure 10. Layout diagram and picture of the flexible layout classroom. Source: Schola. Université Laval. 2019 ©

In contrast to the classical classroom at one end of the spectrum, the flexible classroom marks a disruption in the spatial organization of a classroom. There are only a few pupil desks and few or no chairs with typical scholastic references. The flexible classroom is characterized by the presence of a variety of seating and work surfaces of varying heights and dimensions. The school-type objects of the classic layout are abandoned in favour of furniture found or acquired by the teacher's own means, often coming from the sporting or domestic reference environments.

Issues of flexible layout classroom:

- The management of space has to be well structured by the teacher as pupils constantly change place. Some use a privilege system to grant place to pupils.
- The management of place by privilege could be discriminatory for some pupil.
- Some scholastic desks are reserved only for pupil with learning or adaptation difficulties and located apart in the space.
- Sharing the space, material and the equipment at the school material resource management are difficult. Introduction of distinctive models of furniture and very personal layout designed by the teacher is a problem of material resources management.

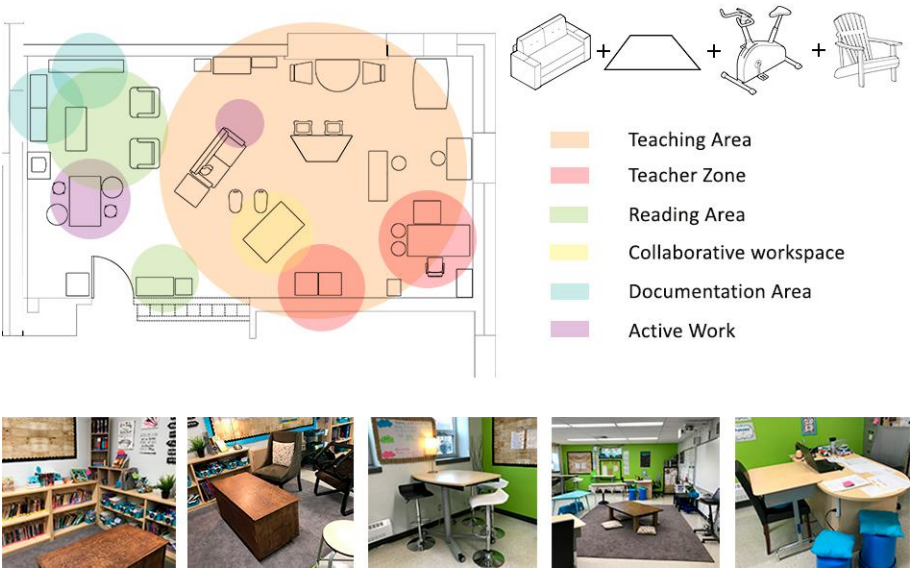

Figure 11. The flexible layout: household objects are more present in a flexible classroom than objects with scholastic references. Classroom has a very wide variety of seating arrangements. Pupils do not have a chair and a desk each. Source: Schola. Université Laval. 2019 ©

Figure 12. Some issues related to adjustment when writing in flexible layout classroom: in a bean bag, collaborative work in a couch, writing on an armrest, diversion of use and poor fit. Source: Schola. Université Laval. 2019 ©

4.2 A variety of furniture models

As the analysis of inventory confirmed, different stylistic references of school furniture appear in classroom layouts.

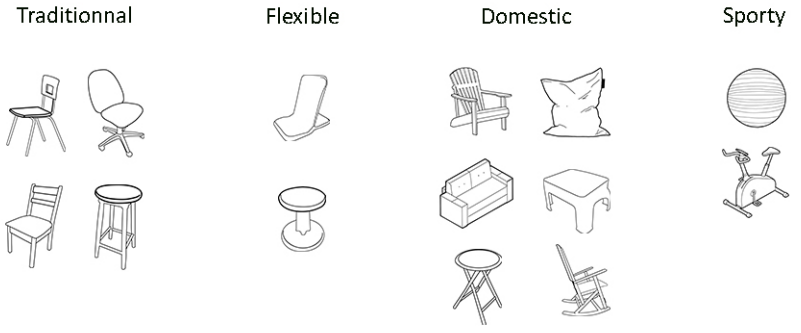

Figure 13. Diversity of furniture in the classroom. Source: Schola. Université Laval. 2019 ©

The traditional one refers to the kind of furniture that are generally associated to school and office: standard pupil chairs and desks, stools and teacher chairs and desks. Nevertheless, a new trend was observed in classic classroom: some teachers use some stability balls, wobble stools or floor seat to replace regular chair.

With the semi-flexible and flexible classrooms, two new stylistic references are incorporated in the layout: domestic furniture like sofa and ottoman and sports accessories and equipment.

The identification of different models in the space, according to the categories of objects, also appears problematic. For example, on average in a single classroom, it is possible to find 6 different models of chairs, 6 different models of tables, 5 different types of displays, and 9 models of storage units. The figure below shows the number of models observed according to the types of objects categorised in one classroom.

Table 2. Number of different models of furniture in one classroom

	Seat	Work surfaces	Communication material	Storage	Partitions
Minimum	3	3	3	5	0
Mean	6	6	5	9	-
Maximum	15	12	9	22	2

4.3 An overloaded classroom

In addition to this, spatial organization is becoming more complex with the addition of dedicated zones. The semi-flexible classroom is being the most crowded with furniture.

A high visual load is also apparent through the many posters, display surfaces and decoration that leave little unused space and a rather dispersed visual organization. The team is currently completing the analysis of the visual organization of the walls displays based on visual parameters such as complexity level (quantity and organization), relevance (utility and quality) and flexibility (functionality and adaptability). The preliminary analysis shows a high to medium level of visual complexity in the room design. While studies show that a low to moderate visual load is desirable to promote attention and concentration, we observe a physical and visual over-crowding of the space generating impacts with respect to comfort (especially ergonomic issues and postures), maintenance and attention (Barrett & al., 2015; Fisher & al., 2014).

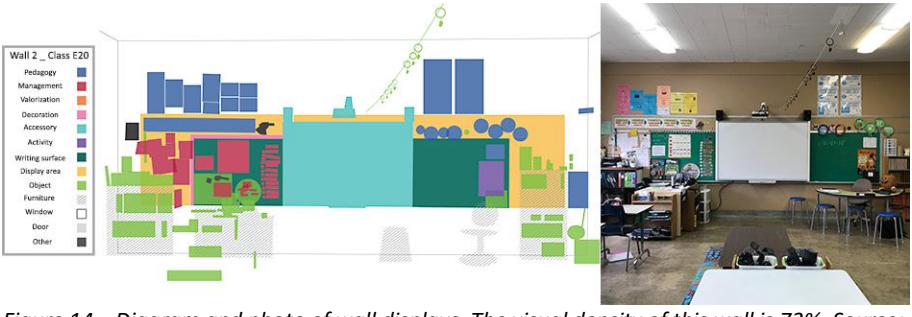

Figure 14. Diagram and photo of wall displays. The visual density of this wall is 73%. Source: Schola. Université Laval. 2019 ©

4.4 Disappearance of assigned places for pupils

It seems that classrooms in Quebec schools are changing to make more room for collaboration and greater individual choices for both pupils and teachers: in rows with individual desks (13.6%), in rows of two to four desks (27.9%), in blocks of three or four (9.5%), in blocks of varying sizes (18.4%), in groups (15%), other (15.5%). Nevertheless, the mobility of the pupils in classrooms induced by a greater flexibility of space reveals a trend that means the disappearance of the assigned desk for the pupils. In other words, the pupils tend to lose their seat, and must learn to find a place according to the rules of the teacher's classroom management and the change in pedagogical activities.

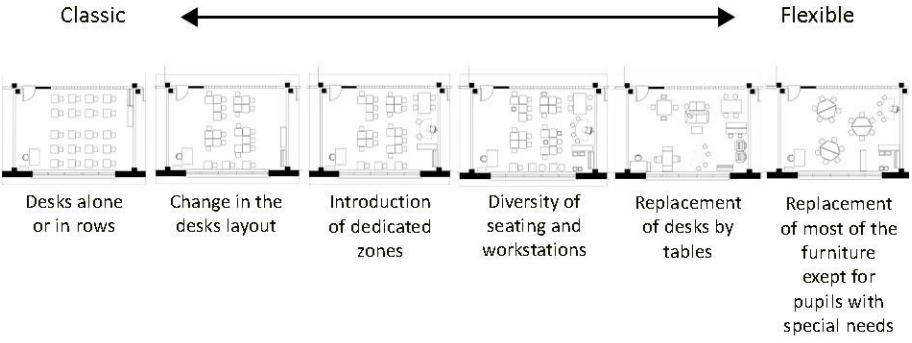

Figure 15. Spectrum diagram of classroom layout and the disappearance of assigned place. Source: Schola. Université Laval. 2019 ©

Although this observation emerged from the analysis of the observations and the inventory data, this concern did not emerge much from the interviews with the teachers, who seem to value their autonomy with regard to classroom design. However, the codesign workshop and interviews with pupils shows that they would like more privacy (Coulombe-Morency, 2019).

Figure 16. Examples of chairs designed by pupils with additions to allow more privacy for their chair. Codesign activity. Source: Schola. Université Laval. 2019 ©

Table 3. Issues of greater flexibility in classroom design.

CLASSIC LAYOUT	FLEXIBLE LAYOUT
FOR PUPIL	
Assigned seat	Management of places by privilege
Appropriation	Issues of stigmatization of special needs pupils
FOR PEDAGOGICAL ACTIVITIES	
Individual activities, teaching lecture and evaluation	Collaborative and autonomous activities
	Issues of privacy and concentration
FOR MATERIAL RESSOURCE MANAGEMENT	
Ease of sharing spaces and uses	Difficulty in sharing spaces and uses

	Less reversible and more unusual design

5. Discussion

Weinstein & al. (2011) based on Steele (1973) report six functions of a classroom: 1) security and shelter 2) task instrumentality 3) social contact 4) symbolic identification 5) growth and 6) pleasure and comfort. They argue that the physical, psychological, pedagogical and educational dimensions of learning environments for teachers and pupils are interrelated and materialize in the form of diverse spatial organizations. The spaces observed try to support these dimensions with different degrees of success and can sometimes conflict.

While these functions are part of different planning strategies that enable pupils to mobilize a set of learning activities, it must be recognized that the juxtaposition of all of their strategies without harmonization poses more challenges than one might think to the spatial and visual quality of the classroom.

We can wonder about the impacts of the pupil's place, the privacy (the security and shelter function, and symbolic identification), concentration and cognitive load, as well as the privilege management in spatial mobility inflicted on a daily basis (task instrumentality).

Our observations also raise an important concern about the stigmatization of the most vulnerable pupils, because only children with special needs kept their desk in a flexible environment.

If flexibility is introduced in a classroom, it generally implies a more unique and idiosyncratic arrangement that also induces significant challenges on a larger scale. These arrangements are in fact not easily reversible and make it more difficult to share space, furniture and equipment on a school material resource management point of view. From that perspective, it should be important to consider year to year demographic variations that modulate the opening, twinning or closing of classrooms.

Finally, the addition of furniture to the classroom is currently based on a relatively limited supply source. In fact, two manufacturers across the province are ostensibly taking over the entire market for school furniture. To seek to diversify their facilities, teachers and school organizations must therefore turn to foreign manufacturers or equip themselves with non-institutional distributors such as IKEA, Walmart or Amazon, thus making inventories of school amenities very heterogeneous.

In this context, our team puts forward the idea that it would be necessary to introduce a greater concern for harmonization as social justice principle into classroom design. Design recommendations should be linked with the relationship of the classroom to pupil wellbeing and school material resource management overall.

How then, can we ensure that we design furniture that offers a certain degree of uniformity throughout the school material resource management, so that all pupils can benefit from the best facilities even if the pedagogical approaches are different?

How can we promote a form of unity in diversity that avoids individual discrimination of children and support the work of the teachers?

6. Design for Social Justice in Mind: A Need for Harmonization

Some will wonder why the team is addressing the school furniture design problem by taking a kind of universalist design stance. The designer's responsibilities in a public context lead one to think about how to preserve equal opportunities and therefore to consider solutions that involve considering pupils who all have the same rights. In this sense, the effort of differentiation, which is strongly associated with one of the economic values in design, therefore deserves to be questioned, because it is strongly anchored in a market approach where design serves to sell rather than to serve social justice. In this respect, several design authors are beginning to highlight the links between design and inequalities, suggesting that such concerns should be addressed within the larger spectrum of social justice (Julier & Kimbell, 2019; Williams, 2018; Fisher & Gamman, 2019). Others call for reflection on design considerations in the context of public good where access to an equivalent service is needed no matter who delivers it (Gagnon & Watkins, 2017; Kimbell & Julier, 2019; Srinivas & Staszowski, 2019). Being caught between an industry that functions within a market framework and the government that works for the public good is a difficult position for designers. Finally, however contradictory the notion may seem, it may also be possible to orient the design of school furniture by allowing for stylistic and functional adaptations within a furniture system that can support several forms of teaching and classroom organization, while maintaining general criteria, such as a public purpose to be addressed and integrated into design propositions.

In this way, uniformization could be seen as a systemic design strategy for management, that addresses inevitable cost concerns, and in some aspect, equity between all pupils and teachers all across Québec.

Differentiation, on the other hand, should be seen an adaptive strategy to meet the needs of different types of learning and pedagogies, as well as distinctive identities of schools that can translate into stylistic changes or functional adjustments to the whole system. This strategy could be an easy way for the industry to appropriately service scholastic objectives. However, it should be initially important to consider an inclusive perspective as a prior design principle to avoid discrimination and eliminate segregation as much as possible, and finally to promote an equal delivery of public services to all pupils.

An effort at harmonization is certainly desirable at the classroom level, especially since some educational positions question the need for excessive differentiation from a pedagogical

point of view. According to certain studies, the notion that pedagogy must be differentiated to meet needs is not unanimously accepted: good pupils succeed almost within any pedagogical framework, because they already benefit from superior resources, those displaying more difficulty generally succeed with more explicit instruction. Explicit teaching, according to these studies, would therefore be beneficial to all (Gauthier & al., 2013; Gauthier & al., 2005). These perspectives on pedagogy are subject to debate, and the questions they raise can hardly be exhaustively detailed here. Nevertheless, bearing in mind these data, we should perhaps be concerned to promote, in all facilities, design that promotes explicit learning while allowing for adaptations.

It is therefore from this perspective that the team proposes to frame the design of the furniture by prioritizing design principles that allow a spatial organization permeable to the spectrum of flexibility observed while always allowing for classroom reorganizations, in such a way as to structure pedagogy in an explicit and more classical manner.

Finally, although the study focused mainly on space and layout, many parameters must yet be considered in order to harmonize school environments. In this regard, the analysis of colours, materials, technical considerations and environmental concerns should be addressed in further researches.

Abstract | This paper forms part of a three-year on-going research project which critically examines how design thinking is integrated into the development of city-based retail models. Through the selected three Chinese hybrid retail primary case studies, by considering the higher level of human needs and social contexts, brands could develop a sustainable core value, and it will enable brands to continue to innovate. Compared to traditional product-focused strategies and brand storytelling strategies, this research identified a full-spectrum interaction strategy which leverages the brand core values and social interactions. It allows brands to plan city-based retailing activities with careful consideration of full-range of human needs from physical, emotional, personal and social needs. Followed by the author's previous research, this paper examines design thinking methodologies into a brand analysis tool which allows key business decision-makers to plan the direction of a brand's strategic development.

KEYWORDS | DESIGN & BUSINESS INNOVATION, DESIGN THINKING, NEW RETAIL MODELS, EXPERIENCE DESIGN, CHINA RETAILING

1. Introduction

Traditionally, consumers regard the in-store environment of retailers as space which layout product or hanging on promotion materials to present "what they sell". From 2003, Apple store's provocative 'experience store' model dramatically transformed the way that a company should utilise the physical interaction with customers. The natural advantage that physical stores can compete with virtual retail environments is that they can create "full-sense" experiences (Norman, 2005) which can stimulate consumer's more in-depth responses and compelling brand associations. As one of the essential components of instore atmosphere, internal environments are attached with in-depth knowledge of the product and brand, contributing largely to consumer satisfaction (Mohan, Sivakumaran, & Sharma, 2012). The connection that a physical retail environment can create goes far beyond consumer satisfaction. Furthermore, real-life interactions dominate overall human wellbeing. Specifically, the interactions among human-human, human-social, and even human-culture that are carefully created by city-based retailers are not only can achieve the full-level of consumer satisfaction on consumption but also to the overall quality of everyday life.

The commercial decline of the city centre has forced businesses to reappraise retail trade activities; its planning seems behind the new economic era of demand (Léo & Philippe, 2002). Crawford argues in his paper 'A Brief History of Urban Form' "…*Cities have been consistently arranged around a centre hosting commercial and social activities*…" (2005). City high streets as 'systems' are directly associated with the life and death of the more extensive system of the so-called city (Dennis, Marsland, & Cockett, 2002; Hallsworth, 1995; Williams, 1996). Moreover, in competition between cities of creating their 'brands' (Coca-Stefaniak & Bagaeen, 2013), city high streets development links with secure investment and to attract and retain businesses which determines the economic success of a city (Hodgkinson, 2011). From a city planners' perspective, cities offer cultural, entertainment, healthy, social and more possibilities (Department of Communities and Local Government, 2013; Zhang, Zhu, & Ye, 2016). These should all be considered in the transition of city high street to shape future smart cities (Crawford, 2005; Fletcher, Greenhill, Griffiths, Holmes, & McLean, 2016). Regarding the specific debate about the function and the role that a store places in the city and community activities, Mary Portas, in her acclaimed review (Portas, 2011) offered a comprehensive summary. She argued, "*high streets are not just in commercial terms, but as dynamic, exciting and social places that give a sense of belonging and trust to a community, providing an important catalyst for both the investigation of and policy debate on, topics*."

How to involve social contexts into city-based retailing's sustainable business model innovation through design thinking is the key aim of this discussion. This paper questions the traditional way of product foci and brand story foci strategy and provides a full-spectrum interaction strategy could allow brands to meet the full level of latent customer needs.

2. The Evolution of City-based Retailing

2.1 Physical and social interactions

The role of a store environment and elements that can foster or sustain pleasant emotional reactions becomes strategically more important (Sherman, Mathur, & Smith, 1997). Nearly 40 years after Kotler (Kotler, 1973) noted the importance of the retail atmosphere for purchase decisions, marketing literature has affirmed the importance of a range of environmental and atmospheric variables. From the customer relationship point of view, as discussed earlier, if a brand wants to achieve full-sense of consumer experience (Norman, 2005), physical attachments are needed. The experience commonly associated with emotions. The way that our emotions' colour is strongly tied to environmental representations (Garling & Golledge, 1993; Golledge & Stimson, 1997). Furthermore, aesthetic preference represents part of the brand identity, which will automatically attract targeted audiences. Therefore, the data generated from the brand and consumer interactions in the physical space is way accurate than general online reviews. Secondly, research about retail business completed by Bell (Bell, 2014) shows that to understand consumer's activities in different types of locations (regions in the city and types of cities) will also support online business model evolution. In the same kind or regions or similar size of cities, consumers tend to behave with similar consumption patterns and preferences. This information is highly invaluable for a brand, which aims to expand the market or develop new product lines for both online and offline activities. This influence is pervasive, and sometimes counterintuitive, with implications for our lives in both worlds (both virtual and physical).

2.2 The changing status of retail strategy

Reviewing the relationship between online and offline retailing in the past decade, it has undergone three distinct phases. The first phase was Online VS Offline. It features the freshness of cross merchandise and the exaggerated convenience of online retailing. With lower start-up costs, less capital investment, and selling channels straight afforded physical retailers a heavy blow (Shackleton, 2016). While an online store can be quicker and simpler to set up than a retail business, though in terms of the allocated target market and building meaningful interactions with consumers, it is still far from satisfactory than physical retail spaces. To overcome this, the second phase was to move to Online to Offline (O2O). It is a business strategy that "draws potential customer from online channels to physical stores". The typical example of widely apply O2O is China (Pasquier, 2015), with the wide use of QR codes in local shops to make easy mobile payment and promotion coupons, branded and independent city shops achieved balanced benefits from the value of the internet.

As discussed earlier, customer journeys are increasingly complex due to multicomponent channels, online companies' disadvantages and limits were slowly magnified. Without 'touch-and-feel', brands will not be able to fulfil the full sense of shopping experience for

customers (Haims, 2017). Therefore, the third phase Online mixes Offline channels. In-store IoT (internet of things) technology and big data gives offline channels more opportunities to digitalise consumer behaviours and discover emergent business models. Overall, the image of bricks-and-mortar retailers in this research study is involved with technological tools and Omni-channel interactions; therefore, innovative business models and strategies are in urgent need of reappraisal.

Peter Drucker's definition in business model in 1994 (Jensen, 2013) was "assumptions about what a company gets paid for." Joan Magretta refined Drucker's definition and divided the meaning of business model into two parts. Part one associated with internal value proposition and capacity; part two is related to the external social and environmental context changes (Ovans, 2015). Especially to build a successful business in the Omni-channel retail era, establishing the core value proposition concerning the understanding of external context is the key to success.

2.3 Chinese 'New' Retailing: the new equilibrium

China is currently in the process of profound economic development, urbanisation acceleration and retailing evolution. The rapidly growing mobile internet market, emergent financial transaction technologies and new demographic segments afford Chinese city-based retailers both challenges and opportunities to develop new business models in achieving Omni-channel retailing and long-term survival (China International Digital Business Centre, 2017). With the support of the '13th Five-Year Plan' (2016-2020) for National Economic and Social Development, significant progress was made in transforming and upgrading the retail industry. City-based retailers are witnessing signs of recovery. China is widely recognised as one of the most competitive markets for city-based retailers. Rapid business evolution is now demanding retail enterprises to react proactively to develop innovative business models to remain competitive (Ho, Poh, Zhou, & Zisper, 2019). Traditional singular product or service-focused design strategies are no longer sufficient for city-based physical retailers to attract and retain existing consumers in the pursuit of sustained commercial success. As such, the authors are witnessing the emergence of a growing number of Chinese retail entrepreneurs leveraging the power of design and design thinking in the development of new hybrid retailing models. Through critical interrogation of the new retail landscape in China, this paper aims to discuss and reflect upon the evolution of retail design, proposing a hybrid retail model for the future development of sustainable city-based retail design activities.

3. Design Thinking for business innovation

Design has and is continuing to play an increasingly important role in delivering business value propositions, often in a variety of subtle ways. Firstly, the proposition contains elements that are highly tangible to the consumers, which are manifest in both tangible and

intangible forms. These may include built physical environments, digital applications, graphics and a wide array of supporting promotional material, physical devices and complementary packaging elements. The intangible proposition is equally as powerful but requires far more consideration in both development and delivery due to its subtle nature; these could be achieved through the offering of memorable services, clearly defined policies and processes that are so heavily informed by and through design. Taken in entirety, the holistic application of design addresses all attributes of a product or service offering it physically or virtually or both; what is essential though, this activity has to be intelligently and carefully orchestrated at both strategic and operational levels of implementation. In essence, it could be argued that design and design thinking is the manifestation of strategic intent making the intangible values of the organisation visible to a wide variety of both internal and external audiences (Turner, 2016).

It is very hard to have a singular definition of design thinking. Looking back to the evolution of design thinking, the first strand sees design thinking as a cognitive style (Cross, 2001); the second strand defines design thinking as a general theory of design which refer as 'human action in the realm of the artificial'; and the third sees design thinking as a resource for organisations (Kimbell, 2011, 2012). Tim Brown and Roger Martin, as a way to balance organisational tensions between exploration and exploitation (Abbing, 2010; Martin, 2009) or as a loosely-structured organisational process that stimulates innovation (Brown, 2009), design thinking that is gaining legitimacy among designers, organisations, and government bodies. Regarding the focus of this research within business contexts, theories from Martin and Brown toward business practice will be taking primary consideration.

It is commonly agreed (Cooper & Press, 1995; Hands, 2017; Turner, 2016) that the role, remit and responsibility of design and its overall management have considerably changed from an early stage to maturity and wider acceptance. As such, it is now considered a vital source of competitive advantage. Design thinking is increasingly gaining more attention within the organisation and that it is becoming increasingly strategic in its role as a mechanism to envision new futures for the company. Business leaders and key decision-makers drawn from traditional non-design backgrounds are exploring the numerous opportunities and challenges of this unlikely relationship with design. Brown (2008) argues that design thinking is "…*a discipline that uses the designer's sensibility and methods to match people's needs with what is technically feasible and what business strategy can convert into customer value and market opportunities*".

Furthermore, Liedtka (2010) actively encourages organisations to engage more proactively with design arguing "…*business strategy desperately needs design*..." With this flourishing symbiotic and mutually rewarding relationship in the ascendency, designers are now extolling the benefits of design to new and traditionally highly sceptical audiences, thus developing a 'design consciousness' within the organisation and establishing design as a core competence. In conjunction with this growing recognition from and by business leaders, design and designers are increasingly well placed to initiate, develop and support business

model development, NPD (New Product Development) opportunities and wider innovation activities. A core competence has to provide a significant contribution to customer-perceived value, and indeed design has played a leading and direct role in the 'value' offerings from organisations.

4. Research Methodology

The primary research approach taken by this research study, adopted a strongly qualitative methodology to gain an in-depth analysis of the city-based retail business model innovation. The study started with a comprehensive literature review of scholarly articles focusing upon contemporary retail evolution, design thinking, and business model innovation. The developing theoretical framework is shaped and adapted to gain a detailed understanding of city retailing dynamics, social interactions and the role of design in business model development to understand the symbiotic relationship between retailers, design and the local social context in which the retailer sits.

In addition, primary research methods and tools were drawn from established social science methodologies to obtain initial insights and observations from early findings. The author conducted an initial in-depth primary research in Tier 1 and 2 Chinese cities from 2017 to 2019. Early research activities involved visiting and observing numerous city retail outlets within a real-life context to gain an initial understanding of retail dynamics and consumer behaviour patterns. In-depth interviews with retail entrepreneurs, retail professionals and interior designers helped gain a deeper understanding of city retail model evolution and future retailing developments.

A radar chart has been designed for this research which upgraded from the author's previous developed design value framework inspired by Maslow's Hierarchy of Needs (Maslow, 1943, 1998). It enabled the author to identify and illustrate the relationship between core product (and services), design, brand value propositions, and social context engagement.

In order to reflect and incorporate representativeness of Chinese retail cases, the decision also took into account data from Combined China mainstream online consumer reviews such as brands' WeChat official account and Baidu, reports from international newsagents such as Tencent and Weibo. Three cases from field research were selected, WENHEYOU (catering and cultural brand), HUANYUE Art Space (art and aesthetic education institution), and 1200bookshop (24h bookshop). All three cases have its core value, albeit with different 'experiences' designed to represent their unique brand core value and to connect consumers through multiple dimensions. The hybrid functions well-orchestrated and crafted around the essence of their brand values directed towards their local communities and targeted user groups.

5. Case Studies

5.1 WENHEYOU

Brand core value: inheritance and disseminate Changsha city Culture.

WENHEYOU is a catering company, and cultural brand which located in the city in middle south China called Changsha. The founder started his business by selling local snack nine years ago and now became a cultural-driven brand and Changsha city landmark (WENHEYOU, 2018). Compare to traditional catering development model, WENHEYOU not only expanded in size and scale in the food-related category but most importantly, build a strong link with local culture and art. Different than most of the retailers try to design a high-end and modern style to fit with young group's aesthetic values, the brand takes nostalgia as their design strategy to build a warmth and closeness atmosphere with the unique local culture. Eat and visit at brand stores; customers can feel the core spirit of Changsha city, which is welcoming and enjoying life. In 2017, the company opened an art museum in the famous tourist place Changsha ancient Taiping Street to display the works related to the development of Changsha City and its local culture. Not long after, the brand opened a Stinky Tofu Museum in the same street to show tourists the history and making process of this unique local food.

In 2018, the brand presented its iconic architecture WENHEYOU Laochangsha Lobster Restaurant. It is a place located in a shopping centre with seven-floor high; the internal design replicated a typical Chinese community in the 1980s with various life scenes, such as barbershops, people's living room, and video game room etc. (WENHEYOU, 2019). In 2019, they upgraded the space and invited many local SMEs to join the space together became 'Super WENHEYOU Community'. It is a special place that could bring older generations memories of past times and refill the curiosity of young generations of the old city view. This project won reddot design award 'Best of the Best' 2019. The development of the brand is closely integrated with the local culture and the city's characteristics, the brand has become a window and representation of Changsha city image.

Figure 1. themes involved in WENHEYOU hybrid model. Pictures of 'Super WENHEYOU community' and brand logo.

5.2 HUANYUE Art Space

Brand core value: allowing everyone to become an artist of life.

HUANYUE Art Space is located in a place surround by living community and schools in Guangzhou city, China. Space's division is relatively simple. The first floor is a combination of a bookstore and a coffee bar; the second floor is an open workshop space for handicraft and art teaching. The brand argues that the demand for art and aesthetic education should not be limited by age and occupation. They wish to create links through art education and activities to allow people in communities embracing art and joyful life. Therefore, they designed three categories of brand' offerings (HUANYUE Art Space, 2019). Firstly, provide art and handicraft experience services for the surrounding residents such as children, older adults and housewives in store. These are the groups that are commonly ignored but could benefit from art activities.

Secondly, beyond the in-store space, the brand builds cooperation with various types of institutions to promote aesthetic education (HUANYUE Art Space, 2019). For example, the team visited regional libraries, middle schools, and kindergartens carried out art classes; organise pupils to explore their living regions. Thirdly, the brand also launches social welfare services and provide art activities to support NGOs and Red cross. For example, they designed art classes suit for the Deaf-Mute group, organised book sharing and donation activities. Leading by the brand core value, community bonding and social responsibility is

naturally integrated into their business model and brings the brand broader possibilities for future development.

Figure 2. themes involved in HUANYUE Art Space hybrid model. Pictures of HUANYUE Art Space store and art class for children.

5.3 1200bookshop

Brand core value: to light a city's deep night.

1200bookshop was a start-up project after the founder travelled returned from a 1200-km round-trip in Taiwan. It is located in Guangzhou city. This 24-hour independent bookstore's characteristics are closely related to the founder's own experience and value (1200bookshop, 2016a). First of all, the founder thinks the bookstore is not only about books, but it is also about space and human spirit. For numerous reasons, there are many people still awake after midnight. Some people cannot sleep, some people nowhere to go, and some travellers waiting for their train. Therefore, the brand aims to give these people a safe and warm place to spend the night. Second, backpacker experience allows the founder understood that some travellers might not be able to pay for the hotel. Other people nicely provided a sofa for him in the past made he wants to return the kindness to society. Thus, each bookstore always has a room for people in need to stay temporarily.

Third, from years of store operation, he noticed that many people come to the bookstore reading books with a long-term study aim. One of customer explained that his daily routine occupied with work and take care of family, he wishes to have a study room for reading and personal reflection. He sees the bookstore as his unique study room and a break to find inner peace (1200bookshop, 2016b). Hence, the design of space reserved a lot of quiet seats.

Fourth, after a young man shared his story of 82 days walks to the city, a Late-night Story Sharing event has been continually held over a hundred times. Added to that, every day, store staff pick up a short in-store customer story with a paragraph post in the bookstore's WeChat news account. More than 700 stories about ordinary people have been recorded and shared. Last but not least, deaf-mute people are welcomed to work in here, even though the bookstore is not a social enterprise, but incorporating public welfare into its brand strategy has brought them uniqueness and competitive advantages.

Figure 3. themes involved in 1200bookshop hybrid model. Pictures of a quiet space (during the night can transform to a bedroom for backpackers) in 1200bookshop and Late-night Story Sharing event.

6. Discussion

From the author's previously published research findings (see Figure 4) (Huang & Hands, 2018), it approves design could drive business innovation through different levels of human needs which based on Maslow's Hierarchy (Maslow, 1943).

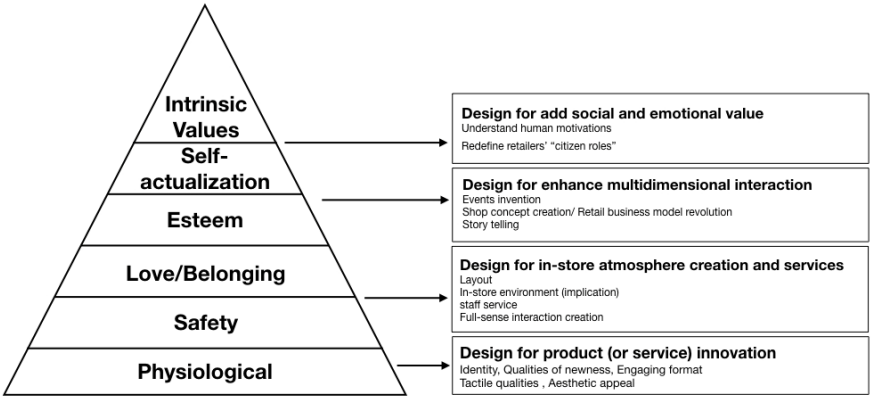

Figure 4. author developed design drive retail innovation categories fit with Maslow's Hierarchy from previously published research.

Based on the many scholarly' articles and primary case studies of selected Chinese retail brands, this paper enhanced that by strategically planning design, including but not limited to product design, service design, in-store atmosphere design, and business model design. Retailers can achieve what business management aimed to meet consumers' emotional and social needs; what marketing talked about to identify unique selling points; and what city planning emphasised to build stronger connected local communities. With innovative design thinking, city-centre based retailers can shift their focus on selling-and-buying competition with e-retailers to explore more possibilities by redefining "citizen roles". Design can build different channels to allow brick-and-mortar stores and consumers to communicate with each other. During its process, the business model was moulded and adapted to fit new contexts of consumers' city life. The reconfigured business landscape is on its way being rediscovered, and design will keep the equilibrium between the old and the new.

Similar viewpoint from a business development perspective, the Economic Pyramid which presented in the book 'The Experience Economy' highlights that companies can experience transformation from making goods, deliver services, stage experiences, ultimately, to guide transformations (Pine & Gilmore, 2011). 'If you charge for the demonstrated outcome the customer achieves, then and only then are you in the transformations business.' which rise the necessity of business shift their way of thinking and planning business.

The research used Maslow's Hierarchy (Maslow, 1943, 1998) as a foundation to analyse the route of business development. Order and hierarchy do not affect business strategy; the design of business strategies is more likely to consider cross hierarchy. Six categories can be seen individually and combine freely to present a brand's target and focus. Figure 6 showed categories placed with different positions in each brand that emphasises with distinctive percentage. The multiple services and products which the brand added over the years have

always encircled or enhanced the core value (see Figure 5). The weakness of categorising retail types and vertical business development thinking is it could limit the brand's possibility of developing higher offering and narrow the scope of ways to approach to innovation.

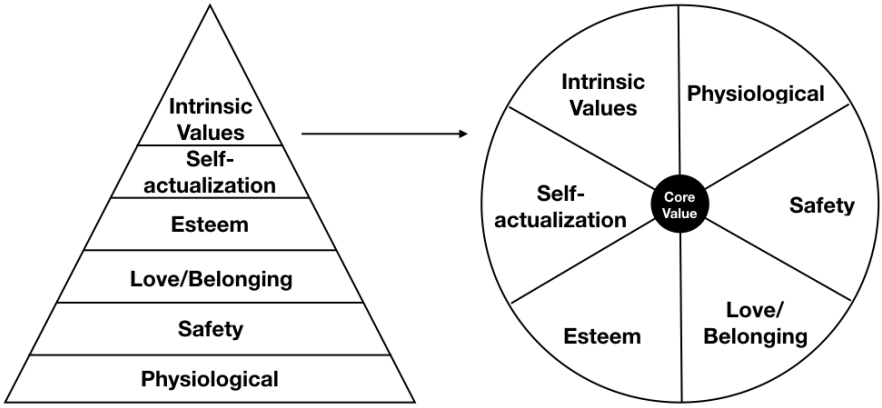

Figure 5. eliminate the hierarchy, transform the human needs into a design thinking tool for business opportunity innovation.

The Chinese-context-based case studies in this research paper provide a new perspective and development of the framework for business planning. It is evident that all three brands' offerings were mixed between different needs with clear emphasises (see Figure 6). 'Super WENHEYOU community' created an integrated experience which fulfilled customers' needs of eating local snacks and a sense of belonging with nostalgia. HUANYUE designed art activities for disabled group and communities that support both esteem and intrinsic values. 1200bookshop provide safety for backpackers and midnight sleepless people and create quiet space for people who wish to find inner fulfilments.

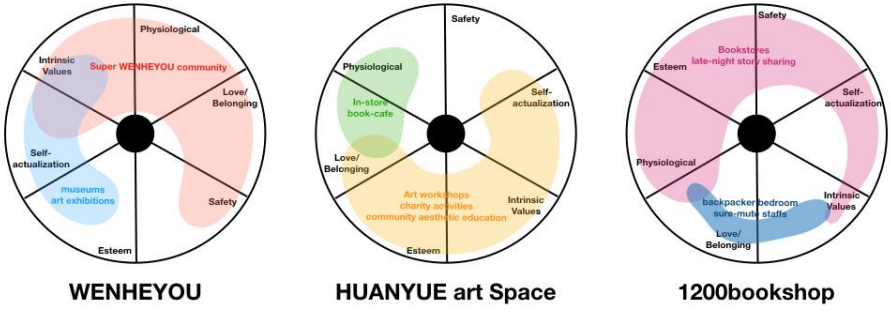

Figure 6. based on developed radar chart, they are clearly shown three brands' hybrid model covers different needs.

Furthermore, it is demonstrable that all three brands' core value is not about what they can sell, but closely related to social contexts and personal values, this could also offer insight of how to define a brand's core value and unique selling proposition.

7. Conclusions and further research opportunities

This discussion explored the realm of design thinking for business and in particular to business model innovation for city-based retailers. Through the selected three mix-category Chinese city-based retail brands cases; research demonstrated a hybrid retail model. Which allows the retail business strategy to evolve from a foci point (traditional advertising strategy) to storyline (brand storytelling strategy), and currently towards a full-spectrum Plane (brand core value and social context interactions). Furthermore, by illustrating the values of design as a subtle mechanism to explore new business opportunities and fulfil different levels of consumers' needs, this research contributes a 'radar chart' tool for retailers to discover and refine their retail design strategies. Therefore, to foster a long-term sustainable approach to their commercial business planning activities.

As this research study only extracts limited data from three years of design for business planning activities, initial findings may not be considered 'generalisable' to a broader sample of business contexts. However, the currently prototyped hybrid-model has been developed within an experimental scope for further refinement and subsequent testing. The authors acknowledge the current limitations of the model in its current developmental form. Further studies could focus on how to apply the developed design for business innovation tools into wider business contexts that allow them to use and adapt design thinking into their business innovation processes and planning activities.

About the Authors:

Yujia Huang is lecturer in Design Enterprise at DJCAD, University of Dundee. She has worked extensively in the creative industry as branding strategist and research director. Yujia's academic publications and research are focus on design thinking for business innovation and higher education; experience design; and user-centred design.

David Hands is Course Leader for MA Design Management and Associate Director of Teaching and Curricula at ImaginationLancaster, Lancaster University. He has written and published extensively on all aspects and themes embracing strategic design management theory and practice.

Rachal Cooper OBE is Distinguished Professor of Design Management and Policy at Lancaster University. She has published extensively and leading international research projects on themes of design thinking; design management; design policy; and a specific interest in design for wellbeing and socially responsible design.

Nick Dunn is Executive Director of ImaginationLancaster where he is also Professor of Urban Design. Nick has worked with the Alliance for Healthy Cities, European Commission, International Dark-Sky Association, World Health Organization, and sits on various scientific committees and advisory boards.

Feeling Endem. How travel enhances applied-autonomy in spatial design.

Hans Venhuizen

Royal Academy of Art The Hague
h.venhuizen@kabk.nl

Abstract | Spatial design is a complex matter by nature. At various scales from cities to interiors, there is always a context with many preconditions that the designer has to take into account. In developing the ability to deal with the specific context from their own perspective, to act with an autonomous mind in an applied context, it plays a key role where designers themselves are situated. TRAVEL is an educational programme that enables future spatial designers, by means of travel, to discover their own preconceptions, to critically examine them, and to get to know their own position from the way they perceive their environment. Subsequently, the programme also enables them to use their own observations as personal special features in their designs. Through encounters, explorations and experiments in four successive phases, TRAVEL gives future designers curiosity, confidence and skills in gathering and interpreting information and developing personal design strategies from that.

KEYWORDS | SPATIAL DESIGN, TRAVELING, APPLIED-AUTONOMY, BUILT ENVIRONMENT, EXPLORATION

1. Introduction

Spatial design is a complex matter by nature. After all, at various scales from cities to interiors, there is always a context with many preconditions that the designer has to take into account. Ideally, the design of space is neither dominated by the preconditions of others nor by the autonomous perspective of a designer. Spatial design is *applied autonomy*. The virtuosity of the designer lies in the way how she/he manages to deal with these preconditions and how she/he sorts, interprets, places in a hierarchy and depicts preconditions. In developing the ability to deal with the specific context from their own perspective, to act with an autonomous mind in an applied context, it plays a key role where designers themselves are situated. Their backgrounds and opinions that emerge from that, the preconceptions that came out of it, determine to a large extent how they themselves see the world and act as a designer in that world accordingly.

TRAVEL is an educational programme that enables future spatial designers, by means of travel, to discover their own preconceptions, to critically examine them, and to get to know their own position from the way they perceive their environment. Subsequently, the programme also enables them to use their own observations as personal special features in their designs. The programme has four successive phases and starts with *ENDEM*, the albanian concept of *being happily lost*.

2. Traveling to observe trivialities

2.1 Search images enable navigation

In her book *On Looking, Eleven Walks with Expert Eyes*, New York psychologist Alexandra Horowitz observes her urban environment 11 times through the eyes of others. (Horowitz, 2013) Through her walks with a field biologist, an urban sociologist, a geologist, a typographer, a doctor, but also with a dog and her two-year-old son, she learns to see her urban environment from completely different perspectives than hers. Her fellow walkers all turn their eyes to other things; from a thirty thousand year old stone, a traffic light, a soup kitchen or a façade lettering, they all make their own connections and recognize their own systems. With the description of the walks, Horowitz shows our world as a *pluriverse*, an endless collection of small 'own' worlds. The various experts taught her to look at the city in a different way, adding various universes to her own universe. They gave her a bit of their expertise which now allows her to identify the genesis of some old stones, to catch aphid colonies in certain situations and to recognise the origin of some façade lettering. Horowitz shows that knowledge of a place is determined by the gaze of the person observing and the moment of observation. Horowitz calls the specific frameworks with which a person perceives the world around her or him and which in turn arise from her or his expertise of someone, *search images*.(Horowitz, 2013, p.124) Everyone needs a mechanism to choose from everything the world has to offer, those things she or he has to look for, or look at, and

what to ignore. "Thanks to the *search image* in your head, you're able to recognize a friend in the middle of the crowd getting off the train at Grand Central," says Horowitz. "It's the visual form of expectation that allows you to sense meaning in the chaos." The human brain also has to sort out information from the environment, because it is not able, it does not have the capacity, to give equal attention to all visual perceptions in the environment, including sound and smell.

2.2 Perception is determined by situatedness

Search images guide us through the jungle of the built environment. They filter out irrelevant observations so that our brain capacity does not have to succumb to the constant flow of information from our environment. A downside of this survival mechanism of the *search images* is that once they are successfully installed and the user can navigate reliably through the city, they do not quickly replenish or change. Your head does with impulses from the urban environment the same thing that Google does with your searches. Like Google, which interprets your preferences using an algorithm, your head thinks it knows what is relevant to you. Then your brain makes sure as much as possible that you only perceive the information that comes through that filter. The extraordinarily useful tools that our brain has developed to enable us to deal with complex spatial situations immediately ensure that our perceptions are filtered and therefore impoverished.

By filtering for relevant information, the ability to allow the impulses that are out there is limited. This makes our image of the world much more superficial and limited, we put it together especially for ourselves. Contrary to the *worldwideweb*, where the information assessed by the algorithm as irrelevant remains invisible to us, the information that our brains classify as irrelevant in the built environment and therefore do not allow us to perceive, remains visibly present in the built environment. We simply filter it out of our perception. We don't need a digital manual to conjure up this information, but an analogue instruction to see better what we don't perceive from automatism. The walks with experts provided Horowitz with such an instruction that gave her many new *search images*. The experiment made the urban environment more layered and richer for her and showed her how limited her view of her piece of city had been before. The knowledge gained from observations and the transfer of knowledge by experts never provides a reliable and universal 'complete' picture of the city. At the same time, it shows how endless the perspectives on the city are.

Horowitz book reveals that knowledge of a place is by definition determined by the moment of perception and the person who perceives it. Biologist, philosopher and feminist theorist Donna Haraway argues that objective knowledge by definition does not exist. (Haraway, 1988, Autumn). Knowledge is never objective and is always determined by the character of the observer. Knowledge can thus simply never be neutral, instead it is determined by the gender, race, cultural background, nationality, economic position and social status of the person formulating it. Haraway states that it is necessary to make the origin of the

knowledge clearly visible before you can assess its value. What is the background of the person who has gathered the knowledge and what are the points of view that this background has led to, how and where can you place the knowledge, i.e., where is it situated?

2.3 A catalogue of spatial awareness

Following Haraway's observation about the character of knowledge and the experiences of Horowitz, I argue that all observations are by definition situated: they are somewhere at some point in time and are made by someone, from a specific point of view. This concept of situatedness implies a relativization of the intended objectivity of spatial analysis, if at all. At the same time, however, it enhances the possibilities for personalisation for the world of spatial design. Spatial design is a creative process in which the designer applies his or her creative capacity to a spatial situation that is about to change. Spatial design is obviously not an autonomous process, but ideally it is neither entirely determined by the preconditions of others. Spatial design is *applied autonomy*. After all, there is always a context with spatial, social, legal, cultural, practical and financial preconditions that the designer has to take into account. The virtuosity of the designer, however, lies in the way how she/he manages to deal with these preconditions and how she/he sorts, interprets, places in a hierarchy and depicts preconditions. In order to do that successfully, spatial designers must first and foremost determine where they themselves are situated. Their backgrounds and opinions that emerge from that, determine to a large extent how they see the world.

How the future designers' perspective on the world is shaped by their backgrounds, is best discovered by constantly exploring the world that surrounds them. By travelling, and thus stepping outside their familiar situation, they confront themselves with other situations with which they are unfamiliar. This confrontation, followed by analysis and reflections, make these designers aware of how a specific space was created. According to the nineteenth century German architect Gottfried Semper, the creation of new spatial forms emerge by defintion out of the interaction between all the relevant *agents* or forces that dominate the spatial context. (Moravánszky, 2018, p.53) By travelling future designers can explore these *agents* and establish where these preconditions for the creation of the explored spaces differ from their own points of view. In this way they gain insight into the starting points, preferences, but also the automatisms and prejudices that determine their world view. TRAVEL enables designers to collect these insights in their own perspective and thus build up a catalogue of their own *search images*. This catalogue, this awareness of their own perspective on the world around them, is for spatial designers a crucial component of their own design position.

2.4 Collecting and interpreting evidence

Through TRAVEL future spatial designers practice observations as a tool to explore their *situatedness* and through that define their own design position. TRAVEL can start with an

extensive examination of the history and topicality of the context to be visited, but it can also start completely *knowledge-free*. The insights of the participants do not start from knowledge of a total overview, but are built up from the observations of fragments. In her conclusion, Horowitz describes this approach as follows:

> "In the nineteenth century, skilled anatomists insisted that they could recognize an animal and even reconstruct it on the basis of a single bone. But the 'animal that is the city' can be traced in the same way by means of small pieces of evidence. One aspect of perceiving all that is on a simple block of streets, is the realisation that everything that is visible has a history. At some point it ended up in the place where you found it, at some point it was put together, cut out or forged, and it has fulfilled a certain role or existed for a certain function... It is evidence." (Horowitz, 2013, conclusion)

By collecting and interpreting *evidence*, future designers build their personal catalogue with *search images.* They use this catalogue to be aware of their own perspective on the world around them and act as a designer in that world accordingly. TRAVEL does not aim to automate one's own actions so that they can avoid unwanted confrontations in the future. By observing and analysing their environment, designers are confronted with their own starting points and prejudices. They map out their own perspective and formulate their own design position in which confrontations do not have to be avoided, but rather can lead to brilliant particularisations. Horowitz ends her book with a quote from Sherlock Holmes: "You know my approach. It is based on the observation of trivialities". This observation of trivialities is the core of every enlightening TRAVEL.

3. The TRAVEL programme

3.1 Intuitive analysis of a spatial context

TRAVEL is a course that takes about 28 days spread over a period of 8 months. (Venhuizen, 2019) TRAVEL starts with ENDEM and ends with STOFFWECHSEL. ENDEM is the Albanian concept for *feeling happily lost* and invites participants to gather all sorts of impressions without actually knowing for what reason. In the next phase of TRAVEL, 好奇 or HÀOQÍ is the key emotion. HÀOQÍ, the Chinese word for *curious*, challenges participants to reflect on what they actually saw and to discover all kinds of fascinating observations that stimulate their curiosity. In the third phase participants limit their observations to the core idea framed in various PADIDEH, the Persian word for *phenomenon*. These PADIDEH will be confronted with designtasks through placing them on two sides of a matrix, thus creating a *field of change*. Finally participants explore the possibilities that are hidden within this field through combining seemingly irreconcilable elements, exploring the observations by merging them and thus applying these to their *metamorphism*, or STOFFWECHSEL as Semper framed this phenomenon in architecture.

The TRAVEL approach originated from my artistic practice, which is within the cultural dimension of the built environment. I develop proposals for spatial changes based on intuitive analysis of the context that is about to change. To this end, I developed a method that makes it possible for the results of that analysis to play a guiding role in the design of spatial proposals. With TRAVEL I made the method, which I implicitly applied in my own practice, also applicable to others. In practice it quickly became apparent that the participants needed much more than a mental introduction within a diverse programme of travel. Because of previous experiences participants had with excursions, which were generally more knowledge based and focused on specific visits of highlights, I determined that they needed clear instructions and a framework within which a broader intuitive spatial analysis could lead to results. This gave rise to the 4-stage approach introduced here, each phase with its own name and character. The identity of the phases, which is formed by the naming and the specific interpretation thereof, contributes to enticing the participants to question and immediately expand their palette of existing *search images*. With this, TRAVEL serves as the aforementioned analogue instruction needed to allow the exploration of the built environment to transcend the familiar perception.

3.2 TRAVEL: an exploration without preliminary research

The method of exploration I developed and applied shows great affinity with the way geographer JB Jackson approached the built environment. Jackson did not feel hindered by a lack of expertise in spatial planning, and relied entirely on his own observations and the knowledge that this gave him. He recognized the essential traces of man's survival strategies in the landscape and was able to test this knowledge with further literature study, expand it and place it within a broader framework of the culture of settlement. (Brinckerhoff Jackson, 1997, xxiv)

I argue that an exploration is best started without preliminary research. Each preparation provides guidance in answering the research question that has been opened up, thereby steering the observation in the direction of the data that has been mapped out in advance. An exploration that has been carefully prepared carries the risk that mainly the clues established in the preparation will subsequently be recognised and therefore the serendipitous clues will not be recognised. Scaling up your understanding of the context by determining meaningful details gives you the opportunity to see your own explanatory lines and structures instead of following those drawn up by others.

3.3 TRAVEL phase 1 - ENDEM

As you might expect, the TRAVEL consists first and foremost of a collection of travels. These travels can be short or long and far away or close to home, it doesn't matter. A number of principles are important when putting together and undergoing these travels. First of all: - *go there*. It sounds ridiculously superfluous but in practice it turns out not to be. Many designers find their inspiration and references from second-hand information. On the

internet and in magazines you can find beautiful photos and striking text descriptions of many inspiring places. It is tempting to believe and use them. That brings me to the second principle: - *only believe what you see for yourself*. This too sounds preposterous but turns out not to be either. The images of familiar places put in our heads by the internet and magazines are so strong that they can even survive a disappointing confrontation with reality. In the past, participants in TRAVEL sometimes appeared to be forgiving towards that disappointing reality and continued to cherish the second-hand image already present in their heads. But situations are - *as they are*. And also, or especially, from - *bad examples, there is a lot to learn*. Therefore, information about places only matters the moment you think it matters. When a participant notices something in an observed context, or feels a need for information, that information is quickly found by means of your smartphone. The last principle for ENDEM is: - *look in between*, that is to say, not only orientate on what you think is a highlight, but also study the front and back and everything in between. Travelling is a mental state and starts as soon as you leave your home and not only when you arrive at alleged highlights.

The design of the travels; the locations to be visited, the planned meetings, the modes of transport, the moments and places of stay, the *in-between*, etc, is a crucial part of the travel experience. The instruction participants receive is simple: photograph what you notice and load those photos onto your travel blog. However, the instruction turns out not to be as simple as it seems. Such openness frequently leads to uncertainty and also causes ingrained reactions. Participants generally start by taking *magazine photos* or *instagrammable images*. In addition, they sometimes try to see what they think I, as a course leader, want them to see. From the uncertainties came the name and design of this phase. Once, when I explained the intention to a group of international participants, who had been confused by the proposed openness, a participant from Albania came up with the word ENDEM, which in the Albanian language stands for travelling and being on the road, but above all has a meaning of *feeling happily lost*. In other words, a positive approach to the fact that you don't know what you're looking for. ENDEM turned out to have a a strong reassuring effect on the participants who were looking for a precise definition of the desired outcomes of the programme. Reassured that there was no such definition, they were free to observe and take photographs.

After about 15 days of travelling, I ask the participants to fill their blog with at least 100 photos. The selection they have to make is so broad that it can never contain only the beautiful architectural photos or the observations that were made strategically just to meet the conditions. I consciously ask the participants to take photos and not drawings because with the wide selection of photos comes much more information than the participant can direct. Moreover, although the photos are focused on a certain point, they generally contain a lot of additional information that could be lost with a focused drawing. As a result, participants take information with them that they didn't even know they had seen. This catch, and especially the bycatch, is an important topic of conversation during a first travel-talk that I conduct individually with the participants. Because of the uncertainty about the

course brings about, I prefer to have individual talks. In my experience individual talks can easier lead to understanding, trust and insight and tend to be less strategic than group talks. In these conversations participants are willing to see the prejudices with which they inevitably photograph, but they are also able to recognise other fascinations in their observations. New fascinations with which they become more aware of and can expand their catalogue of *search images*.

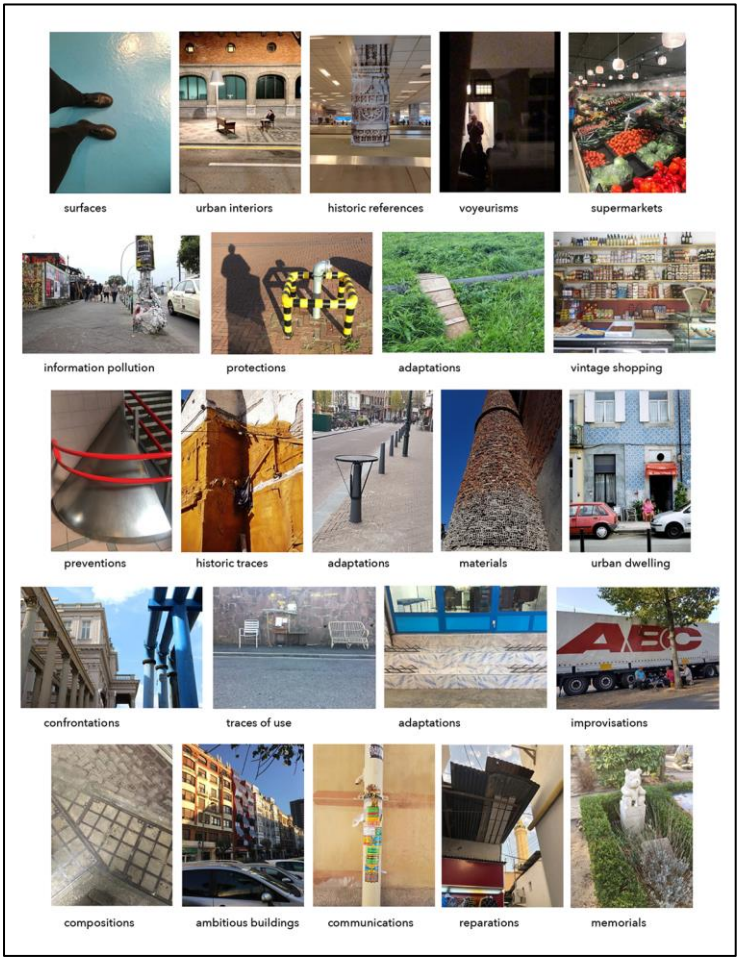

Figure 1. A small selection from the total collection of about 1500 photographs that resulted from the ENDEM phase of a TRAVEL course in 2018-2019 with 10 participants from 7 countries in Europe, Asia, and South America. These and also all other images in this text, are from participants Devina, Samantha, Shripal, Keyi, Mary, Sebastian and Ausra and were taken in Spain, Germany, the Netherlands, Portugal, India and Greece.

3.4 TRAVEL phase 2 - HÀOQÍ

The name of the second phase resulted from a long discussion with a Mandarin speaking participant. Our conversation kept going back and forth about the question of what to observe when there is no concrete design assignment. It may be a somewhat romantic idea, but I myself assume that spatial designers are always 'on', permanently searching their surroundings for interesting situations and their special histories. Not a paying client or an assignment but their curiosity is the most important client. With the Mandarin word for curious I convinced this participant of that. And the word remained connected to the second phase of the TRAVEL course.

好奇 or HÀOQÍ begins with an exploration of the self-composed travel blog. The instruction is simple: after traveling look back at what you have found. Try to distinguish what you think you saw, what you think you should have seen from what turned out that you actually saw. Let your intuition guide you through your documentation and see combinations, things that are fascinating, things you did not notice before, things that are out of the ordinary, or just especially common. I explore with them, allow myself to be carried away in the interpretations of the observations made by the participants, but also draw their attention to the wondrous situations that they may not immediately perceive. In doing so, I constantly ask the question: "what happened there, what is going on, how did it come about, what ambitions and strengths were at work there, whats your personal perspective on that?" I ask them to name the elements that could have caused the situations they observed, distinguish the decisions, ambitions, coincidences, accidents, designs, geographical contexts, cultural habits, political decisions, financial possibilities, social preferences, etc. etc. I let them speculatively fathom the origins of the observed situations and make sure they don't focus too much on the results they've observed. Participants go in search of this background information of the situations they find intriguing. They add this information as comments to their travel blogs.

As a fellow explorer, I pay special attention to the presence of prejudices and simple disqualifications in the descriptions that could be revealed by the use of words as • exiting • inspiring • amazing • disgusting • ugly • intense • impressive • surprising, etc. I encourage the participants that with these ratings, observation does not stop, but begins. Then the confrontation with one's own preconceptions begins and can be generated and supplemented with new *search images*.

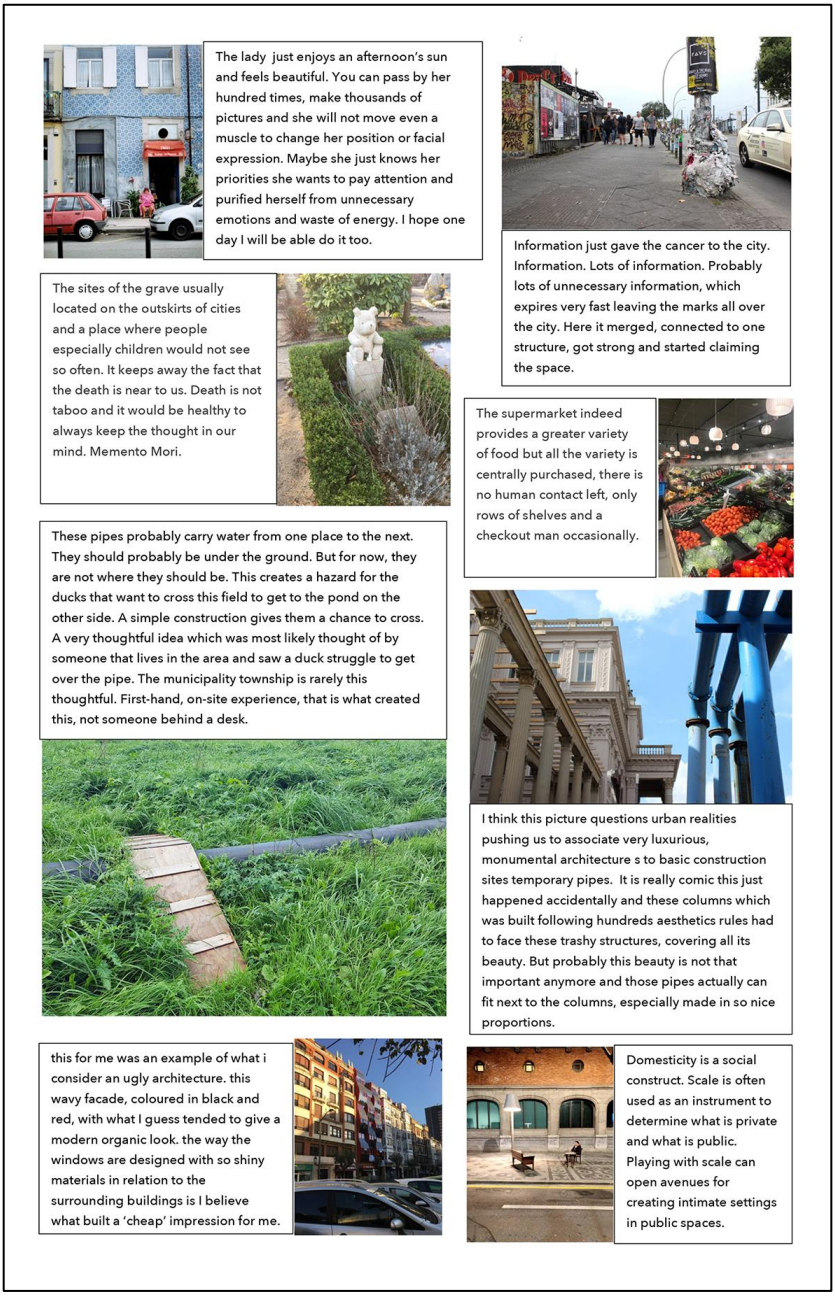

Figure 2. A selection of the previous selection with short reflections from participants added.

3.5 TRAVEL phase 3 - PADIDEH

Contrary to Brinckerhoff Jackson, the TRAVEL explorations do not aim at mapping out and interpreting the contexts that we visit as a final goal. Ultimately TRAVEL focusses on action and spatial design. What has emerged from phases 1 and 2 are speculative analyses of processes of spatial change based on personal interpretations of intuitively collected *evidence*. But understanding a spatial situation in your own way is not the same as being able to change it. To this end, the pieces of *evidence* gathered need to be transformed from 'passive' observations of situations, to 'active' instructions. In other words: in phase 3, we swap the perspective of *interested consumer of space* to that of *producer of spatial transformations*. When the 'activated' instructions are strategically positioned within a process of spatial transformation, they are able to add personal interpretations of the designers to the newly-built or refurbished built environment. They do this not by determining the form in which the future built environment should manifest itself, but by playing a guiding role as a determining precondition within a field of preconditions within which that future form arises.

This is how it works. From the large amount of pictures from the ENDEM phase, the participants in the HÀOQÍ phase have added their personal analyses to about 40 observed situations. The study continues with this selection of 40 observations. The participants identify similarities and striking differences. They combine the observations where possible to create groups. Subsequently, the observations are 'reformulated'; from the description of a situation a rule is drawn up that could cause similar qualities of the described situation in a different context. In the example of the almost sculptural accumulation of posters shown above, the participant chose to translate the form abstractly into 'visible layers of use'. The example of the staircase for ducks over the temporary drain in the field above was also dissociated from the context in which it was found. The participant has chosen to focus on the actual users of a space and to realise facilities that are explicitely recognisable for them. By separating the perception from the place in which it was found, by defining the core *phenomenon* behind the situation in a rule, this *phenomenon* can also become a quality for other situations. Although these rules are still based on the situations depicted, these examples are let go here. The examples fade away (literally applied here) and the words of the instruction, the *language of the rule* take over from here.

The name PADIDEH for this phase, like the previous names, comes from discussions with participants. Because the observations do not have an established appearance, they can consist of objects, space arrangement, but also colours, sounds, smells, soil conditions, climate, use of space or even laws or traditions, I called the rules distilled from these observations in the first place *phenomena*. In the Merriam-Webster online Dictionary, *phenomenon* is described as 'an observable fact or event', an open description for an observable event without the need to categorize it directly. *Phenomena* are a tool to frame a situation in a personal way and accompany a designer during the process from understanding to designing a spatial change. But it was precisely this openness that blocked

the participants who appeared to need a more detailed description of what they had to comply with. Because such a description would undeniably limit the openness, I adopted the word PADIDEH, the Farsi word for *phenomenon* that is also used as a maiden name, from a participant from Iran. The use of PADIDEH instead of *phenomenon* had the same effect as the word ENDEM, it invited participants to search for the rules behind their observations without wanting to know in advance exactly what the final outcome should be.

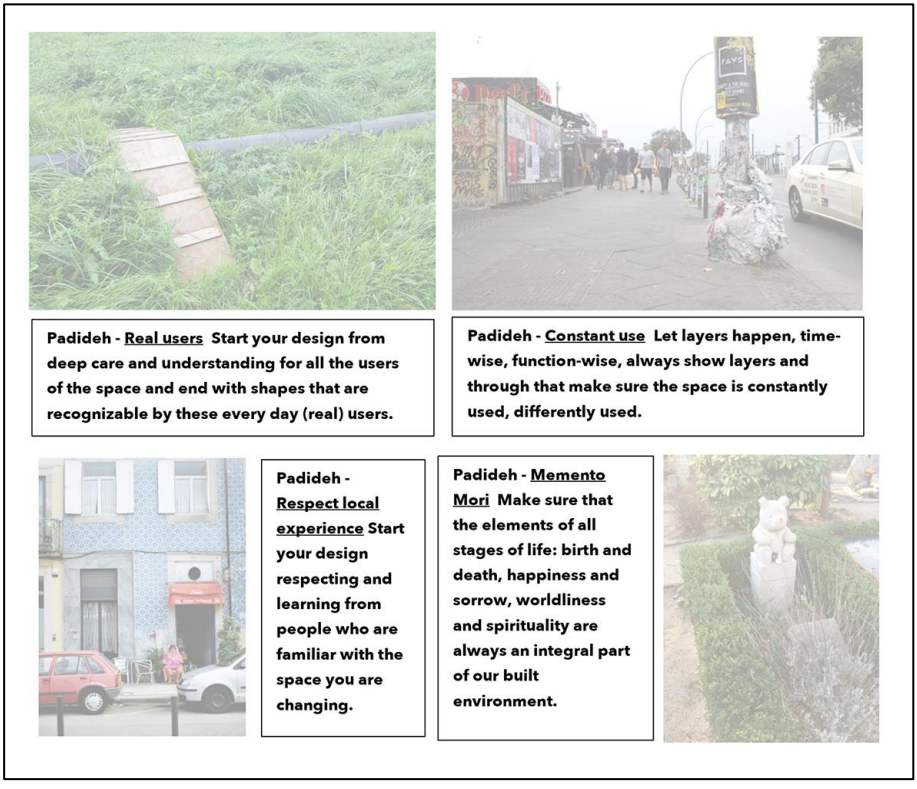

Figure 3. A selection of the previous selection turned into rules, to enable the observed phenomenon to become a quality for other situations. Examples fade away, words take over.

3.6 TRAVEL phase 4 - STOFFWECHSEL

From phase 3 at least 5 PADIDEH per participant arise which are applied to a design context in the fourth and final phase. I called this phase STOFFWECHSEL, a name that refers to the theories of the German architect Gottfried Semper. Semper adopted the concept of STOFFWECHSEL, or metabolism, from the natural sciences in the mid-nineteenth century to interpret his basic principles. (Moravánszky, 2018, p.163) STOFFWECHSEL is the collective name for all biochemical processes that take place in living organisms. It contains all processes in which raw materials from an environment are absorbed and converted in a body into substances relevant to that body. With the introduction of this term Semper stated his view that spatial design is a continuous reinterpretation of known forms in new contexts. According to Semper, cultural relevance arises in spatial design when a former dependence on materials no longer exists, but is 'thematized' by means of STOFFWECHSEL. This theming gives the objects the ability to remember and thus gives them a cultural significance that far exceeds their everyday usability. (Moravánszky, 2018, p.189) STOFFWECHSEL takes place within TRAVEL by confronting the collected PADIDEH in a matrix with design tasks that have no relationship to the locations in which the PADIDEH were found. With their application the PADIDEH function as deliberate limitations to the design. I argue that the most decisive for the form that the results of a spatial transformation process take are the limitations that the ambitions for that transformation have to deal with. It is precisely the limitations that give creative design processes an impulse. (Biskjaer&Halskov, 2014, p.57) In designing spatial changes, these limitations can be welcomed as *creative constraints*.

I apply a matrix because it enables a structured inventory of the components of an investigated situation and its form invites a thorough, systematic exploration of new possibilities. The application of a matrix is inspired by the theories of the *General Morphological Analysis* developed in 1967 by the Swiss astronomer Frits Zwicky. (Ritchie, 1998, revised 2013) Zwicky applied a three-dimensional matrix to systematically explore all confrontations between agents of a context in change. My matrix is much simpler than Zwicky's. My matrix is two-dimensional and contains on one side the formulated PADIDEH and on the other side (elements of) the design context. The fields between the entered parameters on the x and the y-axis are left empty. The matrix with its combinations of personal PADIDEH and design assignments that come together on its empty fields, is then the surface on which the possibilities for stacked transformations can be explored. In this way, the personal interpretations of the intuitively collected evidence, contained in language, are brought into relation to design assignments and explored in order to finally be materialized again, in a different form.

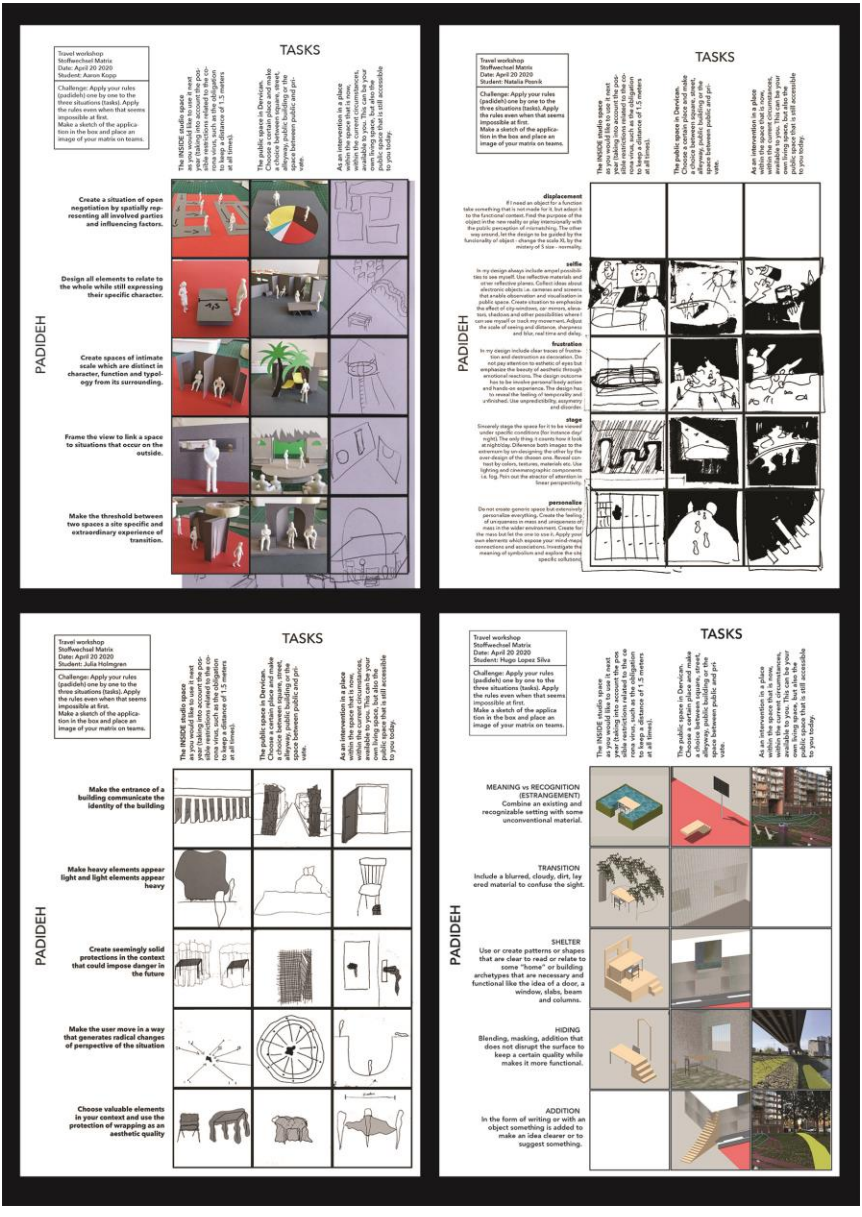

Figure 4. In the final STOFFWECHSEL workshop, the collected PADIDEH are confronted in a matrix with design tasks. In the image shown here four participants of a TRAVEL course in 2019-2020, Aaron Kopp, Natalia Posnik, Julia Holmgren and Hugo Lopez Silva, literally took the image of the matrix as a drawing board to explore the combinations.

The TRAVEL course ends with a matrix exercise in which all participants explore the PADIDEH formulated by them in relation to current design assignments for that context. The first sketches were commented on by the participants and selected, after which participants made models of the most promising results of the matrix exercise. As a final part the participants further developed proposals from other participants, which they found most appealing to the imagination. With this they confronted the original creators with a new layer of possibilities.

Because the TRAVEL program is an exercise, it ends here. The participants have gone from ENDEM to STOFFWECHSEL and will be able to apply the insights they have gained in their own way in their future as a spatial designer.

4. Conclusion

Search images succesfully guide us through the jungle of the built environment. They filter out irrelevant observations so that our brain capacity does not have to succumb to the constant flow of information from our environment. The extraordinarily useful tools that our brain has developed to enable us to deal with complex spatial situations immediately make our image of the world much more superficial and limited. We put it together especially for ourselves. In order to access the information that our brains classify as irrelevant in the built environment and therefore do not allow us to perceive, we need an analogue instruction to see better what we don't perceive automatically.

TRAVEL provides that instruction. Through encounters, explorations and experiments the programme enables future spatial designers, by means of travel, to discover their own preconceptions, to critically examine them, and to get to know their own position from the way they perceive their environment. By collecting and interpreting observations, future designers build their personal catalogue with *search images.* They use this catalogue to be aware of their own perspective on the world around them and act as a designer in that world with an autonomous mind in an applied context.

The prerequisite for being able to compile this catalogue of *search images* is the ability to explore the built environment with an open mind. This open mind does not necessarily appear to be present among future spatial designers. A designed programme of experience is necessary to invite them. By giving the various phases in the process of exploration and analysis of the built environment a name that appeals to the imagination, TRAVEL succeeds to remove the uncertainty in the confrontation with the unknown. Subsequently, the programme also enables them to use their own observations as personal special features in their designs. TRAVEL gives future designers confidence, curiosity and skills in gathering and interpreting information and developing personal design strategies from that.

Global Proximity: case studies of international and interdisciplinary collaboration between the USA, Italy, Guyana and Japan

Valeria Albani*[a], Paolo Cardini[b]

[a]Rhode Island School of Design (RISD)
[b]Rhode Island School of Design (RISD)
*valbani@risd.edu

Abstract | Engagement with local communities and diverse traditions of making, support to off-campus academic initiatives, promotion of art and design's relevance within a global context, all must aim to a crucial goal: *the creation of proximity*. This idea of proximity within global learning is a concept that can assume multifaceted identities.
In this paper, we will specifically focus on three layers of cultural interaction in which different parameters contributed to ensuring a rich and mutual learning experience. Tokyo, Rome, and Guyana's rainforest are the contexts in which those experiences happened through the setting of international and collaborative art & design studios. At the foundation of each of those case studies, there is the idea of "reciprocity," between US students, foreign realities, and local partners. Fostering global proximity means aiming for a double beneficial effect: the most immediate, and tangible one, is clearly represented by the work and thinking produced during those workshops. However, the most meaningful, and yet hidden effect is reflected by how students will reframe, and expand their creative practices and inquire in the future. A truthful global engagement that broadens perspectives, decentres experiences and reframes assumptions will allow a new generation of art & design leaders.

KEYWORDS | GLOBAL PROXIMITY, INTERNATIONALIZATION, CULTURAL RECIPROCITY, DESIGN EDUCATION, STUDY ABROAD

1. Introduction

Design is a form of culture, well seeded, interpreted and constantly revamped by the specific society in which is rooted and embedded. Social, historical, political and economic dynamics of each society heavily influence the way design, and design culture is spread, developed, taught, expanded, and even controlled. The current global context, in its complexity, often pushes for cultural homogenization and the multitude of local design identities are developing toward new and unexpected paths. Moreover, the ways of sharing design knowledge, within and outside specific cultural contexts, are unpredictably shifting. “The more tradition is weakened, the more subjects must learn to design their own lives and shift from a prevalence of activities carried out in a traditional way to one in which choices are mainly of design” (Manzini, 2015). The decay of local heritage systems forces designers and design educators to make choices that are no longer informed by strong local design identities, but rather are based on cultural cross pollination.

In this paper, the concept of “proximity” is identified as a critical tool for expanding the idea of design cultures. Gertler (1995) defines proximity as a necessary condition for partners to engage in an exchange relationship of knowledge sharing, transfer and acquisition. Social proximity refers to the “closeness between partners in an interaction” (Buchan et al, 2006), which affirms that the inevitable gap existing between two partners, in our case design cultures, must be physically bridged through unequivocal messages, and proximity plays a crucial role in building trust between collaborators willing to share k Buchan knowledge. In the past decades, cultural proximity has grown in an effort to respond to global issues of cultural imperialism (Schiller, 1969) that are becoming more and more relevant for the contemporary academia, and that west-based higher education institution can’t ignore anymore or exclude from their teaching philosophy and values.

But how about design proximity? Where does it place itself within the act of sharing design knowledge between faraway cultures? The idea of design proximity within global learning is a concept that can assume multifaceted identities. Design proximity is meant to somehow interrupt that expected one-way flows of culture between western countries and the global South. When different design perspectives enter in proximity from different part of the planet, the consequent exchange of knowledge and experience can help the reciprocal design cultures to evolve, acknowledge themselves, foster cultural belonging, reinforce their peculiar identities, and avoid to be kept in stagnant, monolithic structures and cultural silos that might not able to evolve, and sometimes survive.

Design proximity assumes new and deeper nuances when paired with a pedagogy based on experiential learning. According to Kolb, experiential learning is "the process whereby knowledge is created through the transformation of experience. Knowledge results from the combinations of grasping and transforming the experience." However, applying experiential

learning to creative disciplines fronts the fact that "the process of making has a solitary component" (Sutton, 2013) and this isolation can distance people and defeat proximity. But as Sutton underlines, the process of making "is immensely helpful to engage with others in a feedback loop, a conversation about the work in which the maker shows, speaks see, listens, and is listened to, a gathering of makers, each taking turns to be on the spot, showing their work and sharing the ideas behind it. This is the forum for understanding what was made and why. It is the conversation known as critique". In design teaching and learning, the critique is the space where the work is shared, and questions are answered. This space of critique is necessary for true design reciprocity, and the space of critique is only possible through proximity which comes back as a crucial condition for design knowledge exchange. This proximity can be developed by art and design higher education and institutions in multiple ways: by engaging their students and scholars with local communities and diverse traditions of making, by supporting off-campus academic initiatives, by promoting art and design relevance within a global context through design research.

2. Three case studies: the USA with Italy, Guyana, and Japan

This paper is an empirical observation of the pedagogical process through which distant design cultures have used proximity as key for a fruitful exchange. Tokyo, Rome, and Guyana's rainforest are the contexts in which those experiences happened through the setting of international collaborative art & design courses. In the following paragraphs, those experiences will be analyzed and will inform on how proximity can enhance learning and teaching within multicultural pedagogical frameworks. The case studies will specifically focus on three layers of cultural interaction in which various parameters contributed to ensuring a rich and mutual learning experience: methodological, environmental and social proximity. At the foundation of each of those examples, there is the idea of "reciprocity," between US students, foreign realities, and local partners.

2.1 Methodological proximity

In 2016 and 2018, 13 undergraduate senior students from the Industrial Design department of Rhode Island School of Design (RISD) travelled with their professor to Tokyo, to engage in a 3-week intensive bike building workshop. The course was organized in collaboration with faculty and students of Tokyo College of Cycle Design (TDC), Japan's first college focusing on bicycle education and the Japanese tradition of bicycle building. The workshop was aimed at each of the RISD students to practice the traditional Japanese, brazed Chromoly steel, handmade bike building process via an apprenticeship approach to learning and end their program with a full build experimental bike frame. In Tokyo, proximity happened on a methodological level: through the conjunction of the precision -and rigidity of the Japanese traditional local craftsmanship and the looser creative practice of RISD's students. The immediate skill acquired by RISD's students was the ability to design and build a bicycle

custom fit to their body. But the more broadly transferable skill students learn through guided instruction by the Japanese team was the discipline and focus of a precision-oriented process of making. Vice versa, Japanese students and faculty were challenged towards more explorative approaches positively disrupting the local craft canons. The result was an expanded methodological experience in which both designers developed an inherent synergy between contemplative and creative powers, illustrated by the difference between Japanese and western design. Daily self-reflective practices led by both the American and Japanese faculty, such as meditation and the creation of a process journal based on principles of Insightful Ideation, helped all students to increase their receptivity to intuitive and strategic thinking and cultivate a heightened sensitivity to precision, a careful consideration to details, and the simple manifestation of beauty within efficiency.

As Maturana and Varela (1992) assert, often knowledge and cognition have relevant implications, in particular on a sociological and ethical level, and the reality can be built through the action of coexistence. Along with the workshop, a new pedagogy was created. As Maturana and Varela discuss that the world that we know -and so our ways of learning, too – is not pre-given but enacted, and the learner should focus on how our action relates to the world we create.

2.2 Social proximity

In 2017 and 2019, a group of 12 students from different art & design departments of Rhode Island School of Design (RISD) traveled with two faculty to Guyana for 4 weeks to explore the artistic, cultural, economic, and scientific role of biodiversity in today's society. Guyana, a biodiverse English speaking Caribbean nation, located along the northeastern coastline of South America functioned as a fertile ground to experience biodiversity and nature and wildlife conservation from multiple perspectives, from natural and social sciences to humanities, design and visual arts.

This course provided RISD students with the opportunity to engage with local designers and scientists, participate in conservation science field research and have rich cross-cultural interaction. Across the entire learning process, RISD students collaborated with local indigenous community members and stakeholders to focus on critical conservation challenges, exploring the problem in depth and collaborating to produce art and design projects aimed to inspire conservation action. Skills and new knowledge gained by the local communities included collecting and analyzing scientific data used to study and monitor wildlife populations; observing, sketching, and photographing wild animals, plants, and landscapes. RISD students were also expected to create an archive of photographs, notes, sketches, sound recordings, and videos that will be used by the Amerindian community for future inspiration.

Proximity in Guyana happened on a social level, when design and biodiversity became a platform for social exchange. In the rainforest, Amerindian communities, natural scientists and art & design students worked together towards the democratization of artistic expression. Drawing, illustration, and new media merged and became a common language used to diffuse biodiversity values within the local communities. A new pedagogy based on social justice, experiential learning and sustainability taught students and local stakeholders on how to improve conservation policies through art and design. The new curriculum can offer inspiration for all higher education institutions interested in new approaches towards biodiversity, wildlife protection, and just human-animal-environment relations in the context of Guyana.

2.3 Environmental proximity

In the summer of 2017, as part of the Rhode Island School of Design (RISD) Global department's summer courses offering, students travelled to Rome for a four weeks class. The title of the course was "Sensing the City" and students were invited to observe and listen to the built environment and respond to it with interactive solutions. The class strongly promoted an interdisciplinary approach touching on various disciplines, from product design and physical computing to performances and video narratives.

In Rome, proximity happened on an environmental level. Through a deep connection and interaction with the city landscape and its embedded behavioral patterns, students were challenged to respond with digital technologies and robotics to the legacy and tradition of a millennial city. While forced towards a close physical relation with the space, Rome's hordes of tourists and labyrinthine structure, students learned and lived on their skin the cultural complexity of the Italian capital. In Spite of studying about Rome and its wonders, students "felt" it, "flaneuring" around, self-reflecting on their perceptions and identifying any multisensorial elements belonging to that specific context. The process of environmental proximity contributed to reduce as much as possible the distance between the individuals,

the students, and their environment, Rome, fostering an experiential learning based on empathy and responsiveness to the external surroundings. This proximity granted also a more genuine dialogue between a specific culture and who is willing to experience it in a limited timeframe; without trying to understand everything or fully blending with the local context, students expressed their impressions and feelings through their interactive installations.

Figure 3. "Rome, Sensing the City", course offered in summer 2017 by RISD Global. RISD RISD students creating wearable devices that interact with local environment. Photo courtesy by Paolo Cardini and Diane Derr, RISD and VCUQ faculty teaching the course. Rome, Italy, summer 2017.

3. Conclusions

Fostering global proximity means aiming to a double beneficial effect. The most immediate, and tangible one, is clearly represented by the work and thinking produced during those workshops. However, the most meaningful, and yet hidden effect is reflected by how everyone involved in the proximity experience will reframe, and expand their practice and inquires in the future: a truthful global engagement that broadens perspectives, decenter experiences and reframe assumptions will allow a new generation of art & design leaders.

Through the analysis of the case studies mentioned above, we recognize that the idea of design proximity works well either in contexts of diffuse design, that performed by

everybody (Manzini,2015) as we have observed in the Guyana course, as well as in the context of expert design performed by those who have been trained as designers, as in our Japan course. More than ever, higher education institutions have the responsibility to advocate for cross-cultural learning and educational exchange as a way to foster more responsible and sustainable ideas of the future. Design education within a global context must focus on sharing knowledge, practice, and expertise, with an open-minded perspective, through a multidisciplinary approach, and seeking meaningful reciprocity.

Design proximity can be seen as a pedagogical model to give students guidelines for a more conscious approach to the discipline. Moreover, a correct and careful application of the proximity principles illustrated in this paper can avoid reiterating problematic paradigms of cultural imperialism often present in western academia's study abroad and internationalization practices.

Finally, the idea of proximity is intrinsically connected with principles of coexistence, tolerance and empathy. Fostering proximity means to sustain a more inclusive dialogue and better understanding of the rich and messy kaleidoscope of cultures our planet is made of. Closing with a quote by Arturo Escobar, inviting people to leave in proximity will hopefully lead to that "world where many words fit".

Heritage and cultural accessibility: the role of design in the creation of an intercultural dialogue.

Marco Bozzola[a], Irene Caputo*[a], Claudia De Giorgi[a]

[a] Politecnico di Torino
*irene.caputo@polito.it

Abstract | This contribution intends to present a reflection in the field of design for the enhancement of cultural heritage in terms of cultural accessibility, and the implications related to the reception and integration of communities and social groups nowadays excluded. Within this context, design skills can be made available as tools to generate mediation processes between these cultural multiplicities, encouraging actions to enhance diversity and activating a dialogue between people and cultures. Design can devise strategies, services and integrated communication systems to facilitate meeting and exchange between the heritage and the multicultural community that lives in a territory.
By mapping certain virtuous design actions (at different scales, such as graphic, product and strategic design), we aim to highlight new possible approaches in the design for the fruition of cultural heritage, according to which the design act presents itself as a "translation" of values and identities for new and existing communities that cohabit in a territory.

KEYWORDS | DESIGN, HERITAGE, ENHANCEMENT, INTERCULTURE, ACCESSIBILITY

1. Introduction

The current process of globalization does not only bring radical changes in economic and political models, but also determines a huge “human movement”, linked to wide-ranging migrations and important social changes.

Faced with these great events, it is necessary to be able to re-establish a sense of confrontation, exchange and encounter both on the political level and in the cultural debate. We are part of an increasingly multicultural society characterized by the interweaving of lives and histories, usually distant from one another, but prone to the same dynamics that shape the territory and the value of its heritage. Therefore, it becomes necessary to create communication channels able to give value to people’s experiences in relation to the territories they inhabit.

Human migration, as a paradigm of a global and multicultural world, is not a new phenomenon, but while diversity is now a structural reality, inclusion is necessarily a mindful action which requires conscious foundations. This social complexity was rarely faced with a reflection and planning that also involved the cultural sector. But why could it be so important to focus also on the cultural sector? The power of culture is the ability to create new and surprising meeting places: spaces which are open; that promote knowledge; that allow people to get to know the “others” and their humanity; that help to create connections and to construct a different image from the common visions often presented by politicians and by the media. It is possible to consider culture as a virtual space that “make visible and give voice to what often remains invisible or silent” (Vlachou, 2017, pg.8). It is necessary for all people to have access to the knowledge and tools that will allow them to reflect upon and understand the situation we are currently facing in order to develop programmes and actions that can address the concerns and needs of the current society, including those of the newcomers. It is not an act of “handout”: some newly arrived groups represent specific cultures that require to be recognised and to be supported in their efforts to adjust and rebuild their lives in the new society and culture – be it through language provision, educational opportunities, skills development, or access to arts and culture.

2. Research context

The skills of design can be made available as a tool to systematise this multiplicity, promoting an innovation respectful of diversity, comparison and encounter between people and cultures.

Within this scenario, cultural heritage obviously plays a fundamental role as vehicle of identity and potential tool for dialogue between cultures.

Cultural heritage, as an expression of belonging, is an interpreter of the lifestyles developed by a community and passed on from generation to generation, including customs, practices,

places, objects, artistic expressions and values. Cultural heritage is often expressed as either intangible or tangible. As part of human activity, cultural heritage produces tangible representations of the value systems, beliefs, traditions and lifestyles. Therefore, cultural heritage is a wide concept, and – according to the definition given by the Italian Decree-Law n° 42/2004 "Codice dei beni culturali e del paesaggio" (Code of cultural heritage and landscape) – it includes artistic, historical, architectural, archaeological, and ethno-anthropological assets, but also book, archival, museum, natural or human-transformed, and environmental landscape assets. Tangible cultural heritage can be distinguished in three main categories: built environment (that includes buildings, townscapes, archaeological remains), natural environment (rural landscapes, coasts and shorelines, agricultural heritage), artefacts (books and documents, objects, pictures). As said, heritage is not only manifested through tangible forms such as artefacts, buildings or landscapes but also through intangible forms. That includes, for instance, cuisine, clothing, forms of shelter, traditional skills and technologies, religious ceremonies, performing arts, storytelling. Today, we consider the tangible heritage inextricably bound up with the intangible heritage.

In Italy, cultural heritage represents a significant asset both in terms of quantity and economic potential: taking as a reference the UNESCO World Heritage List, in Italy there are 55 sites of cultural and naturalistic interest, to which one must add the numerous intangible assets, also recognized and protected. In the report "Io Sono Cultura 2019" (I am culture 2019), published by Symbola and Fondazione Unioncamere, the direct economic value of the Cultural and Creative Production System in Italy was also carefully analysed. In 2018, it was close to 96 billion euros, or 6.1% of GDP, with the employment of 1.55 million workers (Symbola, 2019, pg.42). Moreover, "culture and creativity have a multiplier effect on the rest of the economy: the entire cultural chain produces 265.4 billion euros, 16.9% of the national added value, with tourism as the primary beneficiary of this flywheel effect" (Symbola, 2019, pg.10).

Reading these data, it is clear how a good planning strategy applied to this sector of analysis could have important repercussions also at an economic and social level.

This contribution intends to present a PhD research path in the start-up phase, which aims to identify certain methodologies and intervention tools, typical of the design discipline, for the enhancement of cultural heritage as a medium of identity and intercultural dialogue.

Within this context, design skills can be made available as tools to generate mediation processes between the said cultural multiplicities, encouraging actions to enhance diversity and activating a dialogue between people and cultures. Design can devise strategies, services and integrated communication systems to facilitate encounter and exchange between the cultural heritage and the multicultural community that lives in a territory.

This would allow the promotion of cultural accessibility and participation of all – including the categories at risk of social exclusion – and improve the interaction between indigenous and new citizens – creating synergistic relationships of openness and confrontation. This is

possible through exploration and construction of methods, tools, skills and innovative practices that make the cultural heritage (both existing and "imported") accessible and available, also through the definition of languages and communication channels aimed at new audiences. Cultural accessibility is here understood as a dynamic and methodological process, not a design goal (Bodo, 2009).

An interesting repertoire of orientations and approaches developed by European museums in response to the multicultural society emerges from some studies carried out in recent years, some of which have been made available through online resources to draw upon for the identification of so-called "good practices": such as for example the "Patrimonio e Intercultura" website, promoted by the ISMU Foundation - Initiatives and Studies on Multi-ethnicity; the Research Project MeLa* - European Museums in an age of migrations; the Compendium of cultural policies and trends in Europe, promoted by the Council of Europe in collaboration with ERICarts.

3. The role of design

The discipline of design has multiple and changing facets. One of its strengths is that of being a hybrid field whose design process needs to bring together and deal with many different disciplines.

Furthermore, within a structurally increasingly multicultural society, the pluralism of cultures and ethnic groups determines an increasing variety of audiences. A community that interfaces with different heritages and is made up of numerous actors who constantly shape socio-cultural contexts. In this reality in tumult and mutation, we therefore identify in the intercultural dialogue that process of open and respectful exchange between people and organizations with different cultural backgrounds and world views, designed to promote cultural diversity itself and the development of intercultural skills.

The role of design in facilitating the relationship between people (old and new citizens) and heritage can be structured in many ways. For example, through the creation of pro-active spaces: places that do not have a defined function, but rather remain open to several appropriation practices and uses; or through the development of communication strategies and exhibition practices based on strengthening the involvement of the visitors and their physical and emotional interaction with museum spaces; or also through the elaboration of new strategies for widening and strengthening the collection and museum content and communicating the plurality of stories which the related objects represent and embody; or even by creating new perceptions of heritage, for example by addressing the need to introduce temporary exhibitions in museum spaces or to bring "the museum out of the museum", that is, to create design practices capable of bringing heritage out of places of pure conservation, where possible , thus making it a real shared asset.

4. Case Studies

Through a mapping activity of certain virtuous design actions (at different scale such as from graphic, product and strategic design), we wish to highlight new possible approaches in design for the fruition of cultural heritage, according to which the design act presents itself as a "translator" of values and identities for new and existing communities that cohabit a territory.

With the case studies that will be presented, we attempt to define a number of potential scenarios in order to design new forms of museums, exhibitions and design actions able to respond effectively to the challenges of the present age of cultural complexity and stratification.

Specifically, as said before, we will describe certain interesting examples taken from the world of communication, product, or even strategic design. Sometimes all these design fields can be interconnected and therefore the division will not be so drastic.

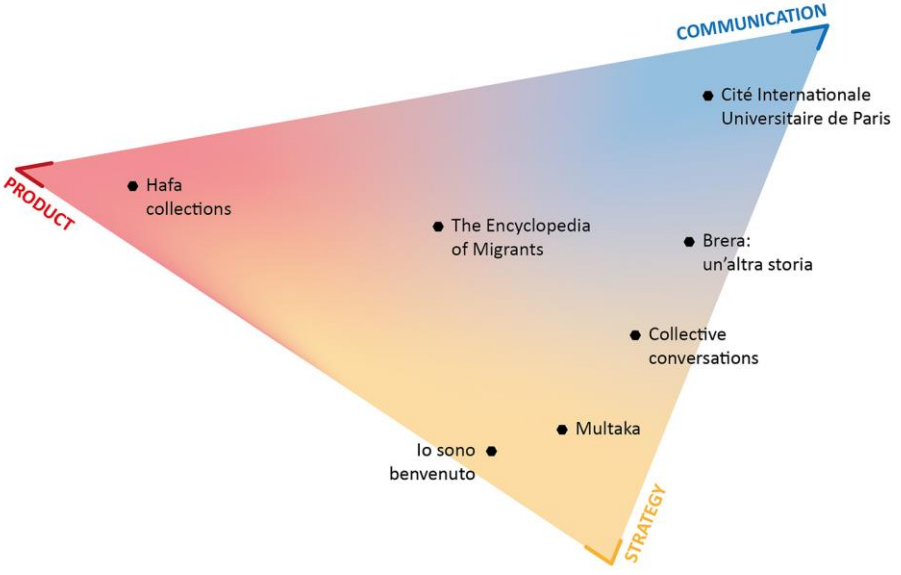

Figure 1. Case study analysis. How the different projects analysed are distributed in relation to the area of product, communication and strategic design (Credits: authors)

A first emblematic approach is represented by the wayfinding system designed by Ruedi Baur for the **Cité Internationale Universitaire** de Paris (2004); this is an example of how the interaction between visitor and signage system may be able to shape the perception of a space, also in terms of inclusion and cultural hospitality through the expressive languages

adopted by Baur with André Baldinger. In this case, in an intercultural scope, one of the main characteristics of the project is the font they designed: the Newut. As a matter of fact, the Newut font has the peculiarity that the height of the letter is the same for lowercase and capitals. This means that some letters can be replaced by non-Latin alphabet – such as Chinese, Greek, Arab, Hebrew, Cyrillic – characters whose shapes are similar to our own alphabet. A random variable percentage technique makes it possible to create texts that can be changed slightly by inserting foreign symbols, yet still be legible. By exploiting what is defined as the paradigm of the "orthographic priming" – according to which when a person reads, the position and shape of the letters are not strictly codified – it is possible to give the text a totally visual dimension that goes beyond its actual contents.

This project was bitterly criticised by those who believe it wrong to annex the symbols of other cultures "decontextualized" and deprived of their real meaning. But the fact remains that this solution creates a dynamic and chameleonic design in which the elements of visual identity, such as signage, seem ready to fit into a rapidly changing world. This wayfinding system not only fulfils its primary function – to indicate all the areas of the university campus – but leaves visual messages that are part of the university's complex, multiform and clearly multicultural identity.

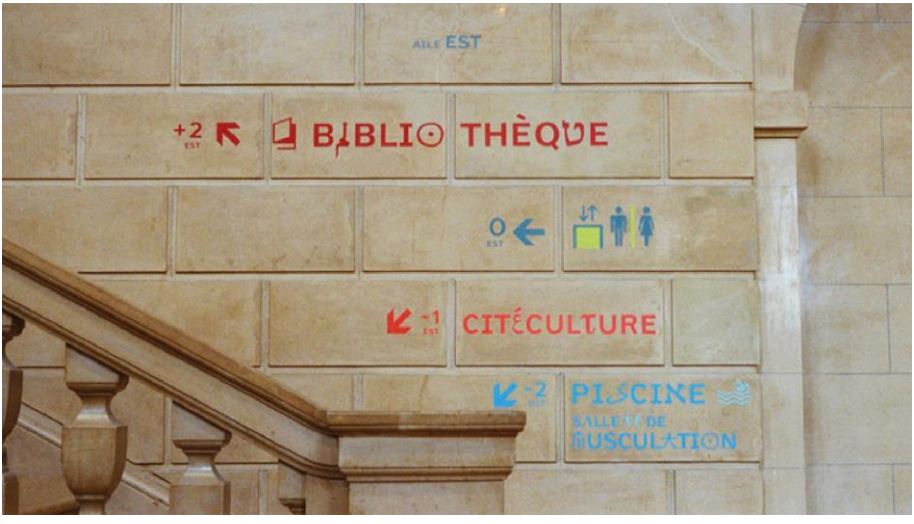

Figure 2. Cité Internationale Universitaire de Paris, 2004. Details of the orientation system in which is visible the application of the Newut font (Courtesy: Ruedi Baur)

Moving on to more case studies linked to the world of the product, the **Hafa Collections** project (1998-2001), coordinated by the architect and designer Milli Paglieri, sees the Piedmont craftsmanship, supported by Turin designers and Moroccan craftsmen, reinterpreting the forms of Arab living, recovering typical processing techniques of Marrakesh.

The collections were born in Italy, but changed over time, during their production. The interaction with the artisans, along with their processes and advice, modified and enriched the initial projects. All the collections aim to tell a story, and the different items become pieces of a story that is enriched over time with new elements. In 1998 the "Hafa Collection" was created: 12 Italian and Moroccan designers and artists have been urged to rethink furniture and furnishings in collaboration with skilled Moroccan craftsmen. By proposing apparently lost rituals, ancient materials and traditional processes, the creators have been able to find answers to many needs of contemporary living: the terrace environment, the space around the ceremonial of tea with low seats and tables, the numerous water outlets, and ambient light, typical of the Moroccan house, constituted in the designers' interpretation experiences of enrichment and contamination between the objects and western culture. In 2001 the project was enriched with the "Hafa Hammam Collection": a collection by Milli Paglieri and Paola Navone, who tried to reproduce the atmosphere, the perfumes and the beauty rituals of the hammam (thermal complex similar to a Turkish bath) with a line of body and skin care products and a series of objects and accessories.

The meaning of Hafa is “end-point”: therefore, it describes a boundary to overcome thanks to a new approach to design and product. Evocative objects, full of references to the two cultures and immediately attractive. “Double” objects – simple and complex, spontaneous and cultivated because they are telling a population’s story and material culture, and another population’s design culture.

Another interesting project, straddling the world of communication and product design, is the **Encyclopedia of Migrants**, that is an international project (2014-2017) supported by the Erasmus+ programme. It is based on a network of partners with different profiles (organizations, universities, museums, etc.) coming from France, Spain, Portugal and Gibraltar. The project was coordinated by the French organization “L’âge de la Tortue”, which works in the visual arts field. The initiative has had an artistic and experimental dimension designed with the aim to create an encyclopaedia both in printed and digital version, with approximately 400 testimonies directly made and written by migrants. The Encyclopaedia format was chosen in order to disseminate non-scientific knowledge, resulting from life experiences, with all the subjectivity that this involves. In this multi-volume, leather-bound book the care for layout and graphic design is visible and essential to the meaning of the project itself.

The main idea was to gather diverse accounts by migrants, which could be the source of a new knowledge, based upon the intimate and the individual. The most interesting aspect of this project is the idea that these life accounts are themselves interpreted as a heritage, to

be protected, remembered and spread, just as in the interpretation of Diderot and d'Alembert when they gave birth to the first Encyclopaedia.

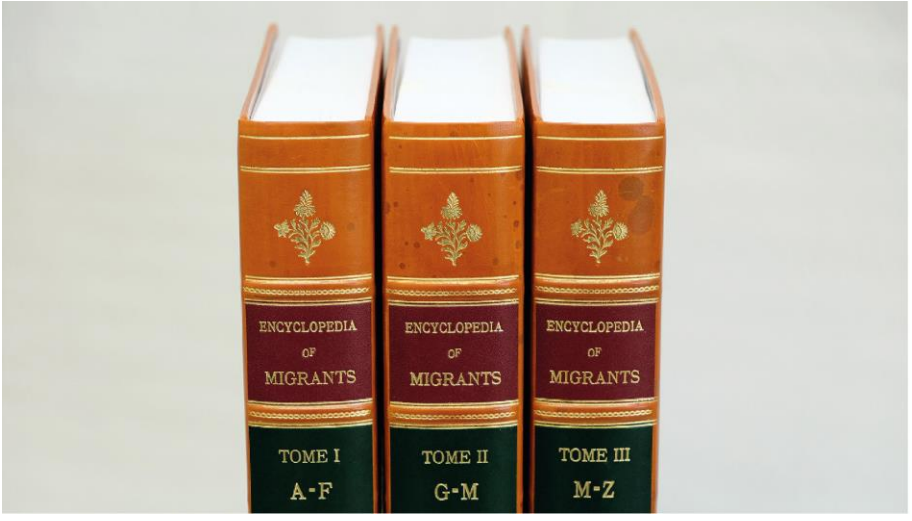

Figure 5. Encyclopedia of Migrants, 2014-2017. The three volumes that compose the encyclopaedia (Source: www.encyclopedie-des-migrants.eu – European cooperation project coordinated by L'âge de la tortue, at the initiative of the artist Paloma Fernández Sobrino)

The project **“Brera: un’altra storia. Percorsi interculturali nel museo”** (Brera: another history. Intercultural itineraries at the museum, 2014), held inside the exhibition spaces of the Pinacoteca di Brera (Milan), was an intercultural museum program cleverly narrated through video editing tools, in order to keep historical memory of this virtuous example.

This was an experimental project for the enhancement of the museum’s initiatives in an intercultural scope, and it was promoted by the Ministry for Cultural Heritage and Activities, General Directorate for the Enhancement of Cultural Heritage, and the Pinacoteca di Brera.

With the awareness that the museum is a treasure chest that contains a multiplicity of stories, the idea was born to bring out what works of art can tell each of us in a different and shared perspective. Thanks to the gaze of eight museum mediators from Bosnia, Brazil, Egypt, the Philippines, Italy, Peru, Senegal and Hungary, visitors to the Pinacoteca were guided to interpret the complexity and richness of the museum's works by discovering new meanings and unprecedented interpretations, until finding signs of contamination and reciprocal figurative influence.

The cultural and social relevance of the project lied in the promotion of different levels of accessibility: the development of a new familiarity between the Museum and “new citizens”, the promotion of regular visitors to new points of view on collections and, more in general, the construction of policies for access and participation aimed at an intercultural audience, not “segmented” on the basis of origin and nationality. Another strong point of this project is its narration through a video: this aspect of “historical memory” is often underestimated in the design of this kind of experience, however it turns out to be a fundamental element to give value to the project itself and to be able to take it as an example for the development of future actions, also structured on other realities.

Figure 7. Brera: un'altra storia. Percorsi interculturali nel museo, 2014. Selected moments of the guided tours (Credits: Erminia Sciacchitano)

This project may be linked with **Collective Conversations**: an audience development project of the Manchester Museum, active since 2004, which consists in filming the interactions of people with objects belonging to the collections of the Museum. Indeed, groups of participants use the museum's objects as a starting point for reflections, stories and narrations, often autobiographical; the videos of the "conversations", made by specially trained museum staff, are currently visible on the Manchester Museum YouTube channel (https://www.youtube.com/user/ManchesterMuseum/about) and from the direct links published on the museum website. These Collective Conversations started in 2004, following an acknowledgement that the Manchester Museum's collections had been relatively under-used by the surrounding communities and lacked important information regarding their history and community context. The project has gradually developed into a new operational model for the Museum to deal with issues of interpretation, documentation and display and to carry out a more inclusive work with diverse communities, by increasing physical, intellectual, emotional and sensory access and engagement through: involving a wide range of peoples in intercultural dialogue in a unique process of identification, interpretation and documentation of collections; piloting innovative inreach and outreach, recording and communication techniques; integrating the narratives into collaboratively-developed community exhibitions. In the Museum's own words, "Collective Conversations" is a way to establish the museum as a contact zone, creating a new way of working.

Figure 8. Collective Conversations, 2004. Frames taken from the YouTube videos (Courtesy of Manchester Museum, The University of Manchester)

On a larger scale and with a long-term strategy, we find certain projects developed by the Egyptian Museum of Turin – a reality that makes material culture a field of dialogue and constant promotion – among which **"Io sono benvenuto"** (I am welcome, 2017 - in progress), created with the aim of bringing foreign citizens closer to the museum heritage displayed in the museum and create an environment of inclusion and hospitality. This event is organized annually on the occasion of the "World Refugee Day" and involves an extraordinary opening of the Museum dedicated to the performance of numerous musical activities within the exhibition spaces. Access is free for all visitors, in exchange for a small welcome message to be placed on the Welcome Wall. This is a way for the museum to belong to everyone, as the director Christian Greco pointed out:

> "the museum becomes the place where all citizens, even those who have joined our community for a relatively short time, feel welcomed, learn about the immense heritage kept inside of our walls, and in doing so, they understand themselves and others better. This is the purpose of culture, to build bridges and break down barriers." (Christian Greco, 2017)

Figure 10. Io sono benvenuto, 2018. The Welcome Wall (Credits: Museo Egizio, Torino)

Another strategic project is the **"Multaka: Museum as Meeting Point – Refugees as Guides in Berlin Museums"** (2016 - in progress), in which Syrian and Iraqi refugees were trained as museum guides so that they could provide guided museum tours for Arabic-speaking refugees in their native language. "Multaka" (Arabic for "meeting point") also aims to

facilitate the interchange of diverse cultural and historical experiences. The guided tours involve investigations on historical objects relevant to contemporary debates, in order to establish a connection between the past and the present. In the process, the guides incorporate the visitors into the process of observing and interpreting the objects. In this way, through the mutual dialogue and the consideration of their own history, the visitors become active participants.

Through addressing visitors in clear and simple language aimed at all age groups and using peer-to-peer communication, the "Multaka - Museum as Meeting Point" project attempt to facilitate refugee access to museums, and to help them find social and cultural points of connection, as well as increase their participation in the public sphere.

5. Conclusions

The case studies presented demonstrate the possibility to activate an engaging dialogue between people and cultural heritage, in which everyone is treated equally and everyone has the same opportunity to access culture.

Specifically, these projects were born to pursue different goals, such as the creation of new languages and communication methodologies; the production of new narrative visions and re-readings of the heritage in an intercultural key; or to strengthen the bond between migrants and local heritage.

Design is therefore configured as an essential tool in structuring these strategic actions for integration. As it is evident in most of the case studies, the role of design is expressed in its most concrete form, such as graphic or product design. However, through a necessarily multidisciplinary approach (in which design skills are combined with skills specific to the field of analysis), design expertise may be expressed not only in its most executive form, but can also emerge as an important coordination and systemisation tool of the design process in its overall vision. In certain case studies presented, such as the "Io sono Benvenuto" or the "Multaka" projects, the figure of the designer is not explicitly recognizable within the project path: however, it can be interesting to observe how the inclusion of this professional figure could bring improvements in terms of exploration of communicative languages (different and more plentiful than those currently developed) and in the creation of more effective tools for participation and interaction with the public, capable of being put into use even without questioning the spirit of the project itself, but rather strengthening it through the union of more than one point of view. Designers are professional figures that, in participatory projects, must be aware – on the one hand – of the goals of the institutional collaborators – and on the other hand – of the needs, interests, and expectations of visitors.

By moving away from traditional guided tours to dialogue-based forms of outreach, this intercultural approach can become a pivotal part of the educational methods employed by museums and cultural institutions. Rather than focusing on communicating specific content,

the emphasis is on facilitating a dialogue between visitors with their individual expectations and what is being presented in the museum.

Cooperation projects play an essential role in cultural accessibility, enabling people to participate in the everyday cultural life of a city or community.

In order to concretely explore the possibility that cultural heritage can represent a powerful vehicle for intercultural dialogue, it is necessary to start an articulated process, based upon a "contextual and correlated development of theory and practice, which provides solutions in interinstitutional partnership and continuity over time in the field of heritage education, in an intercultural scope" (Bodo, Cantù, Mascheroni, 2009, pg.14).

A few specific reflections can be made concerning the modality of public involvement. To enable people to participate in the everyday cultural life of a city or community, cooperation projects need to be developed. It can be essential to work with associations and organisations of people with different backgrounds in terms of regional roots, religious beliefs, political orientation and national, cultural and social interests, in order to re-examine and re-explore the current narration of cultural heritage.

Immigrant Cultural Acculturation- A study of Tibetan Clothing in India

Anahita Suri
anahita@unitedidesign.com

School of Fashion Design, Unitedworld Institute of Design, Karnavati University, Gandhinagar, India

Abstract | The pursuit of preservation of cultural identity and search for an individual identity has led me to study various migrant cultures and their influence on design. The vibrant and spiritual Tibetan Buddhist migrants in India have always fascinated me. This research paper is an attempt to present a new perspective on the complex acculturation process of the Tibetans-in exile in India and its relationship to the clothing and visual culture. The data collected are narratives from the Tibetans that focus on variables like cultural differences, intercultural communication and intercultural relations that influence their experiences as well as a first hand observations of the life in Tibetan settlements in India. I aim to present the potential offered by Tibetan costumes as inspiration to be exploited creatively in a responsible way without offending anyone. This, I do, in a pursuit of positive cross-cultural adaptation between the two cultures.

KEYWORDS: ACCULTURATION, ASSIMILATION, APPROPRIATION, ADAPTATION, INSPIRATION.

1. Introduction

Myriad cultures form the warp and weft of the fabric of this world. The last century saw mass migration of people across geographical boundaries, owing to industrialization, globalization and political turmoil. These people took with them their cultures, costumes, traditions and folklore. The large flux of migrants around the world has sparked scholarly interest in acculturation, assimilation, appropriation, adoption and amalgamation.

The aim of this research paper is to understand the situation of the Tibetans in India, its correlation to Tibetan costume and culture in India (figure 1) and further, explore the potential of exploring elements from Tibetan clothing and visual culture to create something new and place it in a different context to make it contemporary.

Figure 1: A road trip through Ladakh, India showing Buddhist prayer flags against the barren landscape and Tibetan thangka paintings with visuals of deities. (Self-clicked images).

2.1 Cultural Exchange : Acculturation

Acculturation is a process through which a person or group from one culture comes to adopt the practices and values of another culture, while still retaining their own distinct culture. This process is most commonly discussed regarding a minority culture adopting elements of the majority culture, as is typically the case with immigrant groups that are culturally or ethnically distinct from the majority in the place to which they have immigrated. It can happen at both group and individual levels and can occur as a result of in-person contact or contact through art, literature or media. (Cole, 2019)

However, acculturation is a two-way process, so those within the majority culture often adopt elements of minority cultures with which they come into contact (Cole, 2019). This can include the uptake of certain styles of dress and hair, choice of food and music, etc. This research aims to explore this aspect of acculturation by focusing on clothing as an expression of culture.

Acculturation can take different forms and have different outcomes, depending on the strategy adopted by the people or group involved in the exchange of culture which in turn is determined by the extent to which the group believes it is important to maintain their original culture, and their willingness to establish and maintain relationships with the greater community and society whose culture differs from their own (Cole, 2019).

2.2 Cultural Exchange: Appropriation

Cultural exchange can either occur naturally through extended contact, or more quickly through cultural appropriation or cultural imperialism. Cultural appropriation is the adoption of some specific elements of one culture by members of a different cultural group. With the surge in population and growth of the fashion industry, there has been an increasing demand for innovative and individual fashion, from street markets to luxury brands. Exhausted by local influences, designers take inspiration from migrant cultures which they can exploit creatively. But unfortunately, the rich and vibrant Tibetan culture has escaped the fancy of designers in India and worldwide.

2.3 Cultural Exchange: Assimilation

Assimilation is the eventual outcome of the acculturation process, but the process can have other outcomes as well, including rejection, integration, marginalization and transmutation. Whether it is desirable for a given group to assimilate is often disputed by both members of the group and those of the dominant society (Cole, 2019).

Immigrant assimilation is a complex process in which immigrants not only fully integrate themselves into a new country but also lose aspects, perhaps even all of their heritage.

2.4 Cultural Exchange: Amalgamation

Amalgamation refers to a blending of cultures, rather than one group eliminating another (acculturation) or one group mixing itself into another (assimilation).

Today, many social scientists believe that integration, not assimilation, is the ideal model for incorporation of newcomers and minority groups into any given society. A person or group is encouraged to maintain their original culture while they are simultaneously encouraged to adopt necessary elements of the new culture.

3 Tibetans in India

Owing to the Tibetan uprising in 1959, about 1,50,000 Tibetan refugees, followed in the footsteps of His Holiness the Dalai Lama and fled to India. A second wave of Tibetan exodus took place in the 1980s due to increasing political repression. Even today, 3000-4500 Tibetans arrive in India every year in pursuit of cultural education and a peaceful life. All are given refuge in the little Himalayan town of McLeod Ganj- the seat of the Tibetan government-in-exile and home of His Holiness the Dalai Lama. Today, about 1,20,000 Tibetan refugees remain in India, spread across 35 settlements in Dharamsala, Karnataka, Odisha, Darjeeling and Sikkim. Besides, there are Tibetans located in scattered communities in various towns and cities of India (Thogmed, 2016).

Upon their arrival in India, the major priorities of His Holiness the Dalai Lama were the rehabilitation of Tibetan refugees, education of Tibetan children and preservation of Tibetan culture and identity. To realize these objectives, all Tibetan refugees were settled into a cohesive homogenous society and separate schools were set up for their children with their own curriculum. The Department of Religion and Culture was set up under the Central Tibetan Administration to preserve and promote Tibet's spiritual and cultural heritage (Paljor, 2017).

These people brought with them their culture, costume, cuisine and traditions. A walk through any of these settlements leaves you with rich visuals of Tibetan women in their chuba (long dress), pangden (striped apron), Buddhist monks in their chogo (red and yellow robes) and colorful prayer flags fluttering at every corner. The streets are lined with stores selling Tibetan jewelry and souvenirs and dotted with fabric stores and tailoring shops to cater to the needs of the community.

These people upon their arrival struggled to adapt to the dominant Indian culture, due to the vast cultural difference in religion, rituals, language, clothing and food habits. Their willingness to assimilate was low as they were introduced to India as asylum seekers rather than free willed migrants, leading to negative inter-cultural sensitivity and culture shock. This led to emotional expression and responses of hostility, anger, negativity, anxiety, frustration, isolation and regression. Combined with low economic standing, they preferred

to be clustered together, in large part due to a requirement to share resources in order to survive.

The Tibetan people's desire to assimilate is also disrupted by negative intercultural communication, institutional and interpersonal roadblocks that manifest from racism, xenophobia and ethnocentrism.

However, the second and third generation migrants engage more freely in the process of acculturation in order to reduce social friction. The new generation Tibetans develop better socio-cultural skills, move out of their settlement to attend school/ university in various parts of India, get jobs and try to blend in with the existing fabric of the society. But this is difficult as they are culturally and visually distinguishable from those culturally native to India. They are also afraid that of losing aspects or all of their heritage due to immigrant assimilation.

Most young Tibetans are educated in India and according to Mrs. Pema Gyalpo, younger sister of His Holiness the Dalai Lama, even though their cultural point of view is influenced by this environment, they are keen to preserve their identity (Hampton, 1985).

Figure 2: Tibetan prayer flags at Pemayangtse Monastery, Pelling, India, Enchey Monastery, Gangtok, India and Khelechopari Lake, Pelling, India.

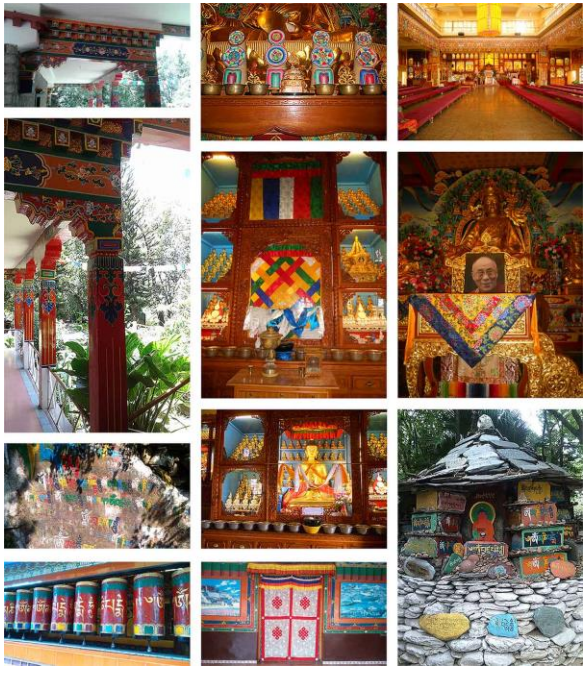

Figure 3: Tibetan religious symbols like prayer wheels, khata, butter sculptures, etc. at Karmapa Monastery, Norbulingka Institute and Tse Chokling Gompa in Mc Leod Ganj, India.

4 Tibetan and Indian Habits

Due to scarcity of water in the Tibetan plateau, Tibetans considered washing and bathing to be an unhealthy, harmful practice. As a result, many Tibetans would often be covered in a layer of greasy yak butter and dirt, their clothes caked in dirt and their hair matted. When they did wash, they rinse their face and hand in yak or goat milk. To protect their skin and beautify themselves, women applied a salve made of boiled curds. Some people went through their entire life without ever taking a bath. This made them the target of negative criticism by Indians who wash and bathe every day and led them to change their lifestyle. Most Tibetans have bright red cheeks- the consequence of high altitude, sun and winds. When they descended to the low altitudes, their skin became pale yellow. This further strengthened their dislike of life in India (Hays, 2008).

The most oft-cited problems for newly migrating Tibetans in India are the language barrier, their dislike of Indian food and the warm climate, which makes Tibetan clothing uncomfortable. Some also fear that their Tibetan culture is being diluted in India. (Thogmed, 2016)

5 Tibetans Emigrating Tibet Today

Within Tibet, Tibetans are losing their culture due to Chinese suppression. Significant cultural gaps exist between recent Tibetan emigrants and India born Tibetans. A prejudice of sorts against newcomers (post 1990s arrivals) exists in the Tibetan settlements (Martini, 2001). On the other hand, the Tibetan diaspora faces a threat of disintegration as many of the new generation exiles have started moving out from the existing Tibetan settlements and their urge to move to the west makes the situation worse. Moreover, Tibetans already settled in the west are in danger of assimilating into the western culture and lifestyle. Therefore, Tibetans fear that Tibetan identity will be wiped out completely and believe the only hope of keeping the culture alive is by those in exile. Hence, there is a resistance to assimilate into the Indian culture (Paljor, 2017).

6 Tourism in Tibetan Settlements in India

The past few years have seen a surge of tourists in these settlements, as a result of more awareness of different cultures, more disposable income and a desire to explore new places. Symbols of visual identification of these cultures- prayer flags, prayer wheels, thangkha paintings, singing bowls and cuisine like momo dumplings and thukpa soup- have made inroads into popular Indian culture.

However, there has been little or no cross-cultural adaptation of clothing cultures between the dominant Indian clothing styles and immigrant Tibetan clothing styles. Tibetan clothing is not available in markets outside their settlement. Even though the Tibetans disperse to the Indian plains for trading of woolen garments, their costume vocabulary remains untouched. Fashion and accessory designers have overlooked the rich inspiration offered by these beautiful wool and brocade clothing and silver and turquoise jewelry.

7 Tibetan Clothing

Tibet, though small in size, bears silent witness to their rich culture in the form of their attire and accessories. Unlike today's world of fashion, Tibetan attire and accessories, carry great significance to the culture and speaks volumes about their history, personal beliefs and the personality of the individuals wearing them. (Tsering, 2019) Tibetan costume showcases the beliefs of the Tibetan people. Old men love to wear clothes painted with suns and moons, which signify good fortune, happiness and longevity. The use of animal leather and the original colour of the wool shows the wearer's respect for nature. The costumes reflect the simple and pious attitude of the Tibetan people. (Meiling, 2018)

While influenced by neighboring cultures from China, India and Nepal, the Himalayan region's remoteness and inaccessibility have preserved distinct local influences and

stimulated the development of its distinct culture. Tibetan clothing is governed by the special environment and climatic conditions they live in, their animal husbandry and farming lifestyle, and lastly, by style and fashion. (Hays, 2008)

Tibetans are usually conservative in their clothes. They wear long-standing and unique Tibetan clothing together with vibrant coral, amber and other precious jewelry plus luxurious and beautiful gold and silver ornaments.

All in all, the clothing and accessories worn by the Tibetans speaks volumes about their love for expressing their culture and history through their art and clothing (Tsering, 2019). The Tibetans love of colour is evident in the way they decorate their clothes and homes (Hays, 2008).

The Tibetan traditional costume was added to the national intangible cultural heritage list in 2008. During the fourth China Tibet Tourism and Cultural Expo, held in Lhasa in 2018, models dressed in contemporary Tibetan clothing presented a potential opportunity to meld tradition with contemporary fashion. Li Mei, President of the Tibet Ethnic Dressing Culture Institute said, “the way people’s life has changed, so traditional costumes should also evolve to meet their new demands.” The institute which was inaugurated in 2018 September, aims to study the long history and culture behind the clothes, collect all existing patterns of Tibetan costume, invite experts to create innovative designs and help local apparel companies to grow (Meiling, 2018). Chemi Dolkar, an art and design teacher at Tibet University in Lhasa said, “People can learn more about Tibetan culture through this apparel. It is the most direct way” (Meiling, 2018).

Tibetan clothing is mainly categorized into the following, (Hays, 2008)

7.1 Women’s Clothing

The costume in adulthood rituals and that for unmarried females are quite different, which is a feature of Tibetan costume system. Usually, ceremonial clothes are much more gorgeous and solemn than ordinary clothes. Ordinary clothes worn by Tibetan females are long robes without sleeves, a silk/ cotton blouse underneath with woolen/ cotton pants and wide belt around the waist. Sometimes they wear jewelry symbolizing auspicious omen. In winter, they wear long overcoat that reaches over the knees or shawl made of yak skin, goat skin or sheep skin. Married women wear colorful striped aprons called pangden and slivers of white conch shells adorned with precious coral, silver and other forms of decoration in their hair. This is done to show the love and respect they have for their husbands. (19) Unmarried girls sometimes wear special costumes, implying the wealth of their family, so that wooers could estimate the dowry they would obtain. The illustrious women headdress, known as the bazhu/baguo, attracts the fancy of tourists.

7.2 Men's Clothing

Men's clothing: Tibetan men's clothing is categorized into Legui (working dress), Zhuigui (formal dress) and Zhagui (warrior dress).

Legui (working dress): It varies with the change of four seasons within the year. In spring and summer, men usually wear waist-level short shirt made of cotton or brocade laced with silk, and a long gown with round neck and wide sleeves. They put the long gown around their waist and tie the two sleeves overlapped on the back of the waist. The drooping parts of the long gown right reach the knees and form a pocket around the waist to carry portable items. The waistline, crotch and trouser legs are all very wide. Clothes in autumn and winter are all made of sheep and cow leather or man-made tufting. Long gowns are made of wool or sheep skin. They wear leather cap and Tibetan shoes with leather bottom and woolen upper.

Zhuigui (formal dress): It is the dress for grand festivals and ceremonies. The materials used in Zhuigui are quite expensive with exquisite workmanship. The upper Zhuigui is divided into inner and outer shirts. The inner shirt is usually made of silk in white, purple or light-yellow colors. It is a kind of Chinese-style jacket with buttons down the front and high collar, and the front of the garment and collar is laced with golden or silver. Some are also made of satin with different patterns and colors. The length of sleeves of the inner shirt reaches the wrist. The material for the outer shirt is brocade with patterns of Yuanshou, Miaolian and other flowers. The style of the outer shirt is same as the inner shirt, but without sleeves. The trousers are made of silk. The accessories for male include primarily Gawu(a silver box)and broadsword.

Zhagui (warrior dress): Fox-fur hat on head, Pulu laced with marten or woolen Chuba, long sword around the waist, the carrying of amulet, rifles and pistols enhance the beauty of masculinity of the handsome warriors.

7.3 Monk's Clothing

Monk clothing is simple and solemn. It is categorized into duiga (waistcoat), xiamute (monk skirt) and kasaya (patch worked wrap). In Tibetan costume culture, monk clothing is the most intact one that experienced the smallest change. When chanting sutras and praying, monks wear a huge piece of aubergine mantle Dagemu outside the Kasaya. Monk clothing varies in texture, colour and style according to the ranks and seniority. Ordinary monks could only wear duiga made of red pulu or wool. The ones wearing duiga and Kasaya made of yellow silk and satins are Living Buddha or eminent monks.

A Khata is a traditional ceremonial scarf given in Tibet. It symbolizes goodwill, auspiciousness and compassion. It is usually made of silk and is generally white in colour to symbolize the pure heart of the giver (Zingka, 2019).

7.4 Accessories

When it comes to accessories, the Tibetan folk pay keen interest in the way they project their rich culture in the form of art, clothing and accessories. Tibetans wear ornaments made of gold and silver as well as jewelry made of amber, agate, jadeite, pearl and ivory. Women wear earrings, necklaces, bracelets and finger rings. Men sometimes carry swords and wear earrings and bracelets. It is common to see women wear head ornaments made of silver, coral, turquoise, semi-precious stones and animal bones (Hays, 2008).

Tibetan crafting techniques like encasing, inlaying and wire drawing are used to decorate both, jewelry and religious objects like prayer wheels, barrels to hold rice for offering, sea snail shaped ritual horns, etc. The designs are derived from religious beliefs and convey special meaning. Most silver jewelry are carved with the six-syllable mantra, Om Mani Padme Hum, which is believed to have the ability to eliminate disease, prolong life and increase wealth. Pendants in the shape of Vajra (a ritual instrument for subduing demons) and amulets in silver or bronze with small boxes inlaid with pearls or precious stones containing clay images of Buddha, Tibetan pills, Buddhist paintings or photo of His Holiness the Dalai Lama are popular. Many handicraft and jewelry pieces' feature dzi beads which are regarded as given by God (Hays, 2008).

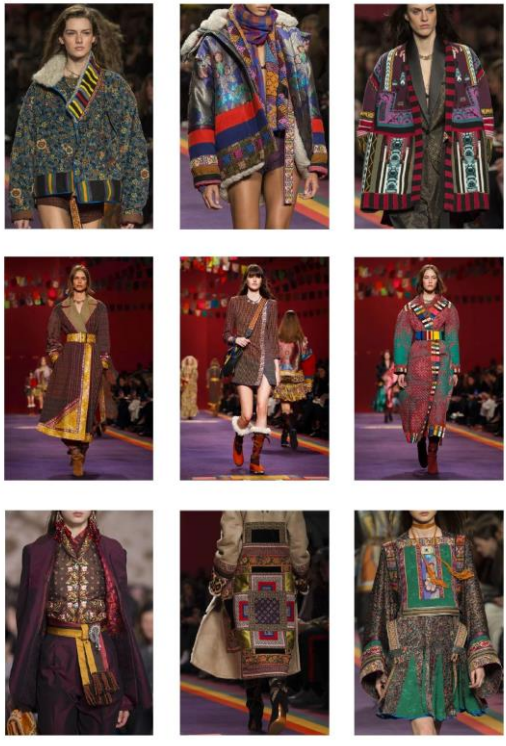
Except for the lamas and for certain laymen who shave their heads, Tibetans wear their hair either long or in a braid (Migot, 1955).

8 Beauty Pageant

Miss Tibet beauty pageant have been staged in Dharamsala. The Communist Chinese government objected to this pageant because it was seen as a sign of defiance to Chinese rule and an expression of the Tibetan desire for independence. Buddhist leaders opposed it because it apes western culture and mocks Buddhist philosophy. In December 2007, Miss Tibet withdrew from Miss Tourism beauty pageant in Malaysia, after pressure from China to participate as Ms. Tibet-China. (Hays, 2008)

9 Tibetan Clothing and Culture as Design Inspiration

Designers worldwide have overlooked this vast treasure of inspiration for creating contemporary, innovative designs. But this changed when below crisscrossed arcs of scaffold-hung prayer flags and against a backdrop with visuals of Nepal, Tibet and Bhutan, Etro presented their Fall Winter 2017-18 collection which celebrated the beauty of our sadly often mistreated Earth by acknowledging the power of diversity, transposing its main patterns to fashion. The eclectic and variegated pieces had mandala motifs matched with big colour blocked designs and juxtaposed with psychedelic patterns. The garments exuded a multi-cultural appeal (Leitch, 2017). (Figure 4)



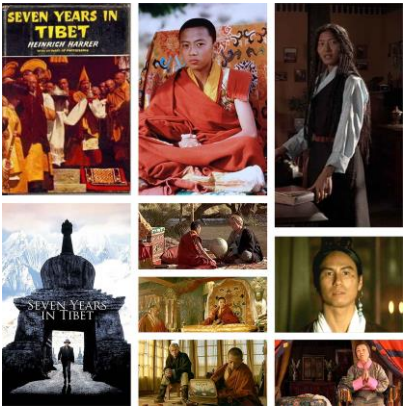


Figure 4: Etro's Fall Winter 2017-18 Collection.

10 Tibetan Clothing and Culture in Movies

Hollywood movies like Seven Years in Tibet (figure 5), Himalaya (figure 6) and Samsara have narratives set in Tibet and took the audience on breath taking and mesmerizing journeys

through the untouched landscape, people and culture of Tibet, giving a glimpse of all the hidden treasures this country and culture has to offer. Bollywood movie Paap (figure8), narrated the story of the struggle of a woman to join a Tibetan Buddhist nunnery. The vibrant colors of the monk's costume and prayer flags against the barren mountain is a visual treat.

.

11 Tibetan Clothing and Culture as Inspiration for my Design Projects

11.1 Project 1

My first project with Tibetan inspiration was as a Fashion Design student in 2005, where I used the visual imagery, elements like bell sleeves, metal buttons, enameled buttons and brocade fabrics to create a womenswear outfit (figure 9). The process strengthened my interest in this unexplored world and led to textual and visual research into the Tibetan culture and their struggles.

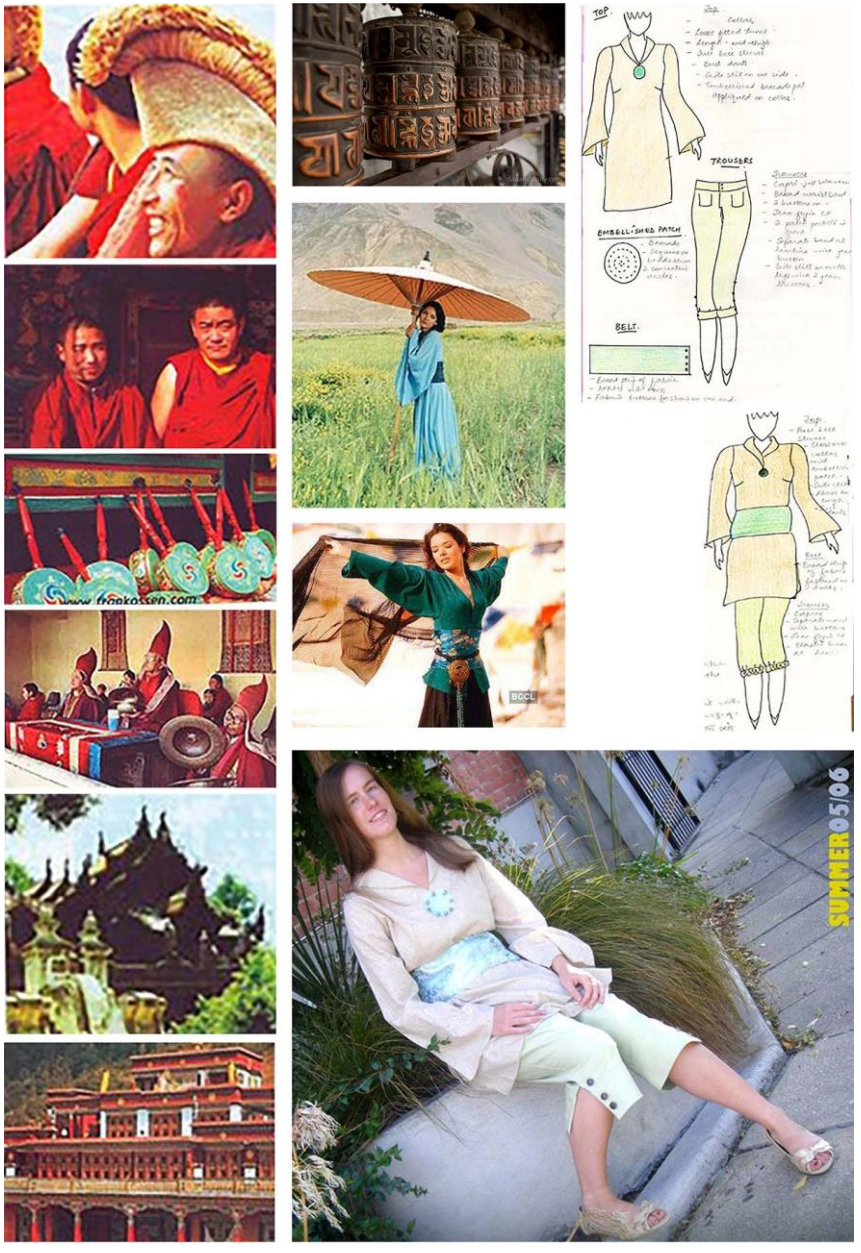

Figure 9: Inspiration pictures, sketch and final garment design. (Self-clicked images)

11.2 Project 2

The next project was my graduation collection titled, 'In Search of Harmony', drawing inspiration from the landscape of Ladakh, the prayer flags and the lotus flower- a symbol of compassion in Tibetan Buddhism. Made in khadi silk, naturally dyed with tea leaves and accessorized with necklaces and belts of hemp strings in colors of the prayer flags. As the tea dyed fabric fades away over time, it reminds one of the prayer flags that fade away in the wind, as the wind carries the prayers in all directions. The lotus petals inspired the vibrant pendants and brooches (figure 10).

Figure 10: My collection, In Search of Harmony. (Self-clicked images).

12 Tibetan Clothing & Culture as Design Inspiration for Design Graduates

I collected visuals from the personal albums of Tibetan friends in India and in November 2019, I conducted a mini project by sharing some visuals of Tibetan clothing among a group of fresh graduates of Fashion Design in India, to be used as inspiration for creating contemporary garment designs. The results are mostly visual, not conceptual and show the potential offered by Tibetan clothing to be translated into contemporary garments with a national and global appeal. Tibetan traditional costume with its bright colors, robe like design and use of striped fabric is given a modern, fashionable look. The graduates have used the striped pangden fabric in unconventional ways and used styles like cross over fronts. Combining elements like cross collar, raglan sleeve and colorful patterns with jeans and nipped in waist silhouettes appeal to style savvy customers while still preserving the key cultural elements (figures 12, 13, 14, 15).

Figure 12: Sketches developed by Sakshi Jain.

Figure 13: Sketches by Smriti Johar.

Figure 14: Sketches by Kajal Patra.

13 Conclusion

Tibetan refugee community in exile in India is considered as one of the most successful refugee communities in the world. They have managed to rebuild their lives in a completely alien environment achieving almost total economic self-reliance. Tibetan Administration in exile has succeeded in rehabilitating the refugees in a cohesive society creating an environment where Tibetans have been able to preserve their age long rich cultural heritage and identity. But the emigration, the uprooting has contributed to disruption of identities, low self-esteem and resistance to assimilation.

This research paper is an attempt to present a new perspective on the complex acculturation process of the Tibetans-in exile in India and its relationship to the clothing and visual culture. Design connects people and culture while bridging cultural gap. I hope to present the potential offered by Tibetan costumes as inspiration to be exploited creatively in a responsible way without offending anyone, with an awareness of crossing cross-cultural boundaries. This, I do, in a pursuit of positive cross-cultural adaptation between the two cultures by blurring the dividing lines.

Abstract | The contribution reflects on how the proximity between the actors of originally bottom-up Making Culture and public administrations can stimulate a virtuous urban Culture of Making, that is economically sustainable and well distributed in the city. The article starts with an overview of the "economy of Making" today on a global and European scale, focusing then on the Italian context. In particular, making issues in the regional context was investigated with a general mapping and a series of interviews, highlighting misalignments between the makers' initial objectives and the everyday reality of making. As a potential response, the contribution presents the partial findings of a European project that intervenes at the level of local policies to support the activities of design and distributed manufacturing manufacturing and proposes a format and toolkit that analyzes the ecosystem of makerspaces in a city / region, to then formulate operational proposals to support for innovative activities with an economic and social impact.

KEYWORDS | COLLABORATION, FAB LAB, POLICY, INNOVATION, WORKSHOP

1. Introduction

Building on a project currently underway within the Interreg Europe program, this contribution reflects on possible ways to improve activities in makerspaces, the virtuous places of doing where citizens connect to productive resources and to other citizens with the same. willingness to create tangible projects - be they single objects or products destined for the market.

As extensive literature demonstrates (e. Anderson, 2012 and Gershenfeld, 2005), makerspaces have the potential to bring industrial processes back into urban areas and into the hands of citizens by making them independent of mass production. These spaces offer specialized equipment and skills, so as to allow the performance of innovative activities to a transversal audience, making them able to respond to the problems of their immediate habitat - potentially with design solutions of various usefulness and worldwide diffusion thanks to the online community of makers.

The Research project object of this article starts from the observation of a problem related to the management of makerspaces, which rarely reach the theorized potential. Today, after the "pioneer" phase of the maker movement, self-organization, enthusiasm and in many cases, voluntarism are giving way to the growing need to establish economically sustainable models, drawing the attention of both the scientific community and policy makers. In fact, the project focuses on policies intended both as internal policies necessary to guarantee effective functioning, and as external policies to be implemented at the level of local or regional administrations.

2. Economy of Making

The evolution of Hackerspaces, from places of diffusion of a technological culture to Makerspaces as potential places of widespread production in the territory (Menichinelli, 2016) has brought traditionally informal DIY spaces (in all their forms such as repair cafes, fablabs to name a few formats) at the center of a new debate on the resilient city.

Most of the scientific literature is concordant with recognizing in Making Practices, intended as the combination of digital fabrication technology and open design, a revolutionary potential to define more resilient models of development. Such potential was welcomed as a response to the 2009 financial crisis, and has been theorized in models of diffuse capitalism, such as the *third industrial revolution*, and *social innovation*. Such "revolutionary" models have been progressively substituted by re-mediation practices as in the case of industry 4.0 or redirected toward less open practices as urban living labs.

Significant example is Barcelona (Spain) model of productive city, that in response to youth unemployment exceed 50%, and the traditional idea of the city as a place of consumption "products-in thrash-out" prosed a paradigm shift based digital manufacturing of the "data-in

data-out" type, (Gershenfeld, Gershenfeld, Cutcher – Gershenfeld, 2017). Such a top-down model based on a new infrastructure of Living Labs as places of open innovation boosted by private-public partnerships, is balanced by Fab Lab, hacker spaces and makerspaces as bottom-up workshops of social innovation. Barcelona experiment is represented by Barcelona Laboratori initiative developed by the city council to encourage innovation through public and private collaboration between the arts, science, and technology; (Capdevila, Zarlenga 2015) with specific claim “For the first time, peer to peer relations between City council and citizens is the main principle that is helping to Barcelona Laboratori to involve users […]” (Barcelona Laboratori, 2012)

This model of "self-sufficiency 4.0" promoted in the plan for the Barcelona Smart city in 2014, although it was superseded by subsequent city administrations, had two fundamental effects. On the one hand, the institutional recognition of digital manufacturing laboratories as places of culture is comparable to libraries in terms of representative role and type of use. The distribution of makerspaces (ateneu digital) in each district was, in fact, included ten years later in the current plan of "Barcelona Ciudad Digital" [1], integrating the informal network of self-managed spaces of bottom-up type into a new top-down cultural infrastructure (Capdevila, 2014)

From 2016 to 2018, it is possible to recognize a shift of the European perspective over the maker movement, from the civic role of commitment and engagement to a local economic booster role.

According to the Science for Policy JRC, stable policy and practical solutions to address new work challenges are more marginal in politics than in media coverage (Rosa, Guimarães Pereira, and Ferretti 2018). Regardless of the attention on EU and national levels, maker economies are relevant mainly on the metropolitan, urban and community scale, ranging from open innovation in manufacturing (as in North Italy example) to the innovation as cultural challenge (as in southern Europe cultural heritage applications).

Local and regional Public Administrations (PA) assume the role of fostering Maker economies with specific policies and programs to consolidate existing bottom-up communities or to seed them creating top-down public living labs of entire networks, thus elevating a new infrastructure model demonstrated in Barcelona to a European level. Among these there are notable examples: the French Fab lab network, the Italian MakER network of bottom-up labs in the Emilia Romagna region (Cattabriga, 2020) or the Fab Lab Lazio network of laboratories.

Meanwhile a closer analysis of the most relevant digital platforms highlights the current state of difficulty facing makerspaces. Between 2005 and 2018 there was a trend that saw the global number of fablabs doubling every year and a half (Gershenfeld, Gershenfeld, Cutcher – Gershenfeld, 2017), while 2020 data shows a contraction in the absolute number of laboratories: 1027 active fablabs in 2020 (fablab.io [2], October 2020) compared to 1120 fablabs in 2017 (Fasoli,Tassinari, 2017) and only 991 active Hackerspaces in 2020

(Hackerspaces [3], October 2020) compared to 1331 active Hackerspaces in 2017 (Niaros, Kostakis, Drechsler, 2017). This crisis is confirmed by a report from the Joint Research Center (JRC) which, circumscribing the European context, highlights a reduction in the trend of increasing the number of Hackerspace and fablabs since 2015 (Rosa et al., 2017).

3. Making issues in the regional context

To understand the recent phenomenon of maker spaces' decreasing numbers, we have developed a field investigation on the territory of Lazio region. The study was developed on 2 steps:

- Static snapshot: obtain an overview of the "maker culture" in Lazio, showing number, localization, openness and specialization of fab labs, maker and hacker spaces, through their digital presence and activity.
- Dynamic image: in order to evaluate the evolution of each maker community, in relation with their local environment, human and skills capital and proximity relation ability, we have developed a data triangulation based on institutional documentation, web platform presences and interviews.

3.1 THE MAKER SPHERE SNAPSHOT

The first analysis has found 53 maker labs, in which has been recognized: 21 Public laboratories with open users (Pub-O), 3 Public laboratories with referenced users (Pub-R) and 23 Private laboratories with referenced users (Priv-R).

In order to obtain homogenous data, a survey campaign has been developed involving all entities by means of e-mail and phone call to complete missing data. This first level of investigation recognized six categories of investigation in the context of Making that they explored respectively; the technological system, the range of services, the inclusion or relationship with a specific business network, the level of openness and sharing of projects, the company setting in relation to customers and the type of involvement in the projects developed within of its own structure (Figure 1).

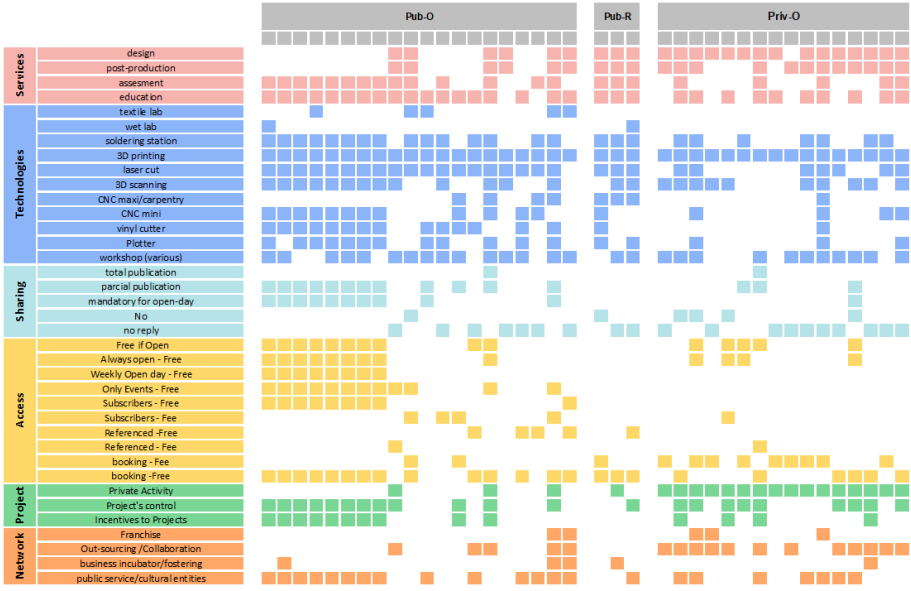

Figure 1. The table above shows the preliminary information retrieved from the internet and the feedback given to the specific questions made via phone calls by the laboratories which have been divided by their assets in three main columns (Pub-O, Pub-R and Priv-O). Coloured dots represent all positive answers given to the questions reported on the left side bar.

3.2 Maker COMMUNITY evolution

In order to evaluate social value and proximity impact of Lazio Maker Community, have been developed a interview campaign, to key person selected for their representativeness and relevant in cover special observation roles over maker realities in their environment.

The preliminary interviews have identified several realities with the most complete profile and in extremely heterogeneous relationship with each other. Among these, initiatives such as *FIRAS*, as an innovative startup that proposes itself as a real factory for the production of totally digitally produced components, and *Gulp 3D*, a small private business in close contact with the local community, have been investigated the most; the manufacturer of 3D printing materials *MakeAShape* as an activity between public and private as it is affiliated with the FabLab of Frosinone, followed by the association *FabLab Lazio*, whose coordinator and technical manager propose themselves as representatives of the entire network Regional FabLab, and the *Fondazione Mondo Digitale initiative*, for their open relationship and verticalized approach on digital manufacturing education. Those interviews were structured according to anthropological investigation methods, characterized by low structured

questions (the discourse flowing fluently through questions), long duration (always more than 45 min) and holistic evaluation (including non-explicit commented context).

Through an informal chat, the topics of which were prepared directly by the interviewees, the questions posed verticalized on the theme of the identity and role of the maker within the city (how it identifies as a service or service provider), and the contact o support of PAs (whether they are supported or not) and of project management when approaching a different clientele.

These interviews highlighted 3 main problematic areas:

- a widespread misalignment between digital and physical identities: community activity and face to face design development do not correspond to Open-Source design and sharing practices. In commercial relationships, many clients of the makers come from other regions, rather than from the same territory, even if initially they have established their lab after a local market study;
- regardless of the physical territory, there is a robust community characterised by strong, interdependent personal and professional relationships that do not correspond to a synergic vision of a new production/distribution model. In fact, digital craft is not considered as a relevant alternative for mass production among the interviewed labs;
- the FabLabs founded by public institutions are shifting their cultural objective: from spreading digital culture and open innovation to economy booster and project incubator, with an increased focus on intellectual property.

In order to pursue a resilient development model, new governance models are therefore necessary, capable of protecting makerspaces as places of physical materialization of the sharing and co-design practices of a consolidated digital community, in which sharing of technological tools and practices are concentrated. Incubators of new generations of urban entrepreneurs are active "for" and "with" the local community in order to collaboratively achieve common goals that are useful for society (Smith, 2016). In this scenario, the Urban Manufacturing (UM) project was born, funded by the Interreg Europe program, proposing a method to connect administrations and the maker world.

4. Urban Manufacturing Policy Toolkit

The goal of the UM project is to make both the shared creative space and the project and the adjoining innovative potential increasingly accessible and usable, overcoming those physical and social barriers that divide those who supply from those who use certain processes (Seravalli, 2014). To do this, it is necessary to consider in an increasingly precise and strategic way the needs of the local community to ensure better involvement and concreteness of the proposed solutions. To be truly effective, social innovation policies must

directly involve society, directly confronting the needs of citizens, so that the design and production activities can be identified as truly open and collaborative (Fleischmann, 2016).

UM through its network of 8 Universities, makerspaces and regional administrations, develops a format capable of guaranteeing public administrations a picture as clear as possible of the potential of the Maker economy, facilitating an entrepreneurship able to face the new ways of living and work in urban settings at the political level.

The format proposed by the UM project is structured in two phases. The first Investigation defines the necessary foundations to facilitate the work of makerspaces through three guided workshops: Policy Clinic, Makerspace's Ecosystem and Makerspace Design. In the second Evaluation phase, the results are reviewed in 5 sessions by another member of the partnership acting as external auditor, drawing on the skills and experience accumulated by the UM network.

Investigation Step 1: Policy Clinic

Framed as a thematic seminar, the first step strategically sets the initiatives that foster innovation, using best practices in their urban centers. The Policy Clinic suggests a limited time window, which allows different stakeholders and the Public Administration in different local contexts to approach under a specific agreed thematic topic. In this first step it is necessary to frame the actions undertaken by other neighboring and non-neighboring makerspaces (at least 3), in order to collect useful information according to pre-established templates. This allows you to work around 3 specific issues such as the type of challenge to be faced, the particularities of the case studies (makerspaces) visited, and the type of action one would like to undertake.

Investigation Step 2: Makerspace's Ecosystem

Therefore, assuming the inclusion of a project that looks to its audience, 4 fundamental phases follow in the development of the ecosystem:

Identification (emerging): by sharing different types of information, we identify the presence of measures to support the skills encountered, the presence of Makers in the local community, useful infrastructures and meeting events.

Growing: given the pre-existing situation, the survey shifts its lens to the Administration and its degree of openness to new technologies, to develop a vision of an "innovative city".

Support (sustaining): the quality of the infrastructure is questioned, what process the value chain follows within the city network and which other makerspaces collaborate on the initiative.

Exceeding: through the enabling technologies and the network thus developed, the new industrial policies of the city are developed together with the ecosystem of makerspaces together with the contribution of policy makers, defining thematic areas for making in the city.

Based on the involvement of the Administrations, the steps assume more or less relevance within the process, at the cost of considerable care in controlling the results and possible repetitions of the process.

Investigation Step 3: Makerspace Design

Through a template, the logistics of the available spaces are organized via a small group of space managers that guides the activity through 3 steps together with a member of the Administration, who will then be able to better understand the nature of the activities carried out and any support needs:

Empathy (empathise): participants identify with randomly generated profiles taking into account: social aspect, starting skills, availability and object of interest.

Definition: needs are defined on the basis of the following parameters: Accessibility, Atmosphere, Collaboration, Community, Creativity, Instrumentation, Experience, Innovation, Space.

Setting (create): based on the needs explored, the participants hypothesize the ideal organization for the space, as well as the most desired equipment.

Evaluation

The last phase involves one or more external figures from the 8 European cities that are partners of the UM project, who are able to contribute with experiences similar to those addressed. This confrontation phase is structured over two days. In the first, divided into two sessions of 2 hours each, external guests analyze the reports formalized during the previous steps and discuss useful information.

The second day the new policies are discussed, examining and refining in terms of feasibility the immediately following steps useful for their implementation. In order to address this work, in this 2-hour session at least three policy proposals are formalized which can then respond to the needs of the average user in a subsequent session, taking into account their perspective on the policy, the points of contact with the latter and the effects that the new policy will have on his experience.

In the last session, the roles of the participants are defined by appointing the coordinator, the approval process, the timing, and the origin of the funds (or budget allocated) that will support the project.

5. Establishment of new awareness of local production potential

As part of the UM project, which is still ongoing, only some of the activities (such as the Policy Clinic) have been completed by each partner at the present time. The Lazio Region,

the only Italian partner of the project, has identified problems regarding the commercialization of ideas: although the basic infrastructure has already been established and funding programs exist, so far, the transfer to the market has not been satisfactory. In response, the Policy Clinic workshop identified some possible strategies, for example facilitating the productive exchange of knowledge through “challenge workshops”; establish ways of sharing data and local issues, as input to work in makerspaces; differentiate innovation initiatives according to the gap between more and less urbanized areas; making the access of small businesses to regional makerspaces more fruitful through planning aid.

This last objective, particularly relevant for our discipline, refers to the ability to create a coherent and meaningful strategic vision (Design Driven Innovation, as described by (Verganti, 2009) for the company, in addition of course to the ability to improve quality of products and services already existing or designed by other figures. To put this policy into practice, a program of "Design Angels" has been established, i.e. young designers and researchers who will help a series of small and micro enterprises to achieve product innovations and process at makerspaces The activity, scheduled for 2020, has been re-planned considering the health emergency.

In addition to a static mapping, the Research intended to initiate continuous monitoring of regional makerspaces, in order to be able to measure the impact of the policies implemented and to be able to establish new programs according to the needs expressed. The collection activity involves different types of spaces including FabLabs, Hackerspaces, Makerspaces, Coworking, but also company workshops, entrepreneurs and small artisans - dedicated to a more referenced audience. To understand who the users are, other questions investigate the degree of openness or audience selection and control, design assistance services, inclination to co-design, and consulting services.

After an initial analysis of the completed questionnaires, a second level of Research of a sociological type, investigated some issues through unstructured interviews. Various initiatives are facing a period of readjustment of their business models, reassigning machinery, however present and potentially active, to different uses and services. The picture obtained of maker entrepreneurship confirms the state of crisis already found in the study of global FabLab and hackerspace communities, highlighting a substantial parallelism between the fate of makerspaces as cultural places and digital manufacturing laboratories as professional spaces.

6. Conclusion

Although the European Urban Manufacturing project (basis of this article) is still in a work in progress state, the activities carried out have already led to some interesting observations. First of all, the extreme heterogeneity of makerspaces is evident both among the members of the partnership and within the examined regional territory; in fact, the workshops held suggest an equally heterogeneous variety of policy interventions. A recurring element is the

need to better connect technical knowledge - virtually spread by the global Makers community - to design knowledge, a field of Design, which will be introduced as a catalyst in a series of small and micro enterprises through a new regional program specifically established.

However, there is a further front inherent in makerspaces as places for the diffusion of technological culture, which overcoming the logic of DIY and referring to co-design models goes beyond mere production. Design education, which in this context becomes transversal and transgenerational, indirectly assumes the role of training more aware citizens, connected both to the creative resources and to the problems of the territory, transforming them from consumers to proactive agents able to propose new solutions.

Making practice as narrator of changing social worlds-Textiles and the Scottish Borders, in the 21st century, but based firmly on the past?

Britta Kalkreuter

[a]Heriot-Watt University
*b.kalkreuter@hw.ac.uk

Abstract | The paper explores a variety of actors in the historic and contemporary textiles industry of the Scottish Borders with a specific focus on the region's collective understanding of place. It uses ethnographic, material culture based and archival probes into past and present textiles practices from education to industry and archive. It does soin order to explore current and past manufacturing activity in Scottish Borders textiles not just as economics or object based,and in its respective significance for the life worlds of makers past and present. In a dialogical construction of heritage narratives in the Scottish Borders, the paper provides some evidence on the nexus of heritage and innovation with some insights for other design actors keen tocompete globally from a local position.

KEYWORDS| HERITAGE, INNOVATION, PLACE, LIFE-WORLDS, CRAFT

1. Tradition and geography

1.1. Textiles in the Scottish Borders

Textiles traditions in the Scottish Borders have left indelible footprints on the built environment and the archival collections of the area, and textiles occupy much affectionate space in the region's collective understanding of place. A strong perceived link between the Scottish Borders' geography, community and industry feature prominently in the marketing copy of many local textile businesses and the tourism agencies, with rather nostalgic notions of a manufacturing heritage linked to a unique place, exceptional traditional skills and a niche economy dominating narratives; as is often the case where heritage is used as a selling point, the historic and contemporary realities of textiles in the Borders present as rather complex and at times contested (Varutti, 2015, p1038), however. This paper reports on ethnographic, material culturebased and archival probes into historic and contemporary reality of textiles making in the Scottish Borders. It does so against the backdrop of the region's continued relative success in the cloth related design industry, and in awareness of a strong and at times nostalgic attitude towards its fabric manufacturing heritage. The focus of research is on exploring current and past manufacturing activity in Scottish Borders textiles not just as economics or object based, but in its respective significance for the life worlds of makers past and present.

1.2. Heritage as practices that design a future

This papers' research looks at justone area and discipline but seeks to provideinsightsintoopportunities and challenges for a wider field ofdesigner-makers, micro-entrepreneurs and international corporations. It hopes to contribute to our understanding of how inciting heritage for design or manufacturing may be convincingly linked to a specificarea of praxis,in what one might term a culture of geographical proximity,and how this might position local businesses trying to weather the challenges of a global design industry.

The paper thus considers Heritage as a construct of the past as well as present and imagined futures (Smith, 2006), and it is interested in shining a light on how successful innovation might come to an industry that is known to project its tradition, and that tradition's link to a particular geographical place. In doing so the paper aligns with Rodney Harrison's view that

> "'heritage' has at times very little to do with the past but actually involves practices which are fundamentally concerned with assembling and designing the *future"* (Harrison, 2015, p35);

And by considering voices, documents and projects from across education, industry and the broader archive of historic expression, the research shares in the 'new heritage' paradigm proclaimed by Cornelius Holtorf (2013). The research further believes in Harrison's ontological politics of heritage, where "dialogue of heterogenous human and non-human

actors" becomes a form of "futurology" (2015, p35); a discipline, this paper posits, that most good design will be wise to associate with.

2. Some perspectives on education, place and labour in the Scottish textiles industry

2.1 Textile Education in the Scottish Borders

In its various incarnations, the School of Textiles and Design of Heriot-Watt University has played a central role in the textiles industry of the Scottish Borders over almost a century and a half. It was opened with strong industry backing as the Galashiels Combined Technical School in 1883/9 to serve as "the main important institution in the training of recruits for the industry" (Pattison in Silverman, 1946/ reprinted 2013, p129), but has since grown into a highly regarded provider of design education well beyond local manufacturers' needs. In adaptation to an internationally changing industry the institution added clothing manufacture and knit disciplines to its core around the time of its name change to the Scottish College of Textiles in 1968, majorly expanded its research portfolio into technical textiles, heritage studies and sustainable design since 2000, and more recently broadened its curriculum into interior design as well as digital manufacture and more (HWU 2020).

In the current climate of textile related design and production, barely a two-digit number of graduates find employment locally or start-up lasting businesses in the region, when in 1938 a large proportion of some 8000 thousand Borders weave industry workers had enjoyed day release training at the college at some stage of their working lives (Pattison in Silverman, 1946/ reprinted 2013, p101). Yet, the School of Textiles and Design has steadfastly resisted a physical move away from its semi-rural location, and while local economics and political pressures played a role in this, much of the narrative surrounding the loyalty to the physical location in Galashiels continues to be its position at the heart of the Scottish textile industry. The School's website to this day starts with its history as one of the oldest textiles teaching schools in the world (is it indeed the second oldest, pipped by a few months by Philadelphia, USA) (HWU 2020), when history is not de facto all that central to its current remit, reach or curriculum.

2.2 Perceptions of the Scottish Borders as a heritage place for the Textile Industry

A parallel emphasis on attachment to place can be witnessed in the Scottish Borders Textile industry itself. Its origins lay in a domestic handicraft industry that flourished into a woollen manufacturing centre thanks to a "plentiful supply of soft water" for scouring and finishing wool, and a good supply of labour, fed by tradition and training in the industry. (Pattison in

Silverman, 1946/ reprinted 2013, p 111-2) While by as early as the 1930s only a small percentage of wool fibres were still produced locally, the ample, soft waters of the River Tweed and its tributaries have retained a special status in the manufacture not just of wool, but increasingly the luxury fibre of cashmere (Johnstons, October 2019).

A skilled workforce, however, has more recently become a cause for concern to such a degree that Government action plans have been drawn up (Skills Development Scotland, 2019) and significant private (Textiles Scotland, 2019) and public (Hawick News 2015) resources have been diverted into rural skills development for the textiles industry in a bid to stem the gradual death of skills as the trained workforce ages. Not all initiatives have so far proved successful in terms of attracting long term recruits from the local community, despite significant unemployment in the region (Arnaud, 2019).

The Scottish Borders have in that sense become a place of some concern as business need to balance their attachment to real (water) and imagined (skilled labour) heritage narratives that connect textiles to the Scottish Borders as location.

2.3 Perception of uniqueness in the Scottish Borders Textile Industry

Rare craft skills and the limited edition or luxury production that almost inevitably follows are very key marketing currency in a fashion industry that increasingly bases quality on provenance, but the extent to which actual practices relate to such heritage varies markedly:

In the *Our Story* section of their website, the famous textile company Johnstons of Elgin declare pride in their

> "rich Scottish heritage" as "all stages of our manufacturing processes continue to take place in our own mills, deep in rural Scotland", with "many members of those communities becom[ing] our employees. (…) Providing high-quality jobs in our local areas is part of our mission. Over one hundred of our team members have been with us for over twenty years" (Johnstons, August 2019).

In a post titled 'Modern Heritage' the company interviews Company Chairman (sic) Jenny Urquhart and intern Sophie George who are both female heirs to the family business founded in 1779 (Johnstons, December 2019). Heritage for them first relates to values rather than practices as they mention support for the local community by providing meaningful employment, in an interesting inclusion of Scotland into a scenario more commonly associated with crafts of the Global South (Greru and Kalkreuter, 2017, p156). Modern heritage, the heirs of Johnstons continue in their marketing blog, also means continuing a philosophy of craft paired with innovation that started with novel fibre processing some 200 years ago, more recently introduced whole garment technology and currently considers co-bots to assist humans in the involved quality control process of such luxury products (Johnstons, December 2019).

While the actual effects of such automised production deserve closer scrutiny in a separate study, the company can claim some such adherence to values as it remains the biggest employerand provider of apprenticeships in the Scottish textile industry.

In contrast, Stephen Rendle, whose Lovat Mill in the Scottish Borders town of Hawick produces woven cloth for Chanel and Ralph Lauren, Paul Smith and Dries van Noten, points out that his company

> "keep things deliberately small here – just 220,000 metres of fabric a year with 21 people weaving 24 hours a day – to make sure that we create something really special"(Doig 2017).

In doing so, some production realities more often associated with the industrial revolution persist in the Mill, with less relevance to the expectations of a modern workforce, perhaps: Weaver Andrew Walton gives creed to Harrison's assembly of heritage in dialogue by various actors when we learn that he

> "recently switched from night to day shifts so that he could train a young apprentice in the craft" (Doing 2017), but posits at the same time that "the best thing about coming to work each day is knowing you're doing something to keep this industry alive. It's part of our heritage" (Doing 2017).

The practice of keeping looms running overnight is used as a practical way around the limited production narrative for provenance conscious fashion that is at the same time surprisingly cloth hungry as luxury label have become more accessible: a special cloth is produced in large scale quantities, by just 21 weavers, by maximising limited production facilities working day and night.But at the same time, in order to remedy a projected future lack of trained workforce (Arnaud, 2019) and to satisfy expectations of that modern workforce as well as contemporary training laws, the heritage practice of working day and night is in part suspended here in order to retain industries for the future.

2.4 Textile Labour in the Scottish Borders-life worlds through the artistic lens on archive material

Changing work patterns have been at the heart of the Scottish Borders Textiles industry's success before, and it is of interest how a darker side of the industrialisation of the woollen cloth industry in the Scottish Borders has been explored by artist Joe Magee during a residency in the Heriot-Watt University School of Textile and Design's Textiles archive in Galashiels in 2011. His research into archival artefacts and documents, and with reference to E.P. Thompson's seminal paper on *Time, Work-Discipline and Industrial Capitalism* (1967), was published under the title "SLEEP NOW, AND AWAKE IN HELL" in 2012. His series of silk screen prints and accompanying text traces Jean Pattison's society of 'domestic handicrafts' (in Silverman, 1946/ reprinted 2013, p111) and sheep farms in the Scottish Borders as they are transformed by mighty, water-powered mills and their capitalist demands. It is an

erawhen ‘clock-time’ became an instrument of control as it was “replacing earlier, collective perceptions of time flowing from the shared wisdom of human societies” (Magee in Harley 2012). The artist focuses on Thompson’s link between puritanism and industrial convenience, and a degree of equating looms that never rest with economic success rather than capitalist exploitation, persists in some heritage narratives of Scottish Borders Cloth as seen in the Lovat Mill quotes above. A life-world that is far removed from contemporary ideals continues to play a part in some heritage narratives seeking to ensure the very survival of the industry here.

2.4 Notes on production practices in the Scottish Borders industries from archived newspaper clippings

Concerns about the life-worlds of workers are not a new feature in this heritage industry: At the time of the worldwide recession of the 1930s staff at the Scottish Woollen Technical College in Galashiels pasted clippings from local and national newspapers in large leather-bound volumes that are still kept in Heriot-Watt University’s archives. The meticulous collection demonstrates a keen awareness of the transformational changes that were sweeping an industry just a decade after prosperous times for Tweed fabrics had seen their institution recognised as a National College in 1922. Representative of the many commentators bemoaning a decline in business is one who writes that looms now only work “30-34 hours a week” as “few repeat orders for the spring season of 1935 are being received” (Peeblesshire News, 28.12.1934). Some 10 months earlier, the same newspaper had reported on a public lecture by the College’s own Emeritus-Principal that was headlined ‘Some Plain Speaking’. In the article, Dr Oliver blamed a “Slavish Adherence to Tradition” for a lack of competitiveness, as weavers who used to service two looms when their mill was in the blanket trade now is responsible for just one dobby loom producing fabrics for clothing, with much time lost just watching mechanised production take its course. Aware of the danger of seeming unsympathetic to advancements in workers’ rights, he adds that “’Made in Scotland’ is not an empty commercial formula”, but that time gained through technological advances and change in business must be filled with productive work in tough economic conditions (Peeblesshire News, 05.02.1934). To Oliver, adherence to tradition is not a goal in itself as he lists some very real dangers of valuing it over progress and adaptation; and changes in life-worlds have very real consequences for an industry.

In the same volume of 90 year old news clippings, many interesting perspectives on adherence to design related traditions have also been gathered:

3. Some perspectives on local heritage and global style in the Scottish Borders textiles industry

3.1 Design and the Scottish Borders textiles industries in historic newspaper clippings

The Border Standard newspaper ran a full-page article on the Scottish Woollen Trade in March 1934 to present 'Findings of the Scottish Committee of the Council for Art and Industry' (Border Standard, 24.03.1934). 'Designers [are] urged to visit fashion centres' in the subtitle of a piece that makes a series of recommendations based on a large scale consultation exercise amongst 'representative' local mills, some London Industry and Design Specialists and the Scottish Woollen Technical College; it makes very interesting reading to the present day with regards to how it sees the balance of heritage and innovation in the Scottish Borders industry, and why:

The report seeks to counteract "an unconscious tendency to obsession by the limitations of the machine" and recommends that technical training should always go hand in hand with design and colour education. Sir Steven Bisland confirms in his report that a strong link to place and proximity exists in the industry of the 1930, as 130 small scale firms make up the Scottish Woollen Industry, often run "on a craft basis, in which successive generations of the same family had been connected, both as masters and men". On the question of design, the report noted an advantage in location "where the designer was in contact with the beauties of Nature, and could get his inspiration from them", but recognised that the depression-affected export trade now was in need of new ideas.

The same report was reprinted in several local and national newspapers throughout 1934, as publishers pressed upon its textiles 'born and bred' readership that a slowness to produce 'novelties' was to be counteracted by

> "designers (…) mov[ing] about more at fashionable resorts, at restaurants, and race courses", as "the industry was failing to benefit by the opportunities which existed for the development of the human side of the industry" (Peeblesshire News, 24.09.1934).

In an address to the annual dinner of the Edinburgh Borderers' Union in February 1935, another local industry insider,Thow Munro, put this apparent reluctance to look beyond the industry's heritage less delicately when he quipped:

> "Had the Border manufacturers been progressive and up to date? Within the confines of their own knowledge they had. From the point of view of producing beautiful goods suitable for every market in the world at an economic rate nobody had been better than they. But from the long view, and the realisation of present day conditions, they had not done well. They had failed to observe the great change that had taken place in the very clothing trade in this country and in every other country" (Edinburgh Evening Dispatch, 9.02.1935).

Munro here portrays the community of textile manufacturers in the Scottish Borders as rather insular and blinkered as they mistake their proud and tested traditions for a heritage that is fit in terms of Harrison's 'futurology'.

While these historic critiques refer to the dangers that ready-made clothing, shifting centres of fashion and increasing protectionism posed to cloth manufacturers of the1930s, if they stayed too closely wedded to their traditions of make and location, such perils are never far away from 21st century businesses either as they charter their course through heritage and innovation:

3.2 Design collaborations in some Scottish textiles industries of the early 21st century, seen through the Scottish Book

The last part of this paper will briefly consider some contemporary design collaborations with local textiles industry, showcased in the aforementioned *The Scottish Book*. A limited edition of 1000 of this publication was printed in 2012 to

> "celebrate the expert, the industry and the project, to showcase the work of inter-disciplinary teams, individuals and the cross pollination of knowledge and expertise from across education and industry in Scotland." (Harley 2012)

Even before opening the book one is struck by its heritage exterior, as, in the words of a photographer who contributed to it,

> "each copy is individually hand-aged with carbon paper, creating the idea of a lost record, rediscovered in some forgotten underground store." (Brown n.d.)

The publication was supported by Heriot-Watt University, South of Scotland Business Solutions, The Scottish Funding Council and the European Regional Development Fund as its foreword declares that

> "the demand and opportunity to maintain a global position of a traditionally based industry underpins the contemporary psyche of the Scottish Borders" (Harley, 2012).

The book reports on a large number of projects that met with mixed fortunes as far as longevity is concerned, and amongst the casualties of the requirement to show economic viability once public funding ends one ironically finds the STA(r) Multimedia Archive. It was conceived to provide access to the heritage of Scottish Textiles and help promotion of innovation that sought to provide knowledge-rich archives of textile design artefacts to provide a cohesive, usable and flexible access point to heritage and innovation (Harley 2012). The STA(r) archive was a project of the now dormant Scottish Academy of Fashion (HWU, 2011), and how the book reported on the same Academy's collaboration with Scottish stalwart Mackintosh will conclude the exploration of changing making practices in the Scottish textiles industry:
Students from Edinburgh College of Art and Heriot-Watt University were asked to 'collaboratively research' the 'Scottish heritage brand Mackintosh to realise new approaches

to design'. 'Expertise and skills' of the brand were tracked in the company archive and soon highlighted its 'industry standard hand-made manufacturing process', before students produced toiles that sought to innovate silhouette while the manufacturing remained traditionaland executed by the traditionally trained staff at the factory. The innovation here then consists of a separation of heritage rich industry production know how from the outward looking fashion sense of a younger generation of designers. These designers might be seen as unencumbered by too practical a knowledge of the Mackintosh tradition, and hence less vulnerable to the 'unconscious tendency to obsession by the limitations of the machine' that Sir Steven Bisland and the Scottish Committee of the Council for Art and Industry recommended some 80 years prior, as reported in the local press, as above (Border Standard, 24.03.1934). The Mackintosh brand has established itself in its own words as a

> "luxury name that combines updated technology with traditional techniques, heritage and craftsmanship, and seeks designer collaborations that highlight the collaborating designer's focus on "authenticity" and "unique savoir-faire" (Mackintosh 2018).

In marketing a more recent collection as Jil Sander+ crafted by Mackintosh, this casual separation of innovative design inspiration and heritage craft of making is even moreexplicit (Mackintosh 2020).

4. Heritage as curator of an industry's future

This paper has proposed some perspectives on the historic and contemporary reality of textiles making in the Scottish Borders through ethnographic, material culture based and archival case studies. In doing so it was able to link the region's continued relative success in the cloth related design industry to an understanding of heritage that is constructed from the past as well as present and imagined futures (Smith, 2006).
Ithighlighted instances where such heritage had less to do with an actualpast based on location or traditionof skills, but instead involved practices which were fundamentally concerned with assembling and designing a viable *future* (Harrison, 2015, p35). The wide scope of the case studies from across education, industry and archive allowed the research to align with Holtorf's 'new heritage' paradigm (2013) and tested Harrison's ontological politics of heritage for current textile businesses and their employees in the Scottish Borders, where dialogue between employees and technology, human and non-human actors becomes a form of "futurology" (2015, p35).
It is this nexus of heritage and innovation that most good design will be keen to explore further and associate itself with in a bid to compete globally from a local position.

Multiple narratives for multiple visions: engaging citizens in building future scenarios for their city through participatory design and storytelling

Davide Fassi[a], Annalinda De Rosa[b], Francesco Vergani*[c]

[a] Politecnico di Milano
[b] Politecnico di Milano
[c] Politecnico di Milano
*francesco.vergani@polimi.it

Abstract | The paper presents a context-based and cross-disciplinary research, reflecting on how a participatory design (PD)-driven approach, embedded with narrative structures, could stimulate citizens' ability to envision plural understandings of their own city. The project is focused on the city of Ivrea, recently named for its industrial past in the UNESCO World Heritage List as "Ivrea, industrial city of the 20th century", influenced mainly by Olivetti's transformative action. The applied methodology demonstrates how the hybridization of PD processes with storytelling can trigger civic engagement and resilience within local communities, aimed at overcoming latent conflicts related to their past through PD-led activities. The co-creation of a common narrative dimension, shifting between real and fictional worlds and intended as an exploratory process, could engage citizens in envisioning future scenarios for their city, triggering their capability of analyzing and reframing past(s) and present(s) towards possible futures.

KEYWORDS | PARTICIPATORY DESIGN, STORYTELLING, COUNTER-NARRATIVE, PERFORMING ARTS

1. Introduction

The approach and findings presented in this paper are based on the research project "Tango-Down Athena – Theatre and Design as hacking means of the contemporary urban myth" (TDA), run by the Polimi DESIS Lab of the Politecnico di Milano University, in collaboration with CRAFT - Centro Ricerca Arte e Formazione Teatro, a theatre research and training centre, and endorsed by Cité du design research centre (France), Tongji University (China), and supported by "Compagnia di San Paolo" foundation. TDA is a cross-disciplinary project that explores, by means of storytelling, the idea of "myth" in relation to urban spaces. Through design-led envisioning processes, the project aims to explore the influence a myth can have on the transformation of contemporary cities, its imaginary and its identities, through the development of a counter-narrative (Fuad-Luke, 2013) that is able to activate new meanings for the local communities and to offer a balanced articulation of their own past(s) towards future scenarios. The paper presents the first two phases1 of the project, focusing on how the use of narrative methods triggered awareness and broadened envisioning capabilities within a wider and ongoing process of transformation.

1.1 Contextual condition

The TDA area of intervention is Ivrea, a city in north-west Italy. The context was selected in 2018 following the registration of Ivrea in the UNESCO World Heritage List as "Industrial city of the 20th century" for its industrial past, and influenced mainly by Olivetti's transformative action. Thanks to the economic, social and cultural policy of Camillo and Adriano Olivetti in the middle of the last century, the city underwent a successful development model. The industrial area of Ivrea, developed between 1930 and 1960 according to Adriano Olivetti's vision, proposed an alternative model to the 20th-century national and international experimentations of urban industrial areas, of the *company town* and industrial systems developed in large urban agglomerations. The area includes buildings for production, offices and study centres, but also for social purposes such as residential units, public services, and summer colonies, as well as centres for training and various cultural, sporting and recreational activities. Therefore, the company's development affected the whole urban pattern, becoming a laboratory for spatial, cultural and social projects and ideas. For more than thirty years, Adriano Olivetti tried to apply and redirect the urban conceptions that were being explored in the national and international debate and entrusted to the most significant Italian architects of that period. His death in 1960 marked a break in the city's

[1] The project is divided into four phases: 1) "Scientific assets" (from January to April 2019), a research phase on the definition of the relationship between urban myth and the urban model, analysed through scientific literature, some emblematic cases, and with a focus on the city of Ivrea; 2) "Co-design activities, community activation, urban installations" (from April to October 2019), a co-creation phase, involving local informal groups and associations; 3) "Theatre production" (from October 2019 to June 2020), the writing phase of a plot linked to the urban activation resources; involvement of design students for the spatial definition and realisation of the set; production and replicability, as well as in other contexts; 4) "Dissemination and communication" (from July 2019 to June 2020).

history, ending a period of commitment of the factory towards its own territory. The change in the factory's leadership led to a consequent change in its vision, which led in its turn to the slow but inevitable interruption of the former activities and the final fragmentation of its architectural heritage.

1.2 First mapping

The overall legacy of the city and its golden age was considered to be an f oundation on which to build up a project concerning the notion of the urban myth and its potential for cities today. During the first phase of the project, the research team had to approach a relatively unknown context by getting in touch with places and communities and collecting data about Ivrea's past and present using desk and ethnographic research. While framing the context with representatives of local organisations and informal groups of citizens[2], a far more diversified background emerged than expected, one that was filled with conflicting opinions and visions.

This phase highlighted the early interpretation of the context as the sum of *overlapping geographies*, linked to the city's different souls and identities and connected to the city's heritage and memories. The concept of *overlapping geographies*, introduced by the authors, has been conceptually devised to mean elements of territorial diversity that have changed over time. These different portions of the city are mainly the results of a series of cultural and historical changes which occurred according to the city's development over the centuries. The configuration of the territory and the presence of the Dora Baltea river generated a geographical distinction between the northern part of the city - the old town - and the southern - the modern town. The first is characterised by a medieval urban pattern, which once a year becomes the scene of the nationally recognised carnival. The southern part developed during the twentieth century thanks to the presence of industries (primarily Olivetti and, later, Montefibre[3]). The main purpose of the UNESCO candidacy was to stimulate a relaunch of this area and, therefore, of the entire city, towards a functional regeneration that would boost Ivrea as an innovative technological and cultural pivotal point, as it used to be in the last century. However, the concept of *overlapping geographies* not only refers to the physical meaning of *geography*, but to a broader one, including social, cultural and human identities. In trying to allow local citizens to gain a deeper understanding of their identities and visions, a general sense of immobility and hopelessness emerged that connected the majority of people in the Ivrea community. This is mainly due to the myth of the Olivetti family as creator of a golden age that has now been lost, and has devided the citizens' perceptions of this heritage. If, on the one hand, this legacy is constantly re-proposed by communities as a unique and irreplaceable period in history, on the other hand,

[2] Relationships were established by first getting in touch with the experts who have been in charge of writing the candidacy report. This first step then led the authors to get in touch with people from cultural and administrative institutions in Ivrea.
[3] Montedison Fibre, funded in 1972 and, for years, one of the largest Italian companies for the chemical sector.

it is somehow uncomfortable for those who are trying to move towards a future of possibilities that are disconnected from Olivetti's past. Throughout the years these different visions have generated latent conflicts and difficulties in mutual recognition, which is of course crucial for defining a common direction for the future of the city.

This extremely rich set of differences stimulated critical thinking about how historical, cultural and social changes, if not metabolised, can produce frictions within communities. How is it possible to boost communities' resilience towards proactive actions? How can PD approaches, tools and methods help to stimulate people's capacity to act?

2. Objectives

The cross-disciplinary process of the project required the understanding of participatory activities to be opened up in terms of key methodological approach, thus researching how a PD co-creative process can trigger awareness within local communities. For the design discipline, this means to be able to cross borders in order to design systems, strategies, and experiences rather than objects, visuals, or spaces (Muratovski, 2015).

The project investigated diverse levels of engagement to tackle the contextual complexity, made up of controversies and opposed perspectives, conducting within this given situated context a social conversation towards a non-solutionism(-based) (Manzini, 2016) process. This required an in-depth understanding of the role of PD-based activities, not for creating an alternative future but for envisioning one while shaping a better present. In fact, PD and Design for Social Innovation (DSI) practices are not only necessarily meant to empower communities towards efficient, durable, scalable and replicable solutions, but also towards questioning/re-framing the public realm, possibly triggering the participation of citizens and other local stakeholders such as associations, administrators and policy-makers in the democratic debate concerning the public realm. This could only be done by not pursuing all-encompassing and definite solutions but by diving into the contextual complexity, which allowed the difficulty to create a common voice to emerge, when there is no sense of a shared community or a mutual knowledge to be recognised and undertaken. This voice is needed in order to support the proliferation of *"*a more favorable environment for the birth and development of a multiplicity of other projects, even though they do not contribute directly and immediately to the solution of a specific problem*"*(Manzini, 2016, p. 57). In this sense, design activities, including visions, *"*can increase the probability that new solutions will emerge and can help them develop in greater synergy*"* (Manzini, 2016, p. 57).

The whole process aimed at nurturing the ability of citizens to envision and gain awareness of what is possible in terms of inner human resources. The essential matter of the design-led part of project was how to connect people's *"*active [and] agential role in changing the process of construction of social realities*"* (Kemmis & McTaggart, 2005, p. 573) towards a series of activities specifically designed for the reactivation of local communities.

3. Methodology

The Polimi DESIS Lab adopts a strategic and systemic approach to design and investigates the way design can support and trigger social innovation, combining creativity and visioning with the capability of engaging in co-design processes with a community-centred-design approach, particularly focused on the development of prototyping artefacts for the service and spatial design in urban contexts and towards the development of solutions for social innovation. Design artefacts, in the larger sense and beyond tangibility, are complex systems affected by – and affecting – a relational network of processes, interactions, bodies, things and ideas constantly in flux, where lives, societies and history unfold, in a world which is constantly becoming (Fox & Alldred, 2015).

TDA is a project that lays its foundations in direct contact with the communities of citizens and their context of belonging. By means of the practices borrowed from PD, an attempt was made to articulate a participatory path to highlight the potential citizens have as an active community able to act for their own well-being. Although the first phase of exploration of the territory brought to the surface the presence of a enthusiastic and diversified structure of identities, the inability to converge this pluralism into something truly proactive was also encountered. The research team aimed to trigger *agonism* (Arendt, 2013; Mouffe, 2000, 2007) within public spaces, that is the capacity of human plurality to establish a public sphere fuelled by a political and democratic dialogue to be then translated into concrete actions. In trying to articulate this proactive debate, it was decided to use storytelling and narratives as a tool with a transformative power to generate processes of change (Tassinari et al., 2017), and to funnel a shared vision of a hypothetical fictional world that overlaps the real one. This means reinterpreting what is familiar (real) through a process of abstraction (through the lenses of the fictional) to, then, return the uncovered meanings and understandings of their own resources into a new familiarity (Kemmis & McTaggart, 2005).

To stimulate an active debate on extremely sensitive issues for the community of citizens is a process that nevertheless requires a significant level of abstraction from the context. Letting people discuss their unfamiliarity with divergent issues is an extremely delicate practice. Starting from the structuring of a process of increasing awareness – which is typical of PD approaches – the project explored a correlation between places and temporality within PD, hence the added component of narratology. According to Jung (2014), narrative, as one of the ancient forms of communication, has its own way of delivering concepts and information, using archetypes as developed elements of the collective unconscious. The effectiveness of the use of stories as a practice for understanding, by means of PD, dormant needs and future scenarios, is to be found in its being a mental framework for the cognitive organisation of human experience (Bruner, 1991; Plowman, 1996). Furthermore, using storytelling and narratives as a tool for exploring and encoding the context has the exceptional ability to trigger a process of abstraction: people > characters / actions > events / places > scenes. This process of abstraction emerged as a challenging area of reflection for

the PD field due to its ability to bring democracy, agonism and politics to an enhanced and fictionalised surface where communities can feel comfortable in discussing present issues and future visions, and avoiding the fact of feeling too attached to reality. Transferring physical places and personalities to a fictional level of action is a way to support, by means of stories, the participants' imaginative ability towards a broader design capacity, since "stories offer examples on how we can face and manage conflicts in everyday life and generate processes of change" (Tassinari et al., 2017: S3491). This transfer of elements between real and fictional worlds has also emerged as a useful strategy in other disciplinary fields. An example is what is defined as narrative embedding (Lane & Maxfield, 2005), largely employed in the marketing field, where the use of narrative and its peculiarities is applied in place of the collection of data and analysis in orienting individual actors towards the future.

The development of a parallel and fictional narrative world leads the researcher to perform the role of the narrator, carrying out a work of construction of the imaginary in which s/he tries to direct a process of awareness (through the production of knowledge) by a community of people. In order to trace all these elements, the research team provided participatory tools borrowed from game, service, and spatial design as well as narratology, philosophy and sociology disciplines. The whole activity was conceived mainly as a co-generated game and used devices such as cards and props to stimulate the envisioning capacity of the participants. All the elements were specifically designed to help the co-narration develop among the citizens, and provided a solid basis to trace all the insights and information useful for the research purposes.

4. Project

Starting with the objective and methodologies described above, the activity specifically designed for Phase 2 of the project focused mainly on:

- the creation of a community map of the city based on objective deductions and subjective memories/experiences related to local communities;
- the use of storytelling as a design discipline's co-generation tool to funnel visions (in terms of stories) set in a hypothetical fictional world that can be later brought back to the real one to enhance citizens' resilience;
- the definition of a toolbox made of characters, places, events and narrations as a basis from which to develop an immersive performative act (Phase 3 of the project).

The activity was conducted with four groups of citizens from Ivrea and the surrounding areas, as well as members of associations and informal groups, and experts in the cultural sector. The groups were also heterogeneous through the presence of participants of different ages, thus allowing for a more diversified interpretation of the territorial context. The activities were carried out in the spaces of the railway station managed by the Zac! Zone

Attive di Cittadinanza, a well-established cooperative that collaborates with citizens through social and economic approaches together with conviviality and solidarity.

The co-design (or better *co-narration*) activity was set in order to guide participants between real and fictional worlds, through the deconstruction of narrative in its fundamental elements: characters, actions, places. The co-creation session of narration with local citizens was divided into two distinct activities carried out in sequence:

- Activity 1 "Building a common narrative world": creation of a shared – both physical and conceptual – vision of Ivrea starting from the narration of subjective and objective memories of the participants.
- Activity 2: "What if... - Living the fictional world": development of a possible future scenario within a fictional context, where participants are abstracted into another level in terms of temporal and spatial dimensions through storytelling elements. The process of abstraction is triggered by the introduction of a disequilibrium element (hacking) that generates an imbalance. The story, created by the interviewees, uses the narrative world of Activity 1.

The two activities led to the creation of a story-making toolbox made up of characters, places, events and narrations. The toolbox, delivered to the partners of the TDA project, will be used as a starting element for writing the interactive performance (currently under development).

4.1 Activity 1 - "Building a common narrative world"

The first part of the activity was designed to stimulate a greater awareness of place through different interpretative levels that are able to give back a community (and objective) map of the city of Ivrea. Starting from some recognisable elements, the group was asked to define a map through a joint discussion on the physical and mental perception of the places in Ivrea. In addition to defining spaces (*thematic areas*, *borders* and *special places*), questions were asked to identify characters and events that were particularly related to the memories and stories of the participants.

The development of the first activity was requested by the research group which set itself up as a narrator by defining a series of steps:

1. **Introduction (blank map)** - Participants were provided with a print depicting the stylised map of Ivrea showing only the river (the Dora Baltea) and the railway axis.
2. **Thematic areas** - Subsequently, with the use of stickers, the group was asked to provide further specifications about the location of places and thematic areas they considered fundamental to the recognizability of the city.
3. **Borders** - The identification of areas and places allowed the circumscription of Ivrea within a confined space. The shape of the city changed throughout the

activities conducted with different groups of people, as a result of the conception of the individual participants.

4. **Special places -** Individual participants were asked to identify two places each that were related to particularly important past memories and experiences.
5. **Characters -** As the final step of Activity 1, participants were asked to identify some noteworthy characters related to local people (real and imaginary) who could be matched to a series of archetypes.

4.2 Activity 2 - “What if... - Living the fictional world”

The second part of the activity aimed at creating a story in a hypothetical fictional world in which the city of Ivrea has faced a significant event that has shaken its sense of balance. Starting from the map co-created in the previous phase, the participants were called to imagine an alternative world to be used as a setting for the definition of a self-contained narrative arc composed of a set of characters, tools, places, unexpected events and actions. The activity was aimed at stimulating group awareness as to how to recover from a destabilising situation through proactive actions that would enhance the communities' resilience.

If in Activity 1 the participants were asked to take an approach more linked to their personal experiences and behaviours, in Activity 2 they were encouraged more to imagine solutions within a process of teamwork. Furthermore, the personification of a fictional character limited the participants' possibilities of action to specific characteristics and skills, adding a further level of difficulty in creating the story. Activity 2 was conceived as a role-playing game; all the events and the progression of the story were recorded on cards to create a complete story, from the first chapter to the epilogue.

Activity 2 was completed over several steps:

1. **Traces from the fictional world** - Participants were provided with three different boxes containing different prompts (1 photograph, 1 object and 1 newspaper article) from the city of Ivrea set in a parallel world. They were then asked to trace the fictional world through the description of social, historical and environmental characteristics linked to previous hints. The different prompts are connected to hypothetical future changes in terms of climate, social, cultural evolution.
2. **Alteration event** - The participants were presented with a short narrative of a change (identified through a natural disaster caused by non-human agents) which led to a change in the city of Ivrea. Here resilience is required and is closely related to the ability to “bounce forward” and “move on” after a disaster (Manyena et al., 2011; Manyena, 2006), conceived as changes related to floods, the energy crisis, desertification due to global warming, or depopulation.
3. **Creation of the heroic community** - Subsequently, participants were asked to draw character cards (some new and others generated in the first part of the

activity) connected to specific archetypes. All the characters together defined a heroic community, i.e. a team that had to act together to overcome the situation. Participants, associated with a specific character, had to act consistently with the skills of their game avatar to proceed in the story.

4. **The game** - The game consists in building a Hero's Journey (Campbell & Moyers, 2011; Vogler, 2007) in which the community of characters is brought to face the change at places pointed out in the first part of the activity (special places). To move forward in the game, participants have to roll the dice and then draw a card from two different decks: the first contains *tools* to be used, the second contains *unexpected events* that change the course of the game.
5. **The narrative arc** - Even if the story was generated collectively each character was chosen to be the protagonist of a particular step of the game. In each step, the protagonist had to create a story chapter considering the characteristics of the fictional world created, the skills of the character card, and the tools found along the path. The group of participants had to outline a self-contained story structured in ten chapters, trying to combine characters, actions, tools and places.

Figure 1. Graphics of the tools used in the activity. The blank map served as the board on which to play the game.

Figure 2. The development of a story's chapter by participants and other prompts used to create the fictional world. The picture was taken at Zac!'s spaces in Ivrea, on the 25th of October 2019 during the co-design session with citizens.

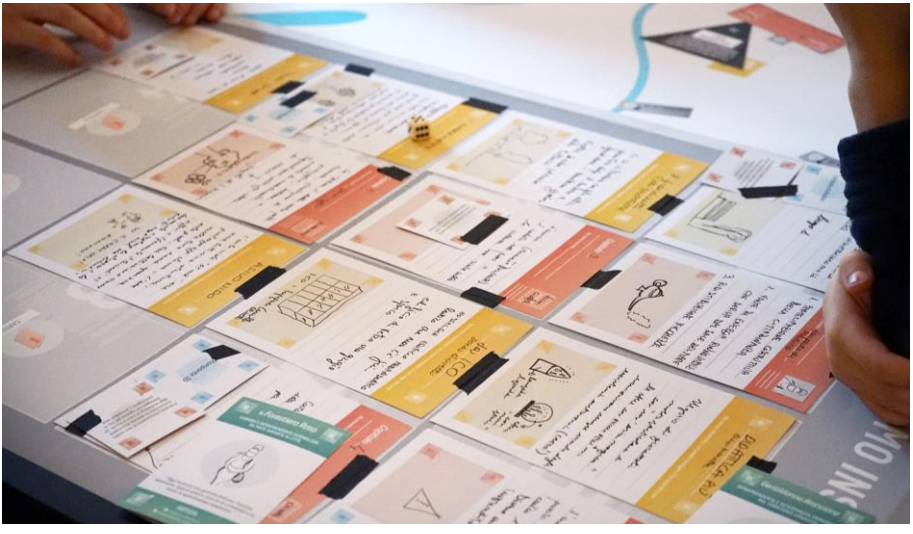

Figure 3. "Special places" and "Chapter" cards are matched to define the progression of the story. Each card had a blank space where to sketch a quick visualization of spaces and actions. The picture was taken at Zac!'s spaces in Ivrea, on the 25th of October 2019 during the co-design session with citizens.

5. Results

Both the contextual conditions and the expected outcomes were somewhat challenging and therefore interesting to explore. First, the project location was atypical for the Polimi DESIS Lab: the research team had only a previous indirect knowledge of the context and its inner dynamics. This meant that the risk of a superficial commitment was high during the ethnographic exploration and in providing networks and activities, and also because of the short duration of the project. In this specific case, the character of the expected design outcome – a potential social change powered by the co-creation of alternative narratives – and the consequent lack of traditional tangible outcomes of the project's goal challenged the research group, raising questions both about the effective agency of the project's design innovation and the difficulties connected with such an open-ended, ephemeral outcome.

A central challenge for PD today is to embrace a cultural and humanistic re-balance, able to question not only viable solutions, collaborative knowledge construction and systemic change, but also the human action of inhabiting. This challenge means actively exploring alternative ways to tackle the context-based design process, where the interaction between people and the environment is a primary issue, intertwined with an attention towards temporality which is not only about reflecting in terms of short-/long-term effects and impacts, but rather moving from a linear and univocal interpretation of the temporal dimension, to a resilient and open-ended way of expressing different visions and voices, which are more related to the human (and non-human) dimensions.

Working with a community of citizens rooted firmly in the history of the city provided a double level of interpretation. On the one hand, it helped to cement our understandings of the territory, while on the other, it allowed us to test a series of approaches related to the theme of resilience. The idea of splitting the activity into two parts helped the participants experience a conceptual and emotional swing through the initial development of a sense of control, and the subsequent annihilation of the same with the consequent need for reconstruction. Activity 1 helped the formation of the teams take place in a relaxed atmosphere through personal emotional experiences, while the story making-focused Activity 2 unsettled this apparent sense of control, stimulating the same teams to act towards a possible solution. The participants were themselves associated with the experiences of their game avatars, even if on a purely fictional level. The activity allowed the research group to effectively test, even on a limited sample, the capacity for resilience of urban communities and their attitude in dealing with situations of potential uncertainty. At the end of the activity the participants were agreeably impressed by the challenge as they were initially unaware of the second part. Even if tested on a purely fictional level, most of them expressed a sense of satisfaction in understanding the number of actions individual citizens can undertake in a team. In their opinion, the activity also served to help them empathise more with their own territorial and social context, which was all-too often criticised. The objectives of the work have been effectively verified, triggering different

points of view in the community about the role they, as citizens, can play in improving their condition.

All the elements traced through the activities will now build the foundations of the interactive performance to be staged by CRAFT association. It will be interesting to observe how a PD co-creative process, its methodologies and approach, as well as the deconstruction of narrations, will then be reinterpreted by the peculiar language of the theatre, where the individual plot-spectator relationship owns, potentially, endless interpretations.

New Technological Space for Tourists. Design as a Trigger of Experience, Osmotic-Membrane Interface, Know-How Provider and Social Engager

Luisa Collina[a], Ilaria Bollati[a], Claudia Mastrantoni*[a], Umberto Tolino[a]

[a]Politecnico di Milano, Design Department
*claudia.mastrantoni@polimi.it

Abstract | Milano is considered the liveliest and creative metropolitan area in Italy. It is now involved in four current tourism migratory fluxes toward the city, and it is opened to welcome a wide range of new Metropolis actors: professional, professional travellers and tourist practices. Their needs are *accessibility*, *adaptability*, and *inclusion*. Are there any aids that can promote their experience and increase the link with the living spaces, usually taken for granted? Nowadays symmetrically, mobile technology and location-based services are an excellent novel opportunity for cities and their cultural institutions to reach a wider audience. In this essay we introduce a project designed to welcome tourists and citizens in an environment where analog and digital technology meet creating a multi-sensory experience. The final purpose, providing different stages of the process, is to demonstrate how Design can be a *Trigger of experience*, *Osmotic-membrane Interface*, *Know-how* provider and *Social engager.*

KEYWORDS | SPATIAL DESIGN, INTERACTION DESIGN, TOURISM, CULTURAL COMMONS, USER EXPERIENCE

1. Who are the actors of the new metropolis?

*"*Cities are complex systems, with emerging qualities which cannot be reduced to static understandings or representations*"* (Lupi, 2013, p. 1). Talking about cities, from their planning to their living, means activating fields of dialogue with more and more connotations. It means taking into account not only the urban morphology and architecture, but even vibrant and ever-changing networks of human flows. In this sense, the *Urban fact*, as defined by Aldo Rossi at the end of seventies, becomes matter of the man and, nowadays, it is rapidly changing (Bollati, 2014). It is being intensively reshaped by unexpected dynamics:

> "on the one hand, the rise and growth of the digital economy has deeply modified the relationship between the urban fabric and its resident community, overcoming the conventional hierarchy based on manufacturing priorities; on the other hand, contemporary society appears to be discovering new labor conditions and ways of making things, crafting new synergies and connections" (Trimarchi, 2019, p. 1).

Today, cities compete for liveliness and quality of life (Morea, 2019); (Hall, 1998); (Richards & Palmer, 2007). In this regard, in 2018, during the first Domusforum, *The Future of Cities* was discussed, emphasizing the cities' complexity in terms of architecture, economy, social sciences and citizens' emotions. The proposed analysis based on a survey commissioned by *Domus* and executed by Nielsen, gathering and measuring of consumer data, showed Milano as the liveliest and creative metropolitan area in Italy, with high quality of urban life and urban atmosphere. Thanks to its smooth, permeable, versatile and flexible urban backbone, Milano is able to encourage new flows of ideas, contents and experiences reciprocally fertilizing (Bollati & Collina, 2020). It is able to be adaptive, to make space inclusive and to make time managed, becoming more and more appealing. It's no wonder that today is involved in four current tourism migratory fluxes toward the city and it is opened to welcome a wide range of new Metropolis actors: *newcomer, traveler*, *globe trotters*, o *city* user (Domus, 2017). Therefore, it aims to be attractive for workers, residents and tourists *"*to effectively respond to the complex need for an eloquent representation of the self*"* (Benincasa, Neri, & Trimarchi, 2019, p.10).

2. Tourism: an evolving concept

The concept of tourism can be defined from various points of view, one is connected to person who travels to a country other than that in which s/he has his/her usual residence but outside his/her usual environment for a period not exceeding one year, and whose main purpose of visit is other than the exercise of an activity remunerated from with the country visited. This definition shows tourist's activity as a search for something different in comparison to the usual practice, and it is also unavoidably linked to the territory and temporally defined. Therefore, tourism is about traveling to reside in places outside a usual environment for short periods of time, however the purposes for tourists can be various. Not only pastime but it is motivated by reasons of health, leisure and even business, it

represents one of the major business of Cities and Countries, contributing to their image (Tornatora & Amaro, 2019). It allows to experience and to know new, varied and different realities.

Tourism has deep historical roots and a long history. It assumed economic connotations since the end of the XIX century and a mass dimension in the sixties (Bellini & Pasquinelli, 2017), often meaning a reduction of the knowledge to a simple information. As mass tourism, it has been described as *hit and go*, where the local identities vanish due to the process of globalization. A merchandized tourism able to transport large numbers of people in a relative short time span to distant parts of the planet, but not able to ensure the right quality level of knowledge experience.

Just in more recent times new tourism paradigms have emerged, more attentive and sensitive to environmental sustainability, cultural and socio-economic conditions of places of destination. We are witnessing the increasing interest of tourists in heterogeneous contexts, which successfully combine the tourist practice, creativity, subjectivity, the spontaneity of places and non-traditional sectors such as food, craftsmanship, sport, subcultures, music, art, productive and rural industries (Richards, 2011). A new desire to see, even thanks to the new technologies, pose new questions about the sense of places and visit, mixing more and more real or imaginary knowledge of a destination; tangible and intangible experience. A city, in this process, becomes a 'places of the mind' and its visit is not just a roster of places and cities, structured by tourist guides which impose things to see into the places and cities – buildings, artworks, environmental – forgetting about many others. It is a personal and shimmering collage of tips, information and suggestions offered by different sources such as book guides, websites, blog, friends, locals and other tourists experiences. The role of the tourist changed, having the opportunity to an active protagonist and planner of his/her own itinerary. The idea of personalization and the possibility to feel part of a place become components worthy of consideration when designing experiences.

3. How can technologies support our urban visit experience?

Technological advances and digital transformation are deeply influencing our lives, impacting our habits and uses, as well as on how we perceive our surroundings (Castells, 2000). Since they simplify our everyday life and our tasks, we are used and often even addicted to a technology that provides answers to our needs, while creating them (McLuhan, 1964). Expanding this point, we can say that we witnessed a change of role: technology quickly shifted from being oriented to problem-solving to satisfying or raising needs (Hassenzahl & Tractinsky, 2006). Embracing a user-centered perspective, technological changes made the access to information diffused and smooth, broadly reframing our literacies (Jenkins, 2006).

Mobile technology and location-based services are an excellent novel opportunity for cities and their cultural institutions to reach a wider audience (Proctor, 2011) and to enhance

traditional cultural consumption. Technology, whether one likes it or not, is becoming ever-present in our everyday life and they are gradually causing changes in daily habits. It multiplies the possibilities of reading, interpreting and participating the cultural asset. Technology offers new urban narratives (Trocchianesi, 2018). This seems particularly true in the context of tourism, where digital has more and more become strong support of the tourist experience.

According to Gartner (2010), in last years people have been accessed the internet mainly through mobile technology since *"*today's tourists are now a large percent digital native, born and bred in virtual worlds*"* image (Clay & Ruth, 2019, p.144). The location-aware systems are able to provide additional information, give directions, and customize the offer, delivering therefore an individualized content, and thus enhancing the tourist's experience according to his/her personal and particular interests. Mobile devices are changing the way people enter in contact with the city knowledge, its habits, and culture. These technologies enable turists to connect with others, search data, and create personal and shareable contents (Gammon, 2008; Burch, 2008).

> "The capability to add social engagement is a chance to involve communities with a different active approach in generating cultural contents. Digital resources are a great opportunity to connect anytime and anywhere allowing online interaction; multiple tasks could be performed quickly and easily allowing a deeper understanding of a subject, works of art, and cultural heritage in general" (Ceconello, 2012, p. 1)

Therefore, the tourism success of a city *"*will depend solely on their abilities to communicate their real as well as their virtual offerings properly to the public*"* (Clay & Ruth, 2019, p.144) and the current situation opens up space for change and innovation. The city's information conveyed through the web has greater impact to tourists' choices. Technological and mobile devices support tourists-visitors at all stages of the journey: organization, arrival, planning of activities and return home, as regards the demand, needs or wishes. Social networks allowed a direct and easy access to useful information for the visit. Moreover, as mentioned above and according to some studies, travelers tend to rely more on information received by other tourists rather than those supplied by tour operators; since direct experiences are considered as a guarantee of neutrality and truthfulness of judgment and not conditioned by particular interest (Spasiano, 2016). Tourism therefore produces and unearths new social rituals to which it is possible to adhere and belong (Cipolletti, 2014).

4. A multimedia living room for newcomers, travellers and city users

Design today faces complex problems and situations. It has a holistic approach (Buchanan, 1992), and therefore, more and more seemingly separate areas of intervention are overlapping and intersecting. Design is changing from a single craft-oriented discipline into

one that is more robust and multidisciplinary, connected with social environments, products, services, systems and brands (Friedman, 2002; Muratovski, 2010). Disciplines such as the design of spaces and services often require interactions in the various stages of the project. Service Design, which always combines the design of tangible and intangible aspects (Meroni & Sangiorgi, 2011), in a hyper-connected, digital and ephemeral world like ours, needs more and more tangible, secure, stable, and physical aspects.

In this essay we introduce a spatial and service project, the YesMilano Tourism Space, designed to welcome tourists and citizens in an environment where analog and digital technology meet creating a multi-sensory experience.

The project's proposal has been started from a scientific agreement between the Chamber of commerce of Milan, Monza Brianza Lodi and Politecnico di Milano, Design Department. The project's aim was to work with a shared approach between these two public institutions and dealing with the need of the Chamber of commerce to design an innovative experiencing space, giving a prospective of an engaging place for tourists arriving in the City of Milan. The space, that opened in December 2018, is an emblematic and strategic project not only for the Chamber of commerce but also for the city of Milan. It's located in a historical building in the city center, Palazzo Giureconsulti in Piazza dei Mercanti, and due to the importance of the building, its architectonical and cultural heritage, several figures have been involved during the research process such as the Superintendence of Cultural Heritage of Milano, that supervised and validated the project.

Which are the needs in a City we don't know anything about yet? Which services do we make use? Are there any aids that can promote our experience and increase the link with the living spaces, usually taken for granted? Every one of us has been a newcomer, tourist o more in general traveler in life. These are the questions which guided the action research process (Muratovski, 2010) and designers into the realization of the space.

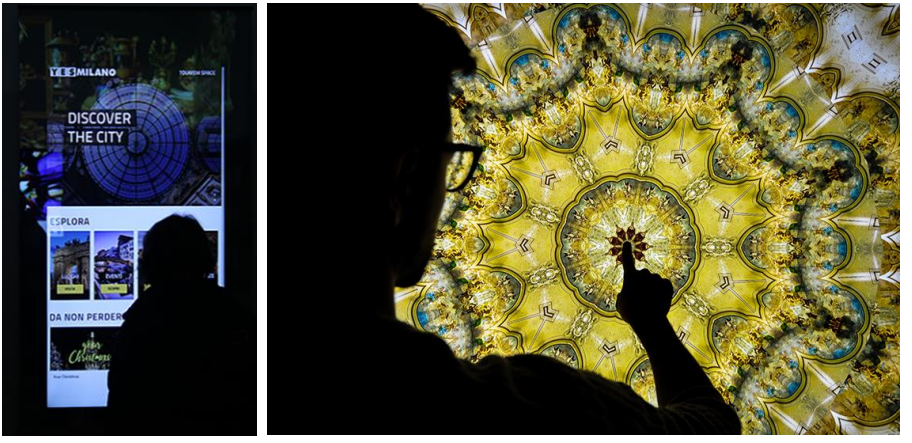

Figure 1-2. Two touch-screen mirrors guide and a big interactive monitor, like a hanging picture, welcomes the visitor with colorful and changing patterns.

Enabling narratives through new technologies stratification is a "model which involves the citizen, the tourist and the city user in an immersive experience; it asks for their active participation and aesthetic, cultural and playful involvement" including "screen-facades that became multimedia metaphors of explicit (visible on/in buildings) and implicit (as augmented reality by tag, app, QR code and so on) narratives". (Trocchianesi, 2018, p.140)

The space, as result of a multidisciplinary approach, is configured with a high dualism between analogic and digital: two touch-screen mirrors guide to the discovery of a hothouse filled with ideas for tourists in the city (fig. 1), they reflect the richness of the environment, expanding it and playing with the filtering lights from the large glass surfaces, when activated by human presence, they turn into display surfaces and reveal dedicated visual stories; a big interactive monitor, like a hanging picture, welcomes the tourist with colorful and changing patterns (fig. 2). Starting from the images of the city and its surroundings, the tourist is called to recreate new visual configurations and chromatic blends. By selecting a tourist route and / or photograph of interest, it is able to transfigure it while maintaining the starting polychrome DNA. The combinations are infinite and can be turned into a gift as a souvenir of the experiences to be sent by email.

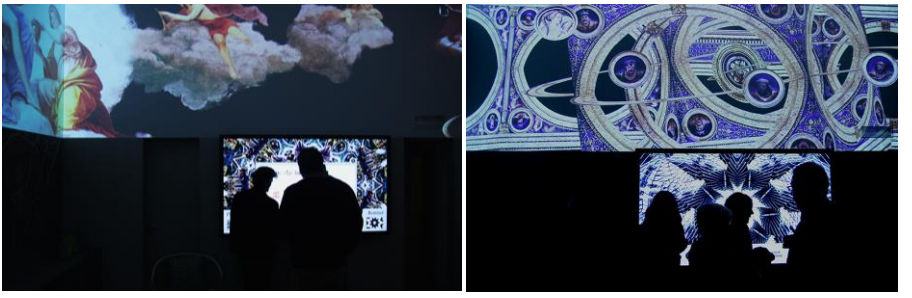

Figure 3-4. Images of the space during the night: magic lantern changing the projections on the inner walls.

In the evening, once the space is closed, the YesMilano Tourism Space turns into a multimedia magic lantern (fig. 3-4) changing the projections on the inner walls as well, just touching the skin of a window from outside (fig. 5-6), projections created ad hoc permeate the ceiling and walls, showing through the large glass surfaces. They invite the passer-by to interact with the transparent skin of the historic building. With a touch the contents can change, offering the possibility of sensorial immersion in a new dimension of knowledge and experience. In this sense, the accessibility which denotes that these spaces are open to all, should be understood as permeability, being able to "enter a space" without hesitation and effort. (Poot et al., 2015).

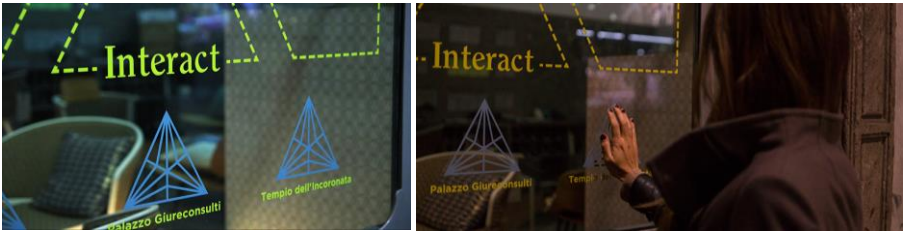

Figure 5-6: Interactive outside skin windows.

A stylized map of the City suggests itineraries to follow and is flexible and passable to analogue interaction. The tourist can in turn propose itineraries for visiting the city, through the playful and analogical use of colored threads.

YesMilano Tourism Space turns into the living room of today's tourist and citizen, a warm environment, with a strong visual character, equipped with tapestries, custom-made wooden furniture and design objects (Bollati & Collina, 2020). The domestic atmosphere welcomes the tourist and invites him to digital and non-digital interaction. Some other partners took part in the project like publishers, furniture brands and cultural institutions present in the city.

Figure 7-8: General overview of the YesMilano Tourism Space.

5. Design as a trigger of experience

> "The great struggle of travelers used to be to know the facts of the countries they travelled through. Nowadays, our phones have made factual knowledge ubiquitous and unhelpfully overwhelming. What we need isn't ever more facts, but experiences that are curated in accordance with our own inner needs" (De Botton, 2013, cited by Cipolletti, 2014, p.93).

The purpose, providing different stages of the project process, is to demonstrate how Design can be a *Trigger of experience*, *Osmotic-membrane Interface*, *Know-how* provider and *Social engager*; how Digital has become strong support of the tourist experience, activating fields of dialogue with more and more heterogeneous connotations? The project yearns, starting from existing processes, forms and case studies, a systematization in innovative models, feeding theoretical reflections with an empirical experience.

Some of the most recent technological transformations are inherently linked to the way in which communication advanced and evolved through time. Communication is nowadays more and more diffused, constant and global than ever before, and it happens between people, people and objects, but also among objects themselves (Evans, 2011; Evans, 2012).

Moreover, it is featured by the overlap and commixture of what we were used to consider polarities: the boundaries between tangible and intangible, hardware and software, private and public are indeed blurring (Loukides & Bruner, 2014). Users are the starting point of Design, and Human Centered Design in particular. The analysis of their habits, gestures, rituals, needs, and aspirations plays a key role in the design process, since it allows designers to conceive modern solutions and proposals that combine digital and physical aspects in an aesthetic context. Contemporaneity sees a designer who can manipulate novel sensitive objects that become active subjects according to the way in which their behaviors are engineered and programmed within a digital and physical design schedule. Knowing how to manage sequences of contents, being sensitive towards graphic trends, their communicative effects, the behaviors they suggest and how the different objects on stage interact and dialogue as part of a complex system, requires designing contemporary artefacts and systems assembling a multiplicity of fragments in order to obtain a unitary set of meaning.

The programmatic function of this practice invokes a user-centered approach capable of precisely imagining the experience of fruition. In fact, it is relevant to note that at the center of the process of designing interactivity there is interaction rather than interface (Montefusco, 1992).

Inside *Yes Milano Tourism Space*, the technological equipment is not displayed, but its effects are felt. The technological presence, in terms of device machines, is reduced, increasing the "sensitivity of the environment". The space is not complicated with technology. The technical components are not highlighted. The emphasis is, instead, on the technological consequence and interaction results. The analyzed project is based on the use of "natural interfaces", interactive systems which react "without the use of technological intermediaries but through traditional methods of communication" (Cirifino et al., 2011). This fact is also supported by the growing attention that is drawn on researching the user and his/her practices (Kuniavsky, 2003), natural behaviors and needs, when developing complex spontaneous systems.

Moreover, the project follows the direction of an aesthetic that includes variation and dynamicity, as well as on contents that imply stratification and the possibility of reconfiguring themselves over time (Manovich, 2011). The space is therefore designed in narrative way. It allows not only an informative experience but even an evocative one. Each tourist is able to recombine the provided contents and information in a completely personal way. The result is different touchpoints with which the tourist can relate at different levels and at different times, when experiencing the city.

Between accelerations and interruptions, the ongoing digital evolution is reshaping users' habits (Turkle, 2011), deeply affecting design processes. Designing contemporary systems means indeed dealing with a technology that surrounds us, being almost omnipresent and increasingly pervasive (Kuniavski, 2010), but also human. Looking at being enabling and accessible, technology is aimed at making contemporary services increasingly smart, using sensors (embedded technology), network connectivity, and the power of data computing (Anderson, 2012) for improving users' daily life. Considering how electronics and information technology can be enabling, pervasive and accessible, as designers we are more and more inclined, but also encouraged, to imagine smarter and hybrid experiences that are articulated between physical and digital dimensions (Ishii et al., 2015; Krishna, 2015), consequently influencing users' behaviors and habits. Especially the trend of embedding technology triggered the desire to experiment and design UX experiences where the distance between the user and technology as "the artifact" is reduced and made inherently seamless.

6. Conclusions

In this essay, Design enhances technology, assists in making it accessible and increases the value of learning and emotional experience. Design involves also human dimensions,

sometimes ephemeral. Thanks to the use of *natural user interfaces* (Cirifino et al., 2011), it can combine *Technology* (tools) with *Art* (language) and *Territory* (substance); novelty and familiarity (Bianchi, 2014) as well as new and traditional forms of communication, the emotion of surprise and the importance of feeling comfortable. A final output of the project is also to be able to reflect starting from a specific context, an abstraction of replicable approaches able to face several fields of interest.

If tourism is to be considered a system of relations between people and places, between people themselves as socializing subjects in contexts where the tourist practice is possible, and between the individual, their experiences and desires, then the specific organization of a site may be responsible for producing and suggesting the separation or involvement of the interrelating elements. The study of these relations makes it possible to understand the articulation and consistency of a tourism space, in regard to the quality and roothold of spaces with respect to the existing fabric, with significant effects on the rhythm of cohesion and upheaval of places, in contexts of day-to-day life.

Placemaking through Creative Practice: Enabling Change and Empowering Future Change-makers

Abstract | Toronto, Canada experiences both the benefits and challenges that come with rapid urban growth. Challenges include increased racial and economic inequities; lack of affordable housing; loss of community space in redevelopment, and marginalization of citizen voices across planning processes. There is a zeitgeist of Toronto as an emerging world class city based on economic, cultural, and environmental qualities, yet it struggles to ensure inclusion, access, and social justice for all its citizens. Design Manifesto 2020 (DM2020) explores community-driven placemaking across the metropolitan area as it gathers stories of lived-experience in creating spaces and places. How can we learn from successful local initiatives to foster creative solutions elsewhere and further, how can we impart the process of community engagement as an ethical tenet of design praxis and pedagogy? This paper takes a mid-project look at the narrative inquiry process of storytelling and its potential for greater inclusive community-based placemaking.

KEYWORDS | COMMUNITY PLACEMAKING, NARRATIVE INQUIRY,
INCLUSIVE DESIGN, DESIGN ACTIVISM, DESIGN PEDAGOGY

1. Introduction

> "As both an overarching idea and hands-on approach for improving a neighborhood …placemaking inspires people to collectively reimagine public spaces as the heart of every community" (Project for Public Space, 2020).

Placemaking is a collaborative and powerful tool for community-building. It can be driven top-down by politicians seeking broad development goals, or bottom-up with grassroot activism in fostering ad hoc solutions. At the core is the value-added concept of employing a community's strengths and aspirations to reflect its unique identity in shaping the public realm (Stewart, 2018). The US-based non-profit Project for Public Space (PPS) implements placemaking by animating the public sphere, positing that systemic neglect of places leading to marginalization of neighbourhoods demands *systemic change* through locally driven transformations (Project for Public Spaces, 2020).

In Toronto, neighbourhoods are experiencing the negative aspects of large-scale urbanization. Indigenous, Black, Youth, LGBTQ2S, Newcomers and other strong communities want a greater say in planning their communal spaces. Historically left out of mainstream planning discourse, the communities have also been systemically ignored by sectors developing and influencing city building processes. The result is a list of exclusions including forgotten densities, lack of affordability among other lived realities (Pitter, 2020). Toronto Foundation's Fallout Report (2020) on COVID-19 states the virus creates an even greater risk with challenges in respect to health services, food security, employment and stable housing (Ayer, 2020. p.9). Robust placemaking policies and plans based on community need, immediate and longer-term, will need greater 'resilience' for existing and new challenges to come.

Figure 1. View of Toronto from western edge of Greater Toronto Area and Lake Ontario. Image highlights the city shoreline, the renown CN Tower and built-up downtown core with offices and condominium towers.

Toronto (figure 1) is awakening to its role in decolonization, and reconciliation with Indigenous communities amid a national call for nation-to-nation dialogue.

The city is learning Indigenous principles of placemaking among many other first nations' cultural and creative practices. Urban Indigenous youth are emerging place makers engaging ancestral knowledge for 'connection to place' (Hood, 2017). It is a poignant moment to understand how connection to a place has meaning for communities seeking equitable opportunities to participate in growth. Design Manifesto (DM2020) considered this opportunity in developing its research project for capturing how Toronto's six historical boroughs are faring with community-based placemaking and with a view of sharing the collected placemaking stories back to the city. The two-year research project was launched in January 2019 as part of the annual Toronto DesignTO event with a public forum at OCAD University. After the city amalgamated in 1998 to become a single municipality of Metropolitan Toronto, there remain six geographic regions based on the prior boroughs of Toronto, East York, York, Scarborough, North York and Etobicoke (Toronto.ca). The initial framework for listening to citizen stories for the design of community space was based on these geo-political boundaries but has since shifted to a framework for learning about the critical economic and social boundaries that actually influence or impede community placemaking. Over the last decade, three distinct economic boundaries (figure 2) as reported by Hulchanski (2007) have now emerged, and these have a profound effect on community placemaking success.

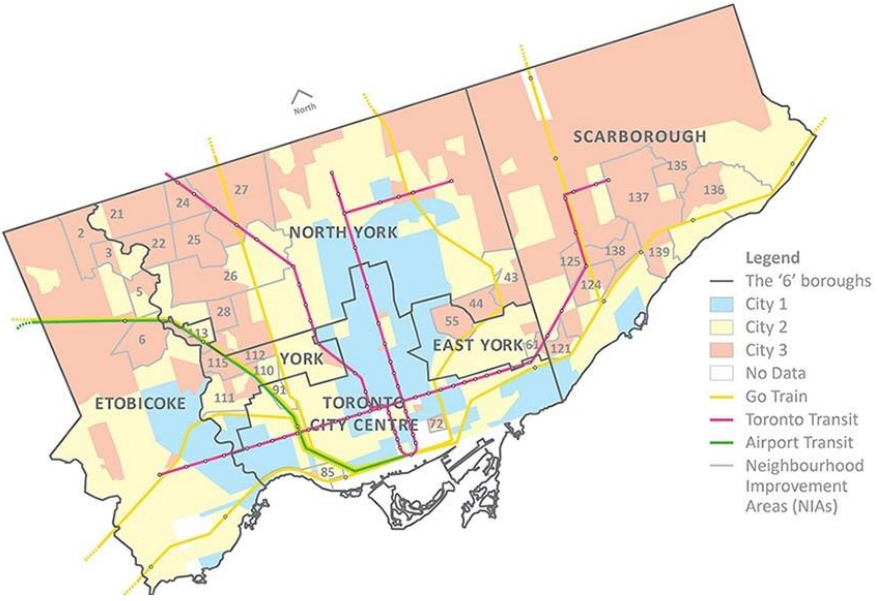

Figure 2. Map of Toronto showing six former municipal boroughs, three emerging economic cities, and an ineffectual transit system which isolates much of Toronto's population from the city centre.

City #1 has the wealthiest neighbourhoods (Toronto, Downtown) and City #3 comprises west (Etobicoke), east (Scarborough), and north (North York) regions supporting the fastest growing number of newcomers with 50% of overall city population. These larger areas include a car-oriented middle-class, less efficient public transit, and densification of older neighbourhoods. City #2 surrounds the downtown (includes York, Mid-Town, and East York) where the once middle class and upwardly mobile is now splitting into either City #1, or #3. As a result, Toronto, while more diverse, has also become more economically divided (Hulchanski, 2007, p.2). Expensive high-rise developments engulf central and mid-Toronto neighbourhoods. These have been isolating older social housing communities and the research has heard from residents concerned for falling behind the urbanization curve. The new realities of Covid-19 pandemic and other challenges yet to come highlight that community-based placemaking matters, if only to confirm community identity and reinforce 'connection to place'.

2. A framework of inclusive storytelling

DM2020 is collecting personal stories in order to respectfully capture citizens' account of their own lived realities in placemaking. This data collection method of narrative inquiry leads to disccourse analysis (Gray, 2018). Stories of local placemaking actions are positioned in the research as *case-stories*. Participant storytelling also contributes to a broader discussion about community-building that generates collaborative responses to issues of the day. In forums and workshops both in person and online, case-stories, and the co-created outcomes of community events become the 'research findings'. The qualitative data collection will ideally evolve a set of community informed planning tools for placemaking applications, and for design pedagogy and practice. In its second year, DM2020 continues to apply the narrative inquiry method and has welcomed over 100 citizens to date with seniors, students, art practitioners, community animators, and design activists sharing their experiences with placemaking across Toronto (figure 3).

The project also aims to understand participatory action research (PAR) and participatory design in utilizing storytelling as a generator for social change discourse. Participatory processes are not new, they have been the key approaches for design of technology, products, services and space. However, lessons learned from the collaborative approach with stakeholders or 'end-users' seem to be lagging in design industry practices, particularly in real estate development according to communities contributing to the research. They continue to ask why local voices are not registering in the final design of spaces that affect their daily lives?

Figure 3. DM2020 Forum-East Scarborough Storefront. Community shares ideas and goals for placemaking with written and drawn ideas, sharing of stories, and group discussions.

Figure 4. Danforth Village Laneway Project. Changing an alley of neglected garages into canvases for mural artists. Photo courtesy of Bruce Reeve (2018).

Community placemaking in Toronto as elsewhere can result in ad hoc interventions for the empty niches in the urban fabric, or forgotten parks and thoroughfares. These are sometimes born out of frustration when neighbourhoods are neglected by authorities in managing public space. The solutions raise new questions for research:

1. What ad hoc solutions get city support?
2. What actions disrupt planning processes and lead to shifts in practice?
3. Do community projects need both public-private partnerships to be sustainable?
4. How do local projects foster greater equity in serving communities affected by systemic exclusion?
5. Is beautification a necessary first step in addressing neglected urban space (figure 4)?

Once analysed, case-stories gathered may help to answer these questions, and potentially guide creative actions across other urban contexts.

Participants invited to DM2020 events require two conditions: space (analogue and/or digital) for story sharing as 'expert witnesses' to their day-to-day experience (Lupton, 2017. p.32). Second, an audience willing to respectfully listen. Engaged interaction is not always assured and each forum results in various storytelling dynamics. Respectful listening empowers those sharing the stories with an understanding that shared knowledge will matter in making change happen and in better ways. Arendt's seminal work The Human Condition identified that we are both affected by and effecting the world we create (Arendt, 1998). Identifying how the public realm can be more functional, accessible, liberating-communities strengthen connection to place equally as they establish their place in it. Shared experience stands as collective expertise for how to get things done and critically, for what should not be done again. Developers, governments and designers need to commit to leveraging community lived experience in shifting *'design for'* to *'design with'* people.

3. Participation in placemaking

The model of participation, well-established as civic engagement, gained both political and social traction with civil rights movements and civic activism in the mid-last century (Schneekloth & Shibley, 1995) but shifted towards the more practical approach for citizen engagement in planning new, or redeveloping older neighbourhoods in the 1990's:

> "…one that no longer viewed participation as 'citizen power.' The purposes of participation have been more modestly defined for information exchange, resolving conflicts, and to supplement the design/planning [processes]" (Sanoff, 2017, pp 9–10).

Participatory design, positioned as front-end activity in planning, requires community contribution and power sharing for effective decision-making. To achieve sustainable and long-lasting outcomes community action at front end of development, during

implementation, and inportantly, at post-occupancy stages are needed. In this way, lived-experience can be validated as critical design knowledge. Community redevelopment rarely gets design feedback except through a maintenance complaints process.

Two decades into the 21st century, the participatory process is seemingly shifting from advocacy back to activism. In the North American context, it now responds to even greater racial injustices and economic disparities, with global pandemics and climate change posing further challenges. However, community voices will no longer be 'silent' (Cole, 2020). As large urban centres like Toronto brace for new urban growth, the resulting disruption will further marginalize established neighbourhoods excluded from planning decisions. Diverse, insightful Toronto voices like Desmond Cole, author and activist, and Jay Pitter, award-winning urban planner and place maker are affecting social and material change through participatory placemaking. Pitter is spearheading city-building projects for greater equitable public spaces in what she terms as 'healing fraught sites' (Pitter, 2020).

Genuine participation occurs when communities are "empowered to control both the agenda and the action" (Sanoff, 2017, p.8).

The Arts have a unique role in shaping public space, in ways that few disciplines can. DM2020 has revealed this to be particularly true for youth artists trying to make a difference by animating neighbourhoods that speak to their identity. Artmaking commands placemaking platforms including building facades, community centres, streetscapes, and digital space (Luger & Ren, 2017). A graduate in community development shared their story of trying to make a difference by bridging the gap between youth and powerful institutions. Taking jobs at various agencies including Parks and Recreation, the storyteller came to understand that major organizations were 'hostile' to urban youth—viewing them as potential 'problems' to be avoided, and discouraging their access to public space. It was clear that change was harder to achieve from *inside* the establishment where the storyteller felt their individual power systemically dismantled. As a result, the storyteller now opens up their home for creative gatherings with music, poetry readings…thereby making a welcoming space for youth to connect around the arts without fear of stigmatization and judgement. The arts drive both a discourse about the larger public realm, and equally foster moments of intimate placemaking where communities would not otherwise have a venue for creative expression. Case-stories gathered show meaningful placemaking happens by people desiring places that hold their creative dreams. This is a key distinction from placemaking driven by large entities, or top down by politicians with self-serving notions of planning legacies.

Grassroots placemaking can occur in both expected and unexpected ways. In 1995 Toronto got its first outdoor public bake oven and more have sprung up across public commons, offering ways for neighbourhood celebration. A guest place maker at the inaugural DM2020 event lives in one of Toronto's 31 Neighbourhood Improvement Areas (figure 2). Disappointed in the neglected state of their local park (a space lacking in minimal garbage collection), they began the task of improving the neighbourhood with a welcoming place for

residents to gather. The need was not for another ‘bake oven’, but for a Tandoori Oven, as this better reflected the cultural make-up of the community. In revitalizing the park so too was the community revitalized, and surrounding neighbourhood treated to a diverse perspective on food. The park has become a hub for community markets, another of this place maker’s many accomplishments.

Asking who holds city power and how it might be shared is a good way to start a community development conversation and avoid, what Dave Meslin terms ‘intentional or designed exclusion’. Meslin, a self-proclaimed ‘professional rabble-rouser’ actively involved in challenging Toronto’s politics, joined the project launch as a guest panellist (figure 5). He characterizes the city’s planning invitations to the public as an example of designed exclusion. In his Ted Talk “The Antidote to Apathy” he speaks to how cities ‘discourage engagement’, using a typical City Hall Notice of Zoning Application as an example. Ads placed in local newspapers invite the public to information sessions about new building developments. The dense text on the half-page ads is ‘impossible to read’ and all pertinent information on how to attend meetings is buried at the bottom in small font or typeface. This, says Meslin, is an example of intentional participatory exclusion (Meslin, 2010).

Figure 5. DM2020 launch at DesignTO 2019. Panellists left to right: community activist, Dave Meslin; Chair, Thorncliffe Park Women’s Committee, Sabina Ali; Toronto City Councillor and panel lead, Kristyn Wong-Tam; Public art critic, Spacing Magazine, Sarah Ratzlaff; Manager, Centre for Connected Communities, Ajeev Bhatia. Neighbourhoods are keenly aware of their political capital in the approvals process. Planning proposals have been thwarted because of concerns raised by residents. The reimagined aim of the participatory design process is to put community and resident voices on par with centres of control in decision-making and to avoid potential confrontation in advance of approvals processes. “This must be done very early on in the process in order to contribute and lead the preliminary development design ideas” (Ratti, 2015, p.17).

For Indigenous urban communities there remains as architect Calvin Brook’s states ‘… so little in the fabric of the city that acknowledges them” (Hood, 2017, p 48). New placemaking councils, local visioning exercises, and reinforcement of indigenous identity across the city of Toronto are being planned with the aim to respect indigenous knowledge in the development of spaces for gathering, storysharing, and cultural exchange (Hood, 2017, p.49). Community leadership in urban design is a means to accomplish buy-in for social change as new developments and revitalization become fully realized, but it must be given both respect and power to be effective.

There are success stories for projects undertaken with community engagement across Toronto that counter the many developments lacking in critical community-based placemaking needed for sustaining ‘connection to place’. A well-documented example is Toronto’s St. Lawrence Neighbourhood—a tri-level government partnership under what was then new housing policies of 1970’s that remains a model for engaged participatory design (Sewell & Jacobs, 1993). Recent revitalization projects for older social housing complexes are working with a mixed income solution and added social value in the form of new cultural and recreational facilities. This aims to bring greater diversity of land use and people together for stronger economic viability and increased standard of living. Regent Park (2009–present) redevelopment (figures 6–8) is such a case, however, the outcomes of these development models are not fully known (Moos et al, 2018). Given that communities were already highly mixed, revitalization projects may result in less diversity by reducing affordability; displacing long-time residents and newcomers, or by making gentrification attractive to upwardly mobile dwellers in ways that further exclude prior communities.

Figures 6, 7, 8. Regent Park, Toronto's renown 69-acre public housing project, isolated the neighbourhood from main streets. Above shows a collection of images for regent Park-an apartment tower being torn down during revitalization, a public art installation, and the replacement mixed-use facility along Dundas Street East. 4. Role of the creative practitioner: A work in progress

Citizens aim to make change happen without formal processes but can run afoul of planning authorities. The planner-designer, historically delegated to facilitate community engagement, present their projects in methods that will foster approvals and expedite implementation. Bearing the mantle of best-educated in theory and practice, they interpret people's needs and manage their expectations (Sanoff, 2017). Vital in making formal placemaking happen, they are also groomed for this leadership (Ratti & Claudel, 2015). Le Corbusier's 'urbanisme' expressed in la ville contemporaine of 1922 was a colonial planning vision for eradication of 'urban blight' with 'systemic development' to improve a citizen's quality and standard of living, all aimed to house the masses of future urbanites (Guiton, 1981). The ultimate orchestration of such a creative vision would fall upon the conductor—the architect. The designer's 'creative vision' on behalf of the community remains strong to this day (Ratti & Claudel, 2015). A discussion should be formed around how designers shift from interpreter of communities needs to facilitator of inclusive design processes that aligns both development and community goals. DM2020 research partner Bryan C. Lee Jr, co-founder and design principal at Colloqate, a design justice firm based in New Orleans, USA fosters inclusive design of places to ensure racial, social, and cultural justice. Colloqate state that "For every injustice there is an architecture built [to] sustain and perpetuate it" (Colloqate, n.d.). Bryan inspires young design professionals to collaborate with social change makers in community orchestrated solutions for mitigating systemic exclusion.

> "Injustice and inequity manifest relative to their respective contexts. We are attempting to grow the Design Justice field through organizing students, academic theory, and community collaboration." –Bryan C. Lee, AIA (Colloqate, 2020).

Colloqate is shifting the designer's role from 'conductor' to community collaborator in driving planning and design of urban space.

In respect of the art, the City of Toronto's Planning division implemented a 'Percent for Public Art Program' in 1985, which secures one percent of gross construction costs for any new development towards public art. These guidelines ensure the program is applied in a consistent and informed manner citywide while controlling where and how it is manifested (Toronto, 2010, p.13). In this context, the arts practitioner can become an interpreter of planning aspirations, managing community expectations, while the community remains an 'end-user' rather than a co-creator. When the arts partner with endowed agencies to become "cross-sectoral intergovernmental partnerships for placemaking" (Zitcer, 2018, p.2), the impetus becomes how to attract visitors and investors rather than support grassroots placemaking through art practice (Eisinger, 2000, p. 322).

Across Toronto, from City # 1 to City # 3 there is an exponential rise in mixed-use tower development with the welcomed percentage of programmed art, but in what had been smaller scale, community-focused neighbourhoods (Nasser, 2019). Determining who is included and excluded from decision-making processes is an ethical act: "Those involved select and exclude aims and boundaries for any project; privilege ways of working at the expense of alternative methods" (Schneekloth & Shibley, 1995, p.13).

An outcome of exclusion in decision-making is not only the loss of creative alternative ideas, but disempowerment for those left out. Gentrification, positioned for economic and cultural revitalization and implemented under the guise of eradicating 'urban blight', assumes that where and how people live should be measured against economics and investment in urban growth. The planner, designer and artist remain the creative interpreters for development, caught between client/owner, builder, authorities, and the 'end-user' (Ratti & Claudel, 2015). The process still begs the question, for whom does all this benefit?

5. The young are alright: Empowering new voices

> "Forgive no error you recognize. It will repeat itself, increase, and afterwards our pupils will not forgive in us what we forgave" (Yevtushenko, 1952).

As DM2020 continues into 2021 it becomes clear that younger voices for placemaking are determined to not only be heard, but to effect change. The project is learning how co-creating places with young place makers are vital for their survival. Interventions that humanize and animate forgotten urban areas buffer planned revitalization that sanitize and designs away spontaneous acts of placemaking. Case-stories identify how to make things happen at the margins of an expanding city. An example of a grassroot intervention for and

by youth is “Behind the Line”, founded by Artist Amir Akbari. The organization works with local businesses and community groups to develop creative programs and art projects that engage youth in challenging perceptions, raising awareness, and beautifying communities left behind as new development surrounds their neighbourhoods. Street art fosters spontaneous dialogue with passers-by, allowing nascent artists to share their work and stories, strengthening a community’s connection to place by the act of making art (figure 9).

Figure 9. Mural art by Behind the Line, a grassroots Toronto organization working with building owners to engage youth in creative practice and community-building.

The collected case-stories are growing in volume-informing opportunities for pedagogy at the post-secondary level. Social justice practitioners including Jay Wall of Rally Rally (Toronto) and Bryan C. Lee Jr of Colloqate (New Orleans), support the project’s push for NextGen practitioners to be more ethically and socially responsible when working on projects that aim to support communities. At a recent DM2020 design activism workshop (figures 11 to 14) facilitated by Colloqate, youth were asked to identify issues that emerge from shared knowledge in order to generate solutions to address the lack of empowerment in city planning. Access to, and quality of public space; weak intergenerational programming; and minimal resources to support education, and foster creative endeavours were the key issues identified. A recurring theme was the lack of respect displayed by those with privilege who control city finances, and social and recreational programs that impact youth.

Clockwise from top: Founder, Black Futures Now Toronto, Adwoa Afful speaks about her work with anti-oppressive placemaking practices; Sticky Note exercise to help get to know one another; Brainstorming placemaking ideas; Founder, Rally Rally, Jay Wall share posters he and a participant created to raise awareness about pedestrian and cycling deaths in Toronto. Photos by: Nick Sagar, 2020.

6. Conclusions

DM2020 set out to engage, listen to, and learn from diverse citizens across the six regions of Toronto, and as the project progresses, it is listening more intently to NextGen voices and the social and economic issues that diminish their neighbourhoods. An online discussion is being organized due to safe distancing measures that will pair DM2020 with a youth mentorship group from north west Toronto. The event will seek to learn how this community has fared during the pandemic and explore their placemaking efforts for community-building and economic stability. Engaging youth in narrative inquiry as part of both formal and informal learning is how DM2020 welcomes and respects youth

perspectives. Their lived experience is a catalyst for raising social awareness and fostering inclusive placemaking solutions for communities where they live, work, and play.

During tremendous urban growth, city governments are under pressure to implement expedient solutions. The collaborative placemaking model requires patience—a potential enemy of bottom-line outcomes. Diverse community voices, including voices of the very young, however challenging to hear for those of privilege and power, are important to inform, guide, and build upon, as 'lessons learned' that should not be repeated. Places also take time to develop and evaluate. The measure of success for a place should be gaged for equity and inclusion, including the humanistic qualities it supports and the respect it offers communities. To achieve this, it is necessary to have confidence in citizens' capacity to conceptualize the design of places that reflect their collective need and creative dreams. Jane Jacobs, long time Toronto resident, acclaimed author and renown urbanist famously stated in her 1950's Fortune article "There is no logic that can be superimposed on the city; people make it, and it is to them, not buildings, that we must fit our plans" (Fortune Classic, 2011).

Outcomes of DM2020 intend to highlight the 'lessons learned' from many case-stories gathered for transforming forgotten neighbourhood spaces into vibrant expressions of community identity. The creative artefacts of the work are yet to be fully realized, but the design of a shared-knowledge community planning toolkit, a checklist, or a roster of local-based solutions for inclusive placemaking are all under consideration.

Proximity as space of opportunity: connecting people, productions and territories

Valentina Gianfrate*, Elena Formia, Flaviano Celaschi, Elena Vai

Department of Architecture, University of Bologna, Italy
*valentina.gianfrate@unibo.it

Abstract | The paper presents the work of the Advanced Design Research Unit (ADU), currently involved in the experimentation of new services and products, able to face territorial issues coupling a proximity approach with a global perspective, contributing locally to the achievement of SDGs of EU Agenda 2030. This approach applied to the research and educational fields allow designing new solutions for local/global challenges (new flows of people, light reindustrialization, urban voids emergency, resources' scarcity) in more imaginative, inclusive and sustainable ways. ADU learning and research structure is based on a quadruple helix approach to connect R&I, enterprises, PAs and communities. The synergies between design education and the productive environment of the Emilia-Romagna Region is strengthened by the launch of the new Research Center for Interaction with Cultural and Creative Industries, to define research lines and open design perspectives oriented to guide the dynamics of a responsible and cross-sectorial society.

KEYWORDS | PROXIMITY APPROACH, PRODUCTION&TERRITORIES, RELATIONAL SPACES, SDGS, FRAGILITY FACTORS

1. Introduction and General Framework

The controversial relationship between design and cities is receiving great attention at an international level. This is due to external factors related to an interdisciplinary debate, but also to internal factors that deal with the design discipline itself.

In the recent past, the concepts of city and territory have profoundly changed. The idea of uniformity and identity in urban transformations has been superseded by a wider debate that involves many disciplinary fields, stakeholders, actors. The concepts of knowledge cities (Carrillo, 2004), intelligent cities (Komninos, 2002), innovative cities (Simmie, 2001), creative cities (Florida, 2003; Landry, 2000), and media cities (Mould, 2014) have been adopted to some extent as strategic visions for urban development. This happened in the same moment in which urban policies assumes a new perspective on knowledge-intensive industries, incorporating creative and cultural industries concept, which emerged as a promising growth sector with a strong urban orientation (Mould, 2014) and a tangible relation with the experience and transformative society.

On the other side, as previously mentioned, the design discipline itself has started to look at the urban dimension with different eyes, no longer only regarding its final form but the ways and processes through which cities and territories are intentionally transformed continuously. Earlier signs of this discourse date back to the 1960s, with great repercussion on the disciplinary debate. The writer and activist Jane Jacobs, in her seminal book *The Death and Life of Great American Cities* (Jacobs, 1961) wonders about the intellectualistic perspective of urban planning, leaning towards a more concrete vision of the city strictly connected with its inhabitants. Almost in the same period, the British architectural critic Reyner Banham (1971) described Los Angeles through the idea of “four ecologies”, associating the urban development of the Californian city to a living organism. This debate is strictly related to the emergence of a new vision of the design project, that, in the same years, started becoming critical, relativizing the blind faith towards progress and the un-limited growth that dominated the design disciplines before and immediately after the Second World War. The performative experiments of the 1960s and 1970s professionals in urban and non-urban areas (i.e. Riccardo Dalisi for the Traino district in Napoli, Giancarlo De Carlo with the Team X on participative planning, Renzo Piano’s living labs in Otranto, to quote just a few examples of Italian architects and designers), demonstrate the emerging need to look at cities and territories through a mature awareness of the relationship between citizens, people, and environment.

These approaches come back in the recent debate (Busbea, 2019), while, at the same time, the top-down approach of “urban mysticism” (Celaschi *et al.*, 2018), that characterized the urban scale in the 1990s, has been gradually replaced by the care for the city as a living organism that needs constant vitality. This form of attention could be achievable through a widespread and capillary, temporary and convertible, design, which recalls continuous and small-scale mutations rather than radical change (Reale *et al.*, 2016).

The designers' action in the contemporary city subtends, indeed, various concepts, such as sustainable, participatory, co-designed, reusable, collective, replicable and scalable, technologically enabled; they refer to process that encompasses what is transient and temporary, recall participatory and small-scale activities, introduce a "light" dimension supported by new technologies. Designers know how to propose a strategy of transformation that is both gentle, effective and base on "continuity". Strong, sporadic projects have been replaced by regular, low-key projects, which are transient but visible, sustainable and shared.

Among these plural factors there is one that is closer to the concept of proximity (Boschma, 2005; Hansen, 2015): portions of cities including peripheral and/or historical areas are increasingly assimilated to open labs where experiment strategies of social and economic regeneration at urban scale activate processes that can involve both the institutional structure and economic actors, but also empower communities, paving the way for innovative models of action and funding. Urban and peri-urban dimensions are assumed in many European cities (i.e. Barcelona, Bologna, Lisbon, Brussels) as experimental fields, where to highlight and compare different forms of relations and co-production.

The paper focus on the proximity approach carried out in the research and education fields of action of the Advanced Design Research Unit (ADU) and assumed as a combination of time, space/place and cross-media practices in order to promote co-design solutions to tackle territorial and global challenges (Hasche *et al.*, 2019).

The main characteristic of this approach is to act in a capillary way through micro-interventions linked to the territory. This allows:

1. the institutions, to enter in contact with the factuality of disadvantages within the city meshes and to look at citizens in their life context;
2. the academic researchers, to directly collect qualitative data and focus on specific communities' issues and real needs;
3. the citizens, to develop a strong political engagement and active participation to the local public sphere.

As conceived by the Pact of Amsterdam (2016), the quadruple helix approach can address the increasingly complex challenges in urban areas, enhancing proactive collaboration between Urban Authorities, local communities, civil society, businesses and knowledge institutions to move environmental, economic, social and cultural progress. One of the key issues is to consider the territory as a whole, to improve the connection between urban and peri-urban areas, with the purpose of preserving and providing a spatial and infrastructural continuity, increasing mutual relations between human being, spaces, and productions (resources, flows, services) which brings together the interactions of both the natural and cultural landscape structures and infrastructures. Promoting equity, social cohesion, and active citizenship and enhancing creativity and innovation, including entrepreneurship, at all levels of public realm implies the adoption of a systemic approach, considering not only the

different dimensions of urban issues (economic, social, environmental), but also taking into account all possible connections among different actors and systems, according to the 2017 European Commission Circular Economy Action Plan.

Territories are analyzed on the basis of their inclination and capacity to support new uses, densities and modes of interaction, multifunctionality and multiculturality, formal and informal expressions of public life, protecting their recognizability, and their consolidated heritage while generating new ones. This new heritage is assumed as the result of an open innovation process (Montanari & Mizzau, 2016) activated through co-design and co-realization initiatives, and represents the best result of the "talents" with which the various actors (public sector, world of research, formal and informal communities, local and supra-local entrepreneurial fabric) contribute to the transformations of urban contexts and share them through experimentation, useful to express the real potential of spaces, overcoming the temporary nature of change and generating permanent transformations of entire portions of the city (Gianfrate *et al.*, 2018).

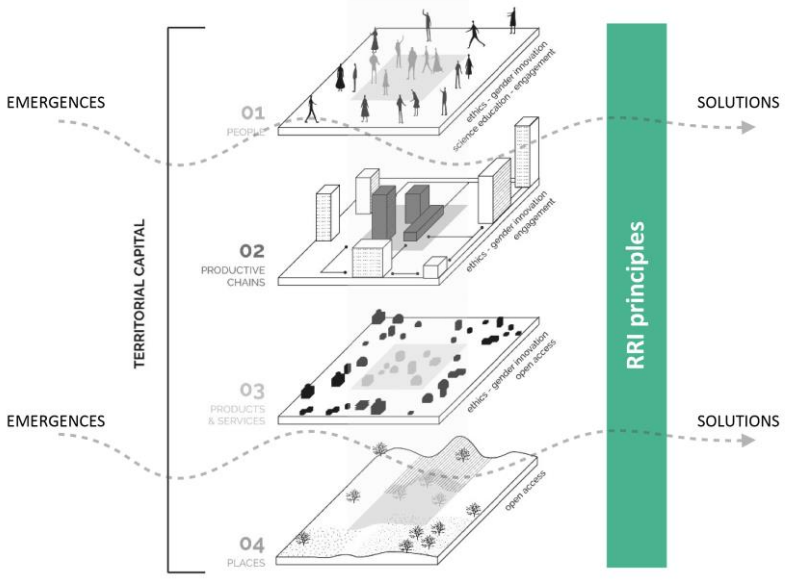

Fig. 1 Co-design methodology, Advanced Design Unit (ADU), Department of Architecture, University of Bologna.

2. Citizens as creative/creativity's agents

In the contemporary realm citizens are considered more and more actors of the change and not just witness of the continuous transformation, thanks to creative experimentations and also to the unlimited access of social networks and data, using the web to create, assemble and disseminate sensitive, personal and geographic information provided voluntarily by all of us (Goodchild, 2007).

How much do the creative processes conducted by citizens modify the city and our local networks? On a global scale, at the beginning of the 2000s the role of activator of change was projected on the free-lance creative subject – falsely generalized under the name of the "creative class". In fact, this "class" was constituted by divided individuals– divided by their (precarious) living condition, in the (temporary) spaces in which they moved, and by the (reduced) times in which the city is experienced (Florida, 2003). Today, however, the ability to interact, plan and guide change has expanded to the whole community, addressed to citizen science. This phenomenon can be read with divergent lenses: on the one hand, it can be a declaration of the extreme trust achieved in the planning skills of the communities, through their participation in co-designed processes; on the other, it can be a denunciation of the inability of the political class, administrators, urban planners, sociologists, anthropologists to have an integrated, anticipated and systemic long-term vision about the transformations of cities, which therefore gradually leaves shares of responsibility and space for citizens to make the city by living the city (De Klerk, 2018). In both cases, the issues of governance and the centrality of citizen science respond to an ever-increasing need to redefine the identity of the city-community which, subject to its continuous transformation, loses the sense of belonging to itself, and to confine the depersonalization and alienation drifts that globalization has generated. The concepts of subsidiarity and proximity communities can partly give an answer when asked whether the city is a physical place or an idea that needs to be continually reshaped (Sudjic, 2016).

In Italy, a constitutional review law in 2001 introduced the principle of horizontal subsidiarity into the Constitution, favoring "the autonomous initiative of citizens, individuals and associates, for the performance of activities of general interest, based on the principle of subsidiarity" (Italian constitution, law n. 118, last paragraph). The new regulation recognizes that citizens are able to act independently in the general interest and provides that institutions must support their efforts in this regard in their specific territories.

Considering citizens as prosumers of the territory, their creative productions can be assumed as drivers for new rhythms and connections in urban life. This concept opens more fruitful options for creatives, makers and users (De Klerk, 2018) and define a new conception of creativity, artistic, cultural and technical production (Bianchetti, 2014; Bishop, 2012). Thus, the territorial identity and the site-specificity of creative processes could be enhanced also due to the opportunity to activate, trace and consolidate relationships with local productive and commercial networks (Evers, 2014).

The participation of mixed groups even in unconventional and disruptive forms (Goodchild, 2007; Bergevoet & Van Tuijl, 2016) can play a role in the reconfiguration of the urban order. Kevin Lynch (1964) describes these reconfigurations as new social forms and solutions which, if properly valued and supported, can contribute to the creation of innovative systems connected to the networks of local activities, stimulating projects from micro to macro-scale in an integrated and complementary way (Haydn & Temel, 2006).

The Advanced Design Research Unit of the University of Bologna is currently involved in the design and experimentation of new services and products, able to face territorial issues coupling the proposed proximity approach with a global perspective, contributing locally to the achievement of grand challenges (i.e. SDGs of EU Agenda 2030, RRI principles, etc.).

3. How to combine higher education institutions people, production and territories: the work of the Advanced Design Unit

Since its birth in the academic year 2013/2014, the Advanced Design Research Unit (ADU), through the Industrial Product Design and the Advanced Products and Services Design Bachelor and Master degree courses, feeds a circular network, designing a learning structure and process based on a quadruple helix approach able to connect research, enterprises, public entities and communities. The experiential learning and the development of an entrepreneurial mindset incentive the synergies between design education and the production environment of the Emilia-Romagna Region.

The exchange of design practices and tools within production systems has allowed companies and institutions to deal with research in order to anticipate new models and processes, but also future business scenarios with a direct impact on the social-economic environment. The rich network of relationships and the relational spaces (virtual and real) have the same importance of the products realized and led the construction of a dynamic observatory of local businesses, in order to open research scenarios, training and application of innovation models guided by design (Celaschi, 2016). On one hand, this observatory monitors the exponential growth of companies affiliated to the University, on the other hand it is a database for students' internships to enhance the connection with the territory and the capacity to face local challenges with a global vision.

The synergy between this economic system and the Design cultures' program of the University of Bologna has therefore become, in addition to a peculiar characteristic of the territory, an emerging opportunity to enhance design for proximity (Vai, 2017) in terms of:

- learning activity and internships in line with the most emerging innovative trends at local and regional level;
- consultancy and special projects connected to the specific needs at local level;

- linked initiatives to strengthen the third mission of the University;
- knowledge exchange among formal and informal institutions;

value co-creation thanks to the capitalization of collective intelligence and creativity expressed by citizens in specific or cross-sectorial networks, also in connection with the Regional Clusters Structure (www.retealtatecnologia.it/clust-er).

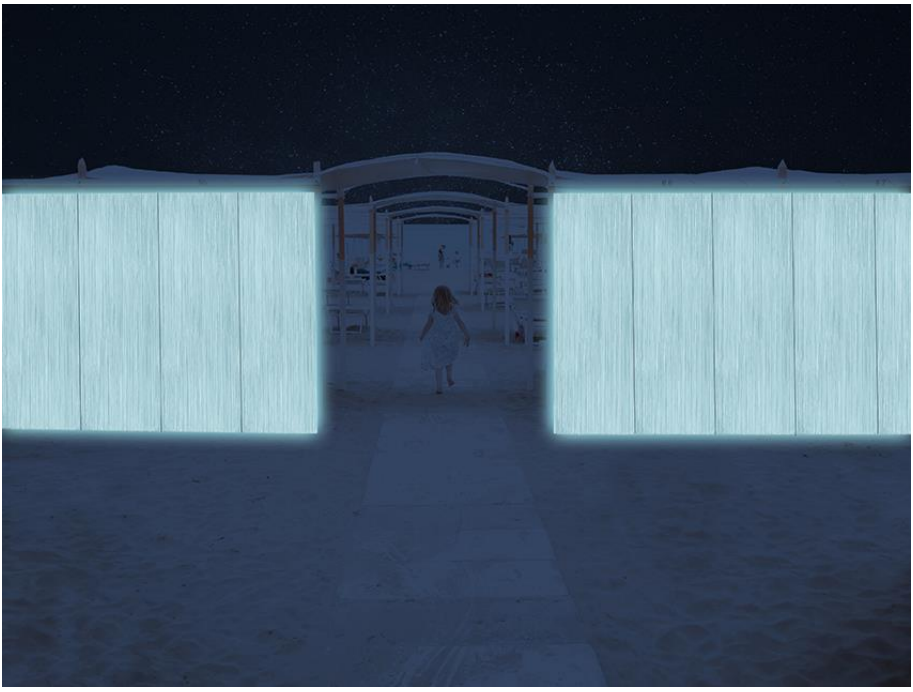

Fig. 2 Almare-night (night at the sea) is one of the scenarios and area of application of ceramic slabs with luminescent properties as outcome of the advanced design workshop with Target Group (rendering Advanced Design Unit).

Referring to the previously mentioned actions, the direct and constant relation with the real-life setting promoted inside the courses is part of the proximity approach, addressed to develop, among students, the ability to explore and mediate the different aspects of the territories of intervention. The goal is learning how to provide design responses applied to specific cases, understanding how to use methods and tools for competitor analysis, and conceptualizing product-service design systems, facing year by year higher level of complexity. At the master's level, the model for designing relationship with the actors and stakeholders of the local social, economic and cultural system is managed in a more structured way, with the creation of specific paths and through forms of convention for teaching both in class and inside companies. The results of these continuous collaborations

led to "special projects" in which the relationship between university and territory is managed thanks to the involvement of the Advanced Design Research team. The Workshop with Target Group on new scenarios and areas of application of ceramic slabs with luminescent properties, or the collaborations with Hera to transit their corporate academy to a wider learning network, constitute just few of practical cases.

Fig. 3 Almare-day (day at the sea) is one of the scenarios and area of application of ceramic slabs with luminescent properties as outcome of the advanced design workshop with Target Group (rendering Advanced Design Unit).

A further level of collaboration concerns the dissemination and promotion of the relationship between universities and stakeholders to enlarged communities through the organization of thematic workshops and events. The workshop's model adopted at the beginning of each academic year is based on real challenges presented by local companies or local entities, short term to elaborate concepts-ideas-solutions in informal space outside the academic classrooms, to strengthen the students' sense of entrepreneurship and sense of belonging to Bologna and its University. These initiatives create opportunities for growth through real synergies and collaborations. The workshops' topics deal with the innovation of products, services and processes, digital humanities, interaction and, of course, advanced design. For example, at the beginning of the past Academic Year and in occasion of Bologna

Design Week, Via Zamboni became a living experimental lab within Le Cinque Piazze's project, a co-design and self-construction workshop aiming to care for the university area, temporarily redesigning the public space, curated with and by the Fondazione Innovazione Urbana, the Department of Architecture of the University of Bologna, the Fondazione Rusconi, in cooperation with the Municipality of Bologna, as part of the activities envisaged in the ROCK project (Regeneration and Optimization of Cultural heritage in creative and Knowledge cities H2020-SC5-2016-2017 GA 730280) won by the Department of Architecture.

Fig. 4 Piazza Rossini Green. Unexpected grass square in the historical center of Bologna (Ph. Margherita Caprilli).

Another instrument of contamination and cross-fertilization between the Advanced Design Research Unit, the community of the Design Courses and the cultural and productive context is the Bologna Design Week, directly managed by the research team. It is the opportunity to spread the students' projects in design talks and installations in the city in order to narrate the relationship between design, territory and manufacturing, to inform the communities of citizens and non-professionals about the last innovation and creativity productions and to open contaminations between different disciplinary areas. As an annual event Bologna Design Week transforms the city for one week into a "theatre of wonder", experimenting the creativity of designers in site-specific, immersive and participatory projects at the urban scale.

These activities on field are supported also by Regional Authorities, triggering by the direct involvement of different actors, companies, and collaborative groups at the proximity scale, within a more complex and capillary system of elements, creating a network with existing infrastructures.

Following this objective and investigating a wider concept of proximity which implies a transdisciplinary approach, a new academic center named C.R.I.C.C. – Research Center for Interaction with Cultural and Creative Industries has been established in November 2019, as an evolution of an internal movement, born in 2017 called Thematic Action Group CCI, promoted by the Advanced Design Unit, which saw the participation of over 70 teachers and researchers from different departments and produced a first census of the training and research program offer in the field of CCI. The new Research Center for Interaction with Cultural and Creative Industries inherits this census and intends to be a relational space with a co-productive perspective and focus its activity on the triangle between CCIs: the use and diffusion of digital and enabling technologies, the ability to create new businesses and jobs, the aim to improve cultural and social development of the territory.

Fig. 5 An urban forest in Santo Stefano square was created on the occasion of Bologna Design Week 2018 as a temporary installation dedicated to the reflection of contemporary ecology by Mario Cucinella Architects (Ph. Federica Conti for BDW).

The aim is to explore how applied research can strengthen regional cultural and creative enterprises, in the fields of technologies for music, entertainment and audiovisual production, digital communication design, fashion staging, semantic web research, anticipation and future sciences applied to business, digital humanities, regeneration and

urban reactivation, the design of services, the contamination between contemporary arts and the production of industrially replicable value, the digital applications of culture.

4. Future research branches and conclusions

To face the multiple challenges of complex contemporary phenomena and to contribute locally to the achievement of SDGs of EU Agenda 2030 it is crucial, as previously described, to create new mediation systems and cooperative platforms between local institutions, research centers and citizen science.

As previously presented, the concept of Advanced Design defines a research and training approach that fits into a specific field characterized by the crisis of the relational system between knowledge production centers (universities, scientists and research centers), companies (goods and services), and citizens. This mutual incomprehension has progressively deteriorated the mediation structures, insufficient to keep together mutual perspectives and shared visions of future potentials. In a scenario characterized by inclusiveness, openness, responsible forms of innovation, enabling technologies and the search for sustainable solutions, these mediators appear not able to renew their objectives and facilitate the exploration of opportunities. On the contrary, this mediating area is full of opportunities: it is becoming the territory in which recover bi-univocal relationships between the involved actors in order to share the processes of ideation, creation, realization of the desirable, possible and shareable future. This is the objective of the first phase of exploration of the Advanced Design Unit: educational and research paths for product and service design have been consolidated and have accelerated the activation of multi-level relationships between companies, people and universities' courses.

The launch of the new Research Center for Interaction with Cultural and Creative Industries open to a new phase in which the Universities' role is addressed to a knowledge building more and more oriented to guide the dynamics of a responsible and cross-sectorial society, put in action research lines and design perspectives, overpassing the borders of specific circuits.

The C.R.I.C.C. will offer the opportunity to combine the approaches of advanced design culture(s) (Celi & Morrison, 2017) with the use of enabling technologies and data acquisition, allowing to create bonds between people, production and territories, following an open and continuously updated methodology that works at the proximity scale with a global perspective. As member and founder of C.R.I.C.C., the Advanced Design Unit will deepen, structuring and codifying its proximity approach further fields of investigation:

- Fragility factors and their impact on the context under consideration, and integration with SDGs and Research and Responsible Innovation Indicators;
- Availability and interpretation of sensitive data (big-data) and design of their social sharing. Working on the interoperability to facilitate the communication

among people and machines it is possible to create new services or update existing ones to improve the quality of life and people's autonomy;
- Co-design and involvement of stakeholders and citizens in data analysis through forms of crowd mapping and crowdsourcing;
- Implementation of adaptive governance systems (Folke et al., 2005; Goodchild, 2007) that exploit the potential of the widespread network of subjects (citizens as sensors) to support central decision-making processes.

Cities and territories become design spaces: they can be interpreted as a creative potential for the community of designers, end users and actors with different skills, enabling them together with small/medium-sized enterprises to a new approach to enhance knowledge and awareness of the regional entrepreneurship and its production processes.

Abstract | Radius 100 is a social design action seminar co-framing the "right to the city" with the moto "beyond academia". The seminar aims at developing projects through focusing on the diverse experience of urban users in site-specific setting of 100 meter. A concept model discoursing multidisciplinary theories and methodologies and design practices is introduced as a platform for enveloping people & place with design-based projects. Four (4) core pillars guideline the model: (1) theory (2) methodology (3) design charrettes based on cross- disciplinary methods (4) applied tools. Divergent thinking and open inquiry are the fundamental values of the mode action enabling open-ended processes in building up projects for urban social sustainability. The project`s conclusion after its implementation in the past two academic years is that adopting the Radius 100 model as a design project skillset aspires to construct dialoguing research, social design methods and communities as a platform for social sustainable innovative projects

KEYWORDS | SOCIAL DESIGN, OPEN INQUIRY, DIVERGENT THINKING, MULTI-DISCIPLINARY APPROACH, URBAN COMMUNITIES

1. Introduction to Radius 100 model's skillsets and toolkit

Radius 100 is a social design action seminar focusing on developing social design interventions through landscaping the diverse experience of urban users' site-specific settings defined by a radius of 100 metres. Social design focuses on applying design processes in identified opportunities within the social terrain so as to encourage relationships between people, communities and institutions.

By co-working with a wide range of stakeholders invested in social sustainability such as: academic researchers, design students, urban policymakers, local communities and urban cooperatives that drive sustainable design and art interventions as local activism a new form of co-knowledging design academia and beyond academia. In other words, working out an academic knowledge & design-based model of multi-disciplinary theories and methodologies can lead to new design practices for creating social design proposals (and their feasibility) for urban site- specific. The methodological model developed in this project offers therefore a new discourse for enacting communities 'right to the city'.

Divergent thinking and open inquiry are the fundamental values of Radius 100 model in building up multi-disciplinary knowledge, skillsets and toolkits. Four (4) pillars were developed in the concept model: (1) theory-core aspects in diverse urban themes, (2) methodology-mixed research & exploration methods, (3) design charrettes based on cross- disciplinary methods and (4) applied tools.

This lecture paper introduces the Radius 100 concept model by elaborating on each pillar`s value creation to an open social design practice by presenting a concept visualisation that analyses the different processes of the student's projects that were conducted from 2017-2019. The varied components enabled the formation of open-ended processes and encouraged student's creation of new and innovative social design experimentation.

Looking at the transition that occurred in the projects from model to social design as a viable design practice in situ assured the value of framing academic knowledge side by side student`s diverse, and at times negating, toolkits while also highlighting an opportunity for game-changing in social design projects.

From 2017-2019, the seminar's model facilitated knowledge platforms and social design projects in urban social sustainability. A two (2) stage pilot was carried out: (1) 2017-2018 and (2) 2018-2019 (28 weeks in each academic year, a total of 56 weeks). The piloting of the model entailed an ongoing divergent and open process of implementing the step-stages of the model. The study process produced various proposals and products based on co- working and co-knowleging with art/design cooperatives and community members and through feedback meetups with municipal personnel. This many-layered development processes defined the components in the landscaping of the concept model.

The first stage in piloting the model's framework was carried out in 2017-2018 envisioned within the Radius 100 concept of an art exploration residency in Jerusalem's Mahane Israel

neighbourhood developed by the artist and urban activist Noa Arad-Yairi and her partner Yuval Yairi from artists' and designers' cooperative `HaMiffal`.

Co-working and co-knowledging with the cooperative community of 'HaMiffal' and community members of Mahane Israel neighbourhood allowed for the development of eight

(8) projects by the students. The projects researched various socio-typology aspects in situ, which were translated into research in urban sustainability and social design proposals. Focusing on the people-place-design trialogue offered a knowledge toolkit that is also applicable to the ongoing urban activism (actual and potential) of the involved community. The themes that were explored touched on soundscape, walkability, urban community gardens and different aspects of the site's gentrification.

The conclusions of the first year's pilot prompted in 2018-19 a wider engagement with the artists' and designers' cooperative 'Muslala', creative industries and with additional agencies empathic to the question of a 'sense of place'. Five (5) projects were developed as a proposal for social design intervention in specific urban landscapes by communities and art/design urban cooperatives. The projects focused on the implementation of psycho- geographical street structures for senses experiencing urban space enacting urban visualisation installations by gamification and frames for community-based socio- meetups. In addition to the above projects, one (1) particular project adopted the Dérive method as self-documentary by focusing on the antagonistic life experience in the urban space of Jerusalem for those who are defined by a political agenda as marginal groups. This candid exposé added a knowledge tool of the 'invisible communities' to the capacity- building of 'Muslala's' urban work.

The project's conclusion after its implementation in the last two academic years is that adopting the Radius 100 model as a design project skillset paves the way for a viable toolkit that aspires to offer sustainable innovative projects and products in and beyond academia through dialoguing, co-working and building capacities for and with the creative class and creative agencies in social entrepreneurship in urbanism.

2. Concept Model

2.1 Theory

Theory is defined in the model as a methodological tool that structures research & exploration as a value drive for socio-cultural awareness and understanding when designing urban social design proposals. It is our academic conviction that adopting diverse bodies of knowledge adds a layer to exploring, gathering and analysing findings as comprehensive step-stages in applying Radius 100 model.

The co-framing of theory and design allows for dialoguing multi-disciplinary research knowledge with design intuition, inspiration and creativity. The 'usability' of theory as a key component aims to build up and validate the concept development stage of the urban social design proposals.

Theory as a component offers a cluster of theories such as urban theory, environmental psychology, field and senses-based theories,1 material data and global and local case studies. Theory is guided by the core vision of Lefevbre's 'the right to the city', which presents a 'call to action' in reclaiming the urban life of the city as a social space where people uphold their responsibility, involvement and intervention as city citizens in the process of re-shaping urbanisation. The notion of the 'right to the city' echoes in latter theories in the demand for social justice and confronting spatial inequalities regarding marginal groups side-by-side and with the demand for a dignified access to urban life as basic but often negated human rights manifest.

Debord and Lynch adopt this meta-urban idea when articulating, at times manifesting, their theoretical and methodological claims of 'Dérive' and 'imageability' as tools for re-shaping and analysing urban socio-typological spaces. The theory of the 'Dérive' offers a method for urban exploration focused on spatial and socio-spatial relations as a strategic tool embodying the political thought of the 'right to the city'. At the core of this method is a form of drift-walking2 in an urban environment in which one or more participants let their usual objectives, engagements and daily tasks go for a defined period and plunge themselves into a behavioural disorientation of their habitual axes so as to be drawn by unplanned social encounters, sensual-spatial attractions and varied ambiences of the terrain.

Debord emphasises that this method is not 'mere exoticism' but instead offers a critical analysis of the city. As a central method of the situationist's movement, 'Dérive' is perceived as a metapraxis of psycho-geographically3 'collage' mapping through a process of creative re-imagining the socio-typology of the city; i.e., countering and disrupting the standard typological representations of space so as to reveal fractures that signify an imagined proposal's possibilities of what in latter theories would be defined as promoting bottom-up suggested interventions.

Another aspect of capturing a new notion in re-reading the socio-typology of the city is Kevin Lynch's 'imageability'. Imageability refigures, through a perceptual form of the urban physical environment, urban users' mental maps of the city as a visual articulation of behavioural

[1] Such as analysing (a) the phonic identity of the city through sound-maps and designing soundscape for social designed spaces: 'The soundscape technique uses a variety of investigation techniques, taxonomy, and measurement methods, sound-walks, questionnaires, interviews and recordings' (Schafer, 1977) and (b) walkability as a multi- defined urban action regarding the various fields of physical environment, sustainability, accessibility, health and safety urban expressions and social & social justice concerns (Pak, Verbeke 2013).

[2] Debord defines the praxis he suggests as 'rapid passage', while the translation favours the concept of 'drift' as articulating the core idea (Debord, 1956).

[3] The effect of environments upon emotions and behaviour not as a recording or tracing but as an active intervention.

geography and considers main urban elements such as paths, nodes, edges, landmarks and districts.

William Whyte's study of pedestrian behaviour as a city's socio-dynamics further adds a methodological frame for observing and analysing individual engagements and community/social interactions and their dynamics in public spaces such as corporate plazas, urban streets, parks and other open spaces.

The main issues proposed by these core theories are contextualised locally by focusing on Israeli site-specific theories, such as Fenster's work on the question, 'Whose city is this?' (Fenster, 2012) debating bottom-up knowledge offering a viable component for city policymakers; Churchman's emphasis on the importance of the democratic aspects of the public sphere as an aspect of social justice concerning urbanism (Churchman, 2002); Hatuka's work on looking at the city as an experimental territory when exploring the 'sense of place' as a an immanent part of self/group social construction of loci habitus (Hatuka, 2013) and Yacobi on uncovering space memory and dispossessed groups and communities (Yacobi, 2011).

These baseline theories support the model's agenda of social design as a sustainable intervention for encouraging city's citizens' involvement in the various aspects of city life as an integral aspect of creating their sense of place.

2.2 Methodology

The methodology component focuses on integrating field research, creative thinking & design inquiry as methodological steps in formulating social design and design as a praxis for advancing 'proximity culture' in situ when exploring people and places in Radius 100 site specific.

Four (4) main methodological steps are frame worked:

- Site-specific analysis by applying Lynch's Imageability and situationist's 'Dérive' drift walking.
- Mapping possible social design/design action interventions by applying field thick description, documentation and visual &/or sound materials.
- Working through experimental frames based on the reflexive and reflective evaluation of research and practice-based findings.
- Pitching social design/design implementation proposals to professional stakeholders, site-specific communities and artists and designers in urban cooperatives that drive sustainable design and art interventions.

Figure 1. *Radius 100 Site exploration, Asaf Weinberg, Yaara Farber & Alina Ixanova. Department of Industrial design, Department of Architecture, 2019-2020*

Figure 2. Shahed (Witness), Yusuf Rajbi. Department of Ceramics and Glass Design. 2017-20

2.3 Cross-Disciplinary Design charrettes

Adopting cross-disciplinary methods as a leading concept for design charrettes triangulates theory, methodology and applied tools with: (1) participatory research approach that emphasises bottom-up knowledge based on qualitative dialogues with creative class (urban activists), social and municipal entrepreneurships and local communities; (2) combined knowledge platforms via cloud for and by students that encourages knowledge crossing by sharing textual, visual and material concepts; (3) cross-disciplinary teams that offer various skillsets such as co-knowledge design toolkits, mutual team learning and innovative social design toolkits.

2.4 Applied Toolkits

The fourth component refers to applied toolkits, a component that combines the seminar's theory-based field tools with students' design-based skillsets formed in their affiliated departments. This component adds an additional frame to the cross-disciplinary design charrettes component.

Two (2) sets of applied toolkits are formed:

1. Visual/audio representation tools: photo/audio database, a cluster of design tools and different forms of spatial mappings. These diverse tools offer a frame for creative inspirational ideas and images in prototype modelling.
2. Concept visualisation tools: team-based toolkit (seminar toolkit & team members' departmental skillset) articulating projects prototype proposals.

Figure 4. Conceptual model of "Radius 100: Research, Design and Community" seminar developed by authors

Table 1. Open inquiry and divergent thinking based projects

Theme	Selected project	Methodology
Sense of place: Artistic material representation of counter-historical narratives of the dispossessed Added value: . Developing a unique innovative design technical brief. . Emphasising artistic materiality workshops as an aspect of proximity culture[4]	Shahed (Witness), Yusuf Rajbi, Department of Ceramics and Glass Design 2017-2018 As a ceramic artist, Rajbi had a special interest in the material research of the historical (6th century) Muslim cemetery of Mamila. He pinpointed the 'Shahed', a small sculptural object placed on Muslim tombs as a witness to the oneness of God, as his material and artistic exploration. In the context of the specific site inquiry, the 'Shahed' embodies also a complex socio-political statement because of its narrative connection to HaMiffal's Palestinian history. Rajbi developed a unique innovative design technical brief that placed the Shahed as a standing sculpture that carries the counter-site narratives of past and present of Palestinians and Israelis. As an artist, however, he allows the technical brief to stand by itself as an artistic process. Rajbi's product was added to HaMiffal's self-identity and was developed into a community-based workshop held at HaMiffal's house.	
Sense of place: Socio-spatial site exploration Added value: . Proximity culture: In situ spatial and socio-spatial relationships . Experiencing the social use of tangible space & place	Walkability, Sharona Kremer, Yotam Oron & Yaron Marcovitz, Department of Architecture 2017-2018 The project explored the theme of 'Walkability' through self-documentary-mapping of the daily routine in the neighbourhood's spatial typology. The self-focus mapping unfolded the nature of the relationship that has been developed personally, interpersonally and publicly. The findings through the implementation of visual methodology portray the self-experience of the personal and social use of tangible space	

[4] Author's note: This project presents a thematic challenge since by emphasising the materiality brief as a leading theme in the process of community-based social design, the politics of counter-historical and identity narratives were put aside by the artist.

Sense of place: Soundscape, the sound of negating socio-spatial identity Added value: . Sound maps as a spatial-political analysis tool . Analysing phonic identity in situ	Soundmaps: Vacant 'Spirit of place', Ismael Faroun & Nagham Copty, Department of Architecture 2017-2018 Ismael and Narram analysed the 'spirit of place' in Mahane Israel' neighbourhood by narrating soundscape in different locations. Their theme aspired to unfold and emphasise the strong negation existing between the concept of a vibrant socio-spatial urban typology and the non-voice that envelops the specific site space. This knowledgeable description offered another layer to the activist's campaign against gentrification processes.	
Community-based social design: Added value: . From online to offline. Offering an additional platform for fostering and cultivating community proximity relations	Real Life Encounters Facebook: The Material Museum of Storytelling Objects, Dor Gershovitz, Adi Lax Aviezer & Tali Saquin Department of Architecture, Department of Industrial Design 2018-2019 The 'Nachloaot' community fashioned intensive personal and communal ties based on the digital platform of Facebook. An intrinsic social interaction was an ongoing cycle of object exchange. In the spirit of human sustainability, the project proposed an additional physical social platform for the engaged community by moving from virtual encounters to face-to-face meetings and by sharing personal narratives of objects through an architectural form of a museum-like ephemeral space in the actual living space of the neighbourhood.	
Psycho-geographic structures in urban place I Added value: . Engaging city citizens in experiencing a sense of place through the use of senses	Space of Silence: A Psycho-Geographic street scene, Eden Paz, Rasha Abu-Amir & Gregory Kern, Department of Architecture, Department of Industrial Design 2018-2019 The project introduced a psycho-geographical object that triangulates vision-scape with soundscape and offers a momentarily 'haven of silence', i.e., an open-closed structure that invites urban users to pause and disconnect from the noisy and hectic surroundings of the street. The inclusive object introduces through its liminal space an experience of a blur of sight and sound that creates a diversified new outlook on urban space.	

Psycho-geographic structures in urban place II Added value: Urban gamification	Interactive Installation in Urban Space, Shira Kaufman & Nadia Adler, Department of Photography, Department of Industrial Design 2018-2019 Nadia and Shira's project focused on the social life of urbanism. Using the urban street as a platform, the project proposed an interactive installation based on 'moving films' that portray visual sequences of Israeli urbanism and nature habitat. The installation necessitates the participation of the urban user as the moving films screen comes to life only through cycling. The aim of the project's apparatus is to encourage urban citizens to reclaim urban space as their own front yard by 'staying in' and not just passing through.	
Gentrification processes: Property-based, site-specific 'right to the city' Added value: In-depth case study analysis of David Harvey's theory on gentrification processes of accumulation by dispossession	'Accumulation by Dispossession': The use and abuse of community members' ignorance, Merav Dahari, Department of Architecture 2017-2018 Meirav`s project on 'accumulation by dispossession' explored the different layers of the current gentrification process in the site, identified the stakeholders and uncovered the links between economical profit, legislation and the use and abuse of community members' ignorance in this matter. The project heightens the future prospects of the community's negotiations on its identity and day-to-day urban life and constructs a knowledge tool for community members in their struggle against ongoing gentrification processes.	

The project development of each student or group of students reflects the nonlinear process evolving according to core themes presented by student's site-specific project. Each project reflects a selected cluster of relevant toolkits applying the diverse bodies of knowledge (theory and practice) that discourse with their themes.

The projects vary in their themes and offer in-depth, site-specific case study analyses of an urban macro theory by concentrating on a theoretical baseline and applying a personal selection of methodological processes and different toolkits. The concept visualisation identifies the different stages applied in the process of each project.

All projects were presented to their potential urban stakeholders.

3. Reflective summary

The added value of the model work-process discussed in this lecture paper can be summed up by seven (7) main points:

- Applying open inquiry and divergent thought and methods for social design by integrating diverse, multi-disciplinary theories and methodologies, participatory research, design exploration and design practice. Discoursing academic-based knowledge with students' design practice skillsets and toolkits 'pushed' students outside of their natural comfort zone and offered a new knowledge skillset for design.
- Creating innovative and/or new social design proposals by implementing multidisciplinary frames through the challenge of balancing all four parts of the model in the workflow.
- Encouraging and developing diversity through cross-disciplinary student work teams and team-based co-learning, and by developing co-knowledge in students carrying diverse and at times negating toolkits.
- Inspiring curiosity and passion for an additional knowledge-crossing framework for design (in our case, social design) implementation.
- Dialoguing urban cooperatives, activists and stakeholders and local communities with design academia for social design entrepreneurship.
- Emphasising bridging academia (the hub of creative class) with creative agencies by investing design strategies in a knowledge skillsets and toolkits.[5]
- An unplanned value of the seminar was the identification of the effect of 'human resource'. The makeup of the student's team was instrumental for the content of the seminar, as it allowed sharing each student unique design brief and evolving beyond their personal perspective.

Looking at the different volume of the projects produced in the now three (3) years of the seminar reflects a varied range of themes. In the first year (2017-18), most of the projects were research-driven, analytical and focused on site exploration concerning urban sustainability issues, as the majority of the students were affiliated with the architectural department. Other projects in this year reflected a personal aptitude for art activism. In the second year (2018-19), the proposed projects focused on social intervention in urban and community spaces through objects, street structures and redesigning personal and/or local space. These proposals, though designed for a specific space, were not site-bound and could stand as a design brief for a social design intervention in other locations. In this current year (2019-20), projects are oriented at (1) community art-based objects for psycho-geographical

[5] In the specific case of Radius 100, the knowledge skillsets and toolkit were applicable to the urban activism of the communities and the art/design urban cooperatives.

sustainability action, (2) a performance event promoting community's proximity culture, (3) producing design products for community's sense of space place and (4) uncovering site specific `s historical narratives as part of an in-depth sense of place.

The variety of the projects themes in each year posed a challenge in working with stakeholders and urban communities that were diverse and different in each project. Connecting with stakeholders is significant to the seminar, and also poses a challenge in terms of connecting relevant stakeholders to each project, and their involvement in the process. The common ground that encompassed all the projects was the definition of a site-specific urban space and co-working with activists and artists who engage in various ways of community action and know the city and its residents in depth.

The motto 'beyond academia' stands, therefore, at the core of the Radius 100 methodological model. The concept model and it`s components were constructed through a reflexive and reflective process with the defined stakeholders to a pilot engaged in the implementation prototype and dissemination processes of urban social design.

The 2017-18 projects were exhibited at 'HaMiffal', an historical Arab house in the site specific of the seminar that carries the complex identity of the neighbourhood and currently functions as a centre for art and art performance ventures promoted by groups of artists, activists and students of design. The research and the exhibition were carried out with the active involvement of 'HaMiffal' activists and community representatives. In 2018-19, the action seminar concluded in an exhibition at Muslala centre (a place for social activists and artists working in Jerusalem urban communities) and held a unique pitching presentation in front of various urban stakeholders (municipality and community). This current year is yet to be planned.

Rethinking User Experience of Parking Garage. Exploring Innovative Suicide Prevention Strategies Through Motivational Design

Sébastien Proulx*, Adam Fromme, Leila Akberdin, Maria Basile, Olivia Forsyth, Maya Jenkins, Abby Nelson, Claire Spicer

The Ohio State University
*proulx.12@osu.edu

Abstract | Suicide rates on university campuses are increasing. University parking garages, in particular, have become "hotspots" for these tragic events. In response to death-by-jumping attempts at these locations, authorities have installed preventative measures at the edge of higher levels of parking garages (structural barriers, help hotline signage, etc.). Although these coercive interventions generally are seen as effective in preventing suicide, collectively, they do not improve the quality of the user experience or provision necessary support, once potential jumpers return to a typical mindset. The shortsightedness of these approaches contrasts with design's capacity to contribute to the development of environment geared toward people holistic well-being. In this context, a successful approach needs to go beyond suicide prevention and instead pursue a culture of care. This new approach, moving away from a coercive solution, may positively affect well-being perceptions of *all parking garage users*. Through a student-led workshop, we explored potential motivational designs (by creating somatic interactions, emotional reactions, and social engagement) to initiate a critical discussion on our current approach to context sensitive intervention.

KEYWORDS | DISRUPTIVE INNOVATION, CULTURE OF CARE, SUICIDE PREVENTION, MOTIVATIONAL APPROACH, CRITICAL THINKING

1. Introduction

Since 2000, there have been 58 documented suicides on the campus of The Ohio State University (OSU) in Columbus, Ohio (Zachariah, 2018). In 2017, there were six suicide attempts by jumping from the campus's parking garages. Those incidents prompted the University to investigate parking garage security and led to more serious reflection on students' mental wellness. In March 2018, University President Michael V. Drake commissioned the OSU Mental Health and Suicide Task Force. Since then, decision makers have restricted access to the rooftops, added barriers to prevent further falls, increased the presence of security foot patrols and campus police, and placed permanent signs in the stairwells of all multi-level parking garages featuring the University's counseling hotline number. In design terms, the University's actions are considered coercive (or direct) strategies to enforce certain modes of use, or to limit unwanted behaviors.

Figure 1. The Ohio Union garage with suicide fencing on top level and hotline signage

The University's actions are commendable and understandable. No one could argue against measures that may prevent student deaths. However, these interventions do not directly address the first recommendation of the Mental Health and Suicide Task Force, which was for the University to embrace a "culture of care." In this culture of care, suicide prevention would seek to address underlying issues from a community perspective—encouraging students, faculty, and staff to reach out to one another. Advocates of this type of person-centered community approach, such as Ulrich Beck (1992), would argue that chain-link fencing, police presence, and prominent signage are counter to a culture of care. To designers, such interventions may also be considered reductive within the scope of environmental design improvement that is possible to address a problem of this nature.

In response to these University measures, five undergraduate design students approached faculty members of the newly established OSU DESIS Lab, wanting to contribute their talent and creativity. These students believed that they could mobilize around the originality of their person-centered view on life matters and their capacity to facilitate collaboration and dialogue beyond traditional disciplinary boundaries to foster innovative and disruptive ideas for suicide prevention. Building on contemporary experiments in suicide prevention, the authors engaged in a Research-Through-Project (Findeli, Brouiller, & Martin, 2008) to examine an approach of place-making wherein experience design and motivational design strategies (Thaler & Sunstein, 2009) would address the parking garage situation and help establish the culture of care sought by the students. To examine the extent of design's role in suicide prevention, the authors set out to explore how parking garages could be redesigned to reflect how environments can positively affect mental wellness. Although our approach is focused on indirect and subtle changes, it represents disruptive and critical perspectives on the actions suggested in the guidelines of the United States National Strategy for Suicide Prevention (Office of the Surgeon General, 2012). Those national standards can be considered efficient in many ways; however, the underlying evidence-based approach yields only incremental changes. Fixation on a proven-only approach, by definition, leads to a broad dismissal of alternatives and serves as a barrier to innovative thinking. As Mishara (2003) points out: because mental health and suicide are multidimensional and complex social problems, prevention demands innovative thinking and solutions.

In this paper the authors present and discuss a typology of indirect strategies induced from student-designed prototypes. Tasked with the challenge of developing novel motivational design strategies, we question current suicide prevention approaches. This paper reflects on how a design research endeavor may help change perspectives on complex social matters.

2. Background. The need for innovative thinking in suicide prevention

In the United States, more than 47,000 people died by suicide in 2017 (Center for Disease Control and Prevention, 2019). Deaths by suicide in the U.S. rose by 30% between 1999 and 2016 (Hedegaard, Curtin, & Warner, 2018). This makes suicide the second leading cause of death for people aged 15 to 29 (CDC, 2019). Further, college is a stressful environment which puts university students at greater risk. A report from the National Alliance on Mental Illness (2012) found that 64% of students who do not complete their college education do so because of mental health reasons. Another study by The Ohio State University Suicide Prevention Program (2015) found that 59% of students felt helpless. Sadly, many studies connect these (and other) mental health issues to suicide.

Although suicide is preventable, prevention must be considered a never-ending endeavor. No single factor causes suicide, nor does a single factor contribute to mental illness leading

to suicidal ideation and self-harm. Among the methods of suicide (hanging, drowning, etc.), suicide by jumping makes up a relatively low percentage of the reported deaths. However, the choice of method seems to depend largely on access and availability. In an interview with ABC News, Adam Kaplin, Assistant Professor of Psychiatry at Johns Hopkins Medical Institute, commented that "when people don't have access to firearms and get it into their heads that they don't think pills are going to work, they think there is something about the finality of [jumping] and think 'If I just do this it will be over'" (Friedman, 2008). This observation seems particularly relevant for young adults. A longitudinal study carried out over 12 years in Norway revealed that 30% of those who committed suicide by jumping were between 15 and 24 years old (Sæheim et al., 2017). For university students, an unpopulated parking garage provides isolation, access, and availability.

Traditional suicide-by-jumping prevention efforts focus primarily on limiting access. Locations install structural interventions (barriers, safety nets, etc.) at the edge of higher levels to prevent access, and most studies support the effectiveness of these structural interventions, despite the notion that suicide-minded people simply will go somewhere else. For instance, O'Carroll, Silverman, and Berman (1994) found that the addition of a suicide-prevention fence at the Duke Ellington Bridge in Washington D.C. did not increase the number of jumpers at the nearby Taft Bridge. While one study by Sinyor and Levitt (2010) found that, although suicide rates at Bloor Street Viaduct decreased after barriers were installed, overall suicide rates in Toronto stayed the same; this study appears to be an outlier. A meta-analysis of the effectiveness of structural interventions (Pirkis et al., 2013) found that following the interventions, there was an 86% reduction in suicides by jumping per year at the sites and a 44% increase at nearby sites. This study also concluded that there was a net 28% reduction in all suicides by jumping per year in the study city. With this evidence, many city authorities rely solely on the effectiveness of structural interventions.

This access-focused approach is also common on university campuses. Cornell University posted security guards and installed fences and netting around university-owned bridges where six students died by suicide during the 2009–2010 academic year. New York University installed plexiglass barriers inside their library after two suicides in 2003 and installed floor-to-ceiling metal barriers after another suicide in 2009.

In design terms, these types of structural interventions are considered coercive (or direct) solutions—these designs force wanted behaviors or deny unwanted behaviors. Although this approach succeeds in meeting its targeted purpose, in implementing these barriers, most authorities do not seek broader success, defined through the lens of all parking garage visitors. From large help-seeking signage to tall black metal fencing, it is clear to all that these apparatuses are installed to prevent suicides by jumping. The bluntness of the installations shows that priority was not given to the broader visual or aesthetic qualities found through experience design. One notable example seeking to avoid this visual stigma is at the Golden Gate Bridge in San Francisco, California, where work recently started on a three-year project to install horizontal netting below the deck of the bridge. Although novel

in design, this solution comes with a cost that has risen from an already high $75 million to more than $200 million. Regardless of their visual appearance, structural interventions deter motivation to navigate to the location for suicide, as well as the impulse to attempt suicide at the location.

A few innovators have conducted experiments in search of alternative ways to address suicide. For instance, the South Korean Mapo Bridge, a notorious suicide spot in Seoul, was redesigned in 2012 with sensors and positive messages along the railing that light up as pedestrians walk past (see figure 2). This approach garnered mixed reviews, with some social work experts calling the idea naïve (Chung, 2012). However, epidemiological evidence demonstrates that the frequency of suicides at that location has dropped while on-bridge rescues have dramatically risen from 15 rescues in 2012 to 93 in 2013 since its redesign (Lee, Lee, & Park, 2016). Designers and city officials adopted a similar approach for the redesign of a six-mile stretch known as “suicide black spot” along the River Foyle, which runs through the city of Derry-Londonderry in Northern Ireland. *Our Future Foyle* is an ongoing project at The Helen Hamlyn Centre for Design, which partnered with Public Health Agency Northern Ireland to explore how design can be used to uplift an area associated with poor emotional well-being and encourage residents to help make the banks, river, and bridges a lively and lived-in place (Myerson, 2016) (see figure 2).

Figure 2. Seoul Mapo Bridge/Bank of River Foyle

Universities have also tried to implement indirect motivational solutions. John Hopkins University concealed the grades of first-semester, first-year students from graduate admissions and future employers on transcripts to reduce stress and anxiety for students. At Yale University, the readmission policy was changed in 2015 by the Yale College Withdrawal and Readmission Review Committee to make it easier for students to leave for medical or mental health reasons and then return to the University. However, the use of such motivational strategies by universities has only been found outside specific suicide hotspot locations, like parking garages.

3. Thinking about suicide prevention in a cultural of care

We may never have a clear answer to the complex question of why university students choose to commit suicide at parking garages. However, we can acknowledge that, from a design perspective, parking garages are notoriously neglected. They often are hostile, dark environments, that do not obviously demonstrate care for the well-being of their users. Garages are an embodiment what anthropologist Marc Augé (2008) calls non-place—places with no existential meaning. The experience of finding oneself in a parking garage is rarely memorable. Garages are spaces designed to serve a narrow function. The issue with such approaches to environmental design is that they negate humanity and the experience of finding oneself in that place. When in the garage, a person is reduced to a simple, rationalized, theoretical view. In such a context, a person has no anthropological "thickness," no personality that may qualify a person's experience while in the garage.

In contrast, a culture of care commands that all human experience be considered as valuable and worthy, even experience in a so-called non-place. From this perspective, the use of the parking garage is no longer a commodified task but a genuinely impactful part of someone's daily routine. Here, designers' interventions can shift away from coercive strategies toward motivational approaches. Design has the capacity to motivate the adoption of healthy, safe, preferred behaviors.

Motivation, as opposed to coercion, is a soft approach, in the sense that design interventions are not enforcing behaviors. For instance, Thaler and Sunstein (2009) show that high school students' eating habits can be nudged towards healthier options simply by rearranging how the food is presented by the cafeteria. Their experiment demonstrated that placing healthy foods at the front of the display was enough to steer students' choices away from the junk food placed in the back. Although often simple and subtle in form, motivational measures can have real impact. In the parking garage context, the realizations of the interdisciplinary design firm Integral Ruedi Baur Paris & Zurich are worth mentioning (see Figure 3). Integral is regularly commissioned to address spatial orientation issues in parking garages. Through playfulness or ludology, they show that design can address people's emotional state and reduce anxiety (Baur, Braunstein, & Intégral, 2001) through desirable visual engagement. Such interventions mitigate the fear and discomfort associated with feeling lost.

Drawing from suicide prevention interventions in Korea and Northern Ireland and Integral's work in parking garages, our goal is to explore similar motivationally focused solutions that may transform the aesthetic experience of Ohio State's parking garage to support suicide prevention more broadly for the University community.

Figure 3: Examples of Integral Ruedi Baur interventions in parking lots.

Methodology

To explore and rethink the user's lived experience in the parking garages, a three-week design sprint workshop with second-year students from the Industrial Design major within the Department of Design at The Ohio State University was organized. The immediate goal of this activity was to create an initial range of novel motivational strategies. Sixteen students were divided into 8 teams and were asked to develop disruptive ideas using C-K theory (Hatchuel, 2003) as their methodological framework. The proposals they were asked to develop had to align with the idea of a culture of care. The ambition of this disruptive innovation sprint was modest. The goal was not to define realistic or implementable ideas but to allow the research team access to ideas from which it would become possible to reflect on the qualities of the prevention strategies generated from an approach focused on experience design and motivational solutions.

Students were asked to research existing strategies that address suicide-by-jumping problems. Each student started by finding two strategies, one motivational and one coercive. This exercise introduced the complexity of the topic, while allowing the students to open their minds to the scope of innovative solutions possible. This activity also allowed students to better understand the distinction between motivational and coercive approaches, which is not always clearly defined. In the second part of the sprint, students were paired in teams and repeated the process to arrive at what they believed to be a disruptive idea. Again, they were asked to generate one idea adopting the motivational approach and one adopting the coercive approach.

Results of the design sprint were examined using inductive categorical analysis to distinguish their core properties (Paillé & Muchielli, 2016). As suggested by Paillé & Muchielli, this method allows solutions to be classified in types according to shared properties. Given the focus of our research, the analysis focused on the motivational interventions, as they are the ones geared towards the activation of the culture of care expressed by the university administration.

The analysis identified three strategies: Beautification, Activation, and Transformation of Use. To further examine the extent of those intervention strategies and the nature of their impact, a follow-up group of five undergraduate students summarized the key principles of these strategies and further developed visualizations to represent each type.

To gain input on the value of each type of intervention as a suicide-prevention strategy, a focus group with three topic experts was organized. The focus group was composed of a Clinical Psychologist, a Suicide Hotline Administrator, and Students Resource Monitor. The goal of this focus group was to challenge and receive feedback on the intervention typology before we moved our exploration forward. The panel of experts was asked to openly react to the students' concepts and share their professional opinions on the potential value and limits of each type of intervention. Their responses were later analyzed to precise the intervention categories and translate them into a typological model.

A typology of indirect strategies

Analysis of the design sprint activity and the focus group discussion led us to classify the various interventions proposed by the students into three different typological strategies: Beautification, Activation, and Transformation of Use. While there are some shared properties, each of these strategies presented specific perspectives on ways to activate a culture of care through place-making (Oldenburg, 1999). Moreover, each of these strategies demonstrates an ability to affect user experiences. Such experiences are threefold: somatic interaction, emotional reaction, and social engagement. Somatic interactions engage the user's physical senses (vision, touch, etc.). Emotional reactions engage the user's emotional expressions (joy, delight, self-worth, etc.). Social engagements foster connections to the community (exchange, cooperation, etc.).

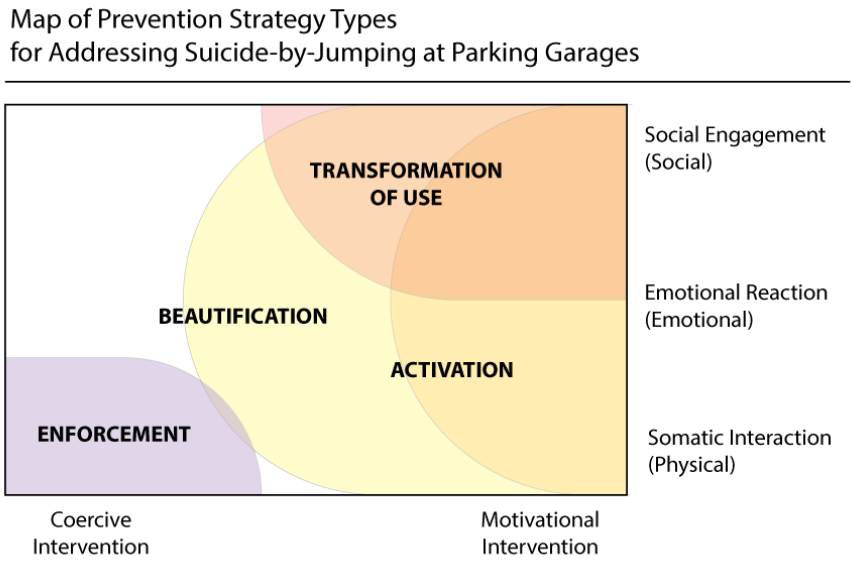

Figure 3. Conceptual map of motivational prevention strategies

Beautification

Beautification looks to address the neglected status of a typical garage—a status which inspires impressions of darkness, dirt, and depression. This strategy's primary aim is to seek significant improvement of the formal aesthetic quality of the physical space. Intervention examples would include applying color or graphics to the walls or floors, improving the lighting, adding an organic quality such as plants, installing or improving the seating, etc.

The Beautification strategy is the least engaging of the three since it relies primarily on passive emotional responses of garage visitors. This strategy also may overlap social engagement (the content of the wall graphics) or a somatic interaction (an interactive seating arrangement). However, this strategy seeks favorable responses from parking garage visitors that would be accumulated over time. Each time a user enters the garage space, they build a memory of it as a positive place. Due to the passive nature of this strategy, it may be considered a neutral intervention, nor solely relying on coercive or motivational interventions.

When presented with this strategy, the topic expert panel responded positively to the approach. One of them noted, "I like the softening [of a conceptual rendering], so it's not so stark and prison-like." Also, supporting that little interventions do help, adding that "anything to distract from their focus" will have a positive impact. Another noted that "30% of people don't actually want to talk to anyone." Added discussions reinforced that you

cannot tell people what to do, but it is important to say that you are not alone, saying "distract, then connect."

Figure 4. Example of student Beautification ideas (Pictured: Exterior of the parking garage covered in greenery to create a visually interesting wrap over the safety fencing on the upper levels)

Activation

Activation looks to address the individual user's internal experience, by focusing on users' feelings of disconnectedness and being "stuck in one's head." This strategy's primary aim is to be responsive to individuals in the garage. While activation can foster each type of engagement, the purpose is to create an emotional experience. Examples include a participatory installation that may use light and/or kinetic-based sound elements that respond to the individual's movement. While common elements (light, color, etc.) exist between the first two strategies, the key difference between Beatification and Activation is that now the materials are used within the space to acknowledge or respond to their presence/interaction. In doing so, it is *for* the person.

The Activation strategy's focus is to change the behavior of the individual by creating an alternative activity (if even for a brief time). The aim is to increase the time spent in the intervention so that individuals may have time to return to a neutral mental state.

A topic expert panelist responded to this strategy by agreeing that "I think something interactive is good." Another furthered, "the brain is connected to the body. It is all one." and "It's definitely a distraction … anything out of the ordinary." As the discussion progressed, the experts agreed that noise is a particularly good approach to helping people feel like they are not alone. Seeing that the conceptual solutions could reinforce a "web of connectedness" might help accomplish something that they do in therapy sessions, which is to get people to think about their future.

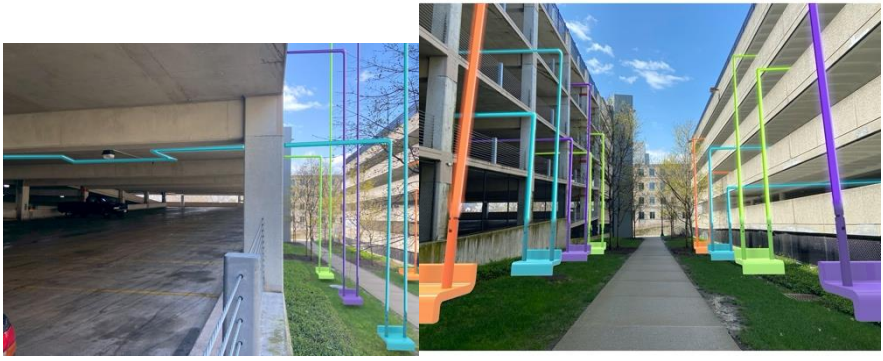

Figure 5. Examples of student Activation ideas (Pictured: Garage with brightly colored swings suspended from higher levels, to create an individual activity to prompt self-reflection)

Transformation of Use

Transformation of Use looks to address the shared (or group) experience by addressing feelings of isolation and loneliness. This strategy includes solutions that interact with others, are inclusive and public. Examples can vary from constructing a greenhouse on the top level to hosting food truck parties or creating 24-hour study spaces.

Regarding suicide prevention, this strategy is the most direct. It generates interactions with others, so that users are re-focused towards an entirely new (and possibly unexpected) social activity. How the space is transformed is not as important as why it is transformed. The use needs to support opportunity for social participation or interaction. Several types of interventions can include a wide collection of interactions: cooperation (i.e., food trucks), direct exchanges (i.e., study spaces), accommodations (i.e., stargazing lessons), and even moments for light-hearted competition (i.e., playgrounds). By using the Transformation of Use strategy, the garage becomes a place for direct human connection as well as general visual activity, which may circumvent a suicide-inclined individual seeking isolation. Topic experts saw concepts from this strategy as providing "another beneficial barrier." "Having things to do is cool, and playgrounds are a great way to activate a space—play is a really important thing for nostalgia." However, they did raise some questions about the types of concepts they were shown. Given that "high lethal [suicide prevention help] calls are during

the day, but they get more calls at night," the experts were interested to know how this space could be populated and at what times to ensure that someone is there to help.

Figure 6. Example of student Transformation ideas (Pictured: Top level of a parking garage with food trucks, sun screening, video boards and various seating configurations to create a social retreat from typical campus life)

A Critical Approach to Public Health Matters through Design

In a recent paper reflecting on the rise of social design, Alain Findeli (2017) suggested that the rise of designers' concern for the quality of people's experience of the artificial world has provoked a cultural shift in design practice. He suggests that with social design, the focus is on how people interact with their material and social environment. By considering the experience as important, designers are in a position to more holistically address and fulfill people's needs and desires. Through experience design, or design for experience to be more precise, products are no longer end in themselves, but are merely parts of an ecosystem of touchpoints embodying services that looked to fulfill people's needs or desires. The *people* these spaces serve are the ends in themselves. Incidentally, the quality of design projects depends on their fitness to users' capacities, values, and biography; users' understanding

becomes a crucial part of the design process (Proulx, Gauthier & Hamarat, 2020). This facilitates moving away from coercive-centric interventions (although coercion may remain relevant in certain situations).

Developing motivational preventive measures is a complex process that calls for the acknowledgment of diverse issues and forces. It is now widely recognized that context—the sociocultural reality in which people live—is a significant health determinant. Coincidentally, socio-cultural fitness must be considered important in the development of successful health and wellness strategies. Fitness is defined by how easily people can connect, appropriate, and understand the various touchpoints within which measures are at some point encapsulated. The development of socio-culturally fitted measures requires those involved in their design to account for the idiosyncrasies of social realities. Accounting for localized realities allows a more holistic approach to problematizing interactions between people and health measures. In other words, context awareness can emphasize quality or aesthetics of the user experience as a matter of concern, launching innovative ways to think about how to motivate people to adopt healthy behaviors.

One source of inspiration for this problem's motivation strategy can come from understanding what fosters participation in public places. Through a series of collaborative design workshops with older adults, a recently completed study (Fromme, 2018) sought to identify key characteristics that motivate individuals to participate in public places. The resulting Age-friendly Framework for Public Places identifies four key design qualities that motivate participation: Approachability, Intuitiveness, Equitability, and Value. These qualities can be viewed as desirable characteristics that may be used to counter the coercive effects of structural installations. Additionally, Cox et al. (2013) identify approaches to prevent suicide-by-jumping impulsive behavior by (a) restricting access through physical barriers, (b) encouraging help-seeking, (c) increasing the likelihood of intervention by a third party, and (d) encouraging responsible media reporting. Intervention by a third party generally is interpreted as a police or security presence. However, by broadening these approaches to their intent, one can imagine their application to the various intervention strategies named in this study, such as using the top level of a garage for food trucks (and the people that come with them) to address impulsive behavior.

Conclusion

Upon completion of this research, one of the student researchers contributed this reflection:

"From a student perspective, this project offered an opportunity to explore how design can make a meaningful contribution to complex and wicked problems. Specifically, the outcome of our research taught me the importance of designing for intention and joy in the every day. I learned that the world we inhabit is meant to be thoughtful, caring, and intentional and the design of the built world should reflect that."

This project sought to explore new strategies to address a pressing issue on the campus of The Ohio State University. We are trying to examine how to leverage design as a critical voice to suggest potential ways to activate a culture of care. Interestingly, we came to acknowledge that disruptive ideas can be those that no one will notice. By changing the prism through which the problem is being examined, we make ways for critical perspectives. Obviously, this research must be regarded as explorative. No claims can be made about the potential empirical impact of any of these motivational strategies for suicide prevention. But this type of work could be later initiated by refining the prototypes to a form that would allow comparing the difference between expected and observed somatic, emotional, and social behaviors.

Drawing on recent experiences that mobilized design to address social problems, our practical proposition is to engage designers to envision the design of a world less prone to suicide. From a scholarly perspective, we sought to contribute to the question of how design can have an agency in wellness and suicide prevention. In other words, we sought to provide evidence of the type of conceptual thinking that may arises from engaging designers in the development of measures contributing to the establishment of culture of care. The resulting student-designed prototypes provide an array of novel peer-directed motivational designs that validate this approach and contribute to this important discussion.

This project is connected to a larger discussion about the roles of evidence-based practice (EBP) and the design approach. It is necessary to acknowledge that EBP offers important validation; however, for time-sensitive topics such as suicide prevention, the implementation of this approach is relatively slow and provides incremental change. In contrast, the design process can supply forward-looking strategies that often are considered innovative by noticeably closing the gap between “the known” and “the needed.” This mindset of design thinking needs to be applied to broader conversations, such as the one addressed in this paper, where proven strategies are sometimes inadequate. More urgently, in addressing complex problems such as suicide prevention, both strategies need to work in tandem. This study shows how expanding from of the traditional strategy of coercive interventions to several types of strategies that include motivational interventions (applied to somatic, emotional, and social experiences) means that both approaches can share responsibility for the common goal: establishing a culture of care in addressing future suicides by jumping.

About the Authors:

Sébastien Proulx is Associate Professor and Coordinator for the Industrial Design Major at The Ohio State University. He holds a Ph.D. in Design from the Université de Montréal and is a founder member and currently Co-Director of the Ohio State DESIS LAB.

Adam Fromme is a Lecturer in the Department of Design and the College of Nursing at The Ohio State University. He holds an MFA in Design from Ohio State and is a member of the Ohio State DESIS LAB. Additionally, he serves as Co-founder and Principal of The Center for Inclusive Aging and Design Research.

Leila Akberdin is a fourth-year undergraduate student pursuing a degree in Industrial Design with a minor in Humanitarian Engineering at The Ohio State University.

Maria Basile is a fourth-year undergraduate student pursuing a degree in Industrial Design with a minor in Humanitarian Engineering at The Ohio State University.

Olivia Forsyth is a fourth-year student at The Ohio State University pursuing a degree in Interior Design and a Social Psychology & Personality minor. She is also an Interior Design Intern with Ohio State's Facility Planning & Design Department.

Maya Jenkins is an MFA candidate in Design Research and Development at The Ohio State University. She holds a Bachelor of Arts in Communication Technology and New Media with a specialization in Human-Computer Interaction.

Abby Nelson is a fourth-year undergraduate student pursing a degree in Social Work at The Ohio State University. She is also a Pre-Law student, minoring in Legal Foundations of Society.

Claire Spicer is a fourth-year undergraduate student pursuing a degree in Visual Communication Design at The Ohio State University.

Acknowledgements: We would like to thank The Ohio State University, College of Arts & Sciences, Global Arts and Humanities Discovery team for financing this project. We are also grateful to Associate Professor Susan Melsop for her contribution as co-teacher of the Collaborative Studio in which part of this research was conducted, as well as for all students enrolled in the studio.

Abstract | In 2017 the City of Florence started to sketch out the application for UNESCO Creative City for the Craftsmanship, opening in 2019. The application was not selected by the Italian National Commission UNESCO.
However, the challenge made it possible to put at the center the physical city and citizens.
Contrary to what we thought in the past, the digitization of cities has increasingly turned out to be a not entirely democratic tool because it is often out of the control of its inhabitants. With the advent of the digital dimension, cities are constantly "measured" with different parameters to enter the rankings capable of expressing their qualities (technological equipment, quality of life...). Even this long path, in different aspects, began with a competitive spirit, gradually revealing elements of an extremely complex structure that led those who followed the candidacy to cross real data with the internal and external perception of the city. Often they did not correspond to the numbers of the smart city.
The project involved a large number of stakeholders who related in different ways than usual, managing to define the elements on which the projects were developed.
The experience, although not having had the desired result, was nevertheless able to highlight how consolidated but not clearly perceived values can be made to re-emerge and help design a new development model.

KEYWORDS | CRAFTSMANSHIP, IDENTITY, CREATIVITY, CITY, PARTECIPATION

1. Introduction

The expression creative city was first used by David Yencken in 1988 in the historic Australian literary magazine Meanjin, a name derived from aboriginal words. Yencken, professor of architecture and planning at the University of Melbourne, supports the importance for a city of not only being efficient and fair, but also promoting places for creativity and exciting experiences.
The theme is then taken up by Charles Landry, as regards economics by John Howkins, and by Richard Florida who elaborates the concept of creative class. With these studies we begin to consider creative activities, not restricted only to cultural artistic activities but more generally to who economize with their own ideas. If it is the people who make the difference, in a Human center vision, the city, understood in its most generic definition, must be able to encourage creative activities through suitable places and initiatives.
UNESCO in 2004, opens the calls for applications for creative cities by classifying them in seven categories: Music, Literature, Craft and Folk Art, Design, Media Arts, Gastronomy and Cinema.
Creativity is therefore associated with artistic activities with a space for technologies (albeit not primary) and no reference to science, referring to the fact that creative activities are traditionally connected with an artistic and technological innovation closely related to the concept of culture.
If on the one hand, therefore, the concept is circumscribed, on the other hand it is placed side by side with a model of sustainable development ensuring that there is no overlap with the cities that are world heritage sites; for these indeed, the purpose is «the protection and the transmission of future cultural and natural heritage» (https://en.unesco.org) while the network of creative cities promotes cooperation between cities «that have identified the creativity as a strategic element for sustainable urban development» (https://en.unesco.org). It is not therefore, a recognition of the goodness of local creativity but of how it is capable of triggering actions among at a sustainable development that can be connected, even if only in part, with the starting creative sector.
A way, therefore, of conceiving creativity and the cultural industry in a strategic sense, not only as a competence, and know-how.

2. The vision of the creative city

The research group headed by the Design Laboratory for Sustainability of the University of Florence, as a first action, tried to decline the theme of the creative city on the reality of Florence and, subsequently, identify which planning the path for the candidacy could have to contain.
The three T's identified by Florida - talent, technology, tolerance - turned out to be attractive and adapted to the urban reality we were working on, but the whole theoretical vision did not seem to help the path; in particular, it made us reflect the insistence on the concept of class. In short, we didn’t want in any way to favor the transformation of creativity into merchandise and therefore Benjamin Barber's words sounded like a warning.
However, if it is the ruling class that chooses a place, uses it, consumes it, transforms its image according to its own needs, the disputing sense of the operation could have been

precisely that of bringing out the people and their works which, despite being important for the city are not class and are not dominant.

According to Benjamin Barber, however, «culture is 'built by consumption' as much as by production. Consequently, through the 'creativity of consumption', the homogenization of the dominant culture can be colonized and re-transformed into cultural peculiarities» (Barber p. 382).
How to do so that the creative culture is original, identity, not dominated by the culture of consumption.
Barber writes:

> "In fact, the restoration of a condition of healthy pluralism, where human values are manifold and the material consumption is only one in a cornucopia of human behavior, will require a social therapy that cures the civic schizophrenia that defines us, a civic therapy that restore the balance between private and public by giving our public civic Selves a renewed sovereignty over our private consumer Selves and placing the destiny of citizens before that of the markets. This implies a return of capitalism to its primary function as a productive and efficient system that addresses real economic needs not on the basis of supply (push) but demand (pull), and the restoration of democratic public life as a supreme system regulator of our worlds of life, of which the market is only one among many" (Barber 2007, p. 378).

By choosing to submit the application for Florence as a creative city for crafts and popular arts, the municipality intended, more or less implicitly, to attribute to the artisan reality the possibility of triggering virtuous projects with regard to sustainability in its forms - social, environmental cultural - and therefore to be able to re-propose an urban model where artisan production is a founding element, where creativity is a value and not a privilege, a tool to create better conditions for citizens and from a social point of view, environmental-cultural and economic.
But why is Florence a creative city? There are many different answers and not all of them can be expressed with the same clarity and determination. Among these certainly the fact that craftsmanship represents the meeting of different knowledge and disciplines, continuously contaminating itself with art, architecture, theater, literature[1].
Florence is a traditionally artisan city that founded this heritage starting from the Guilds of Arts and Crafts, on which the social and productive structure has settled, which, with their abolition of 1770, saw its powers transferred to the Chamber of Commerce, Arts and Manufactures (Gandi 1971). Today to the traditional processes are flanked the fab labs of the new makers, the new forms of social entrepreneurship that often combine traditional processes with tools for communication and digital manufacturing. The large and complex network of artisan businesses with a predominantly traditional approach operates on

[1] We can think of the artisan workshops project of the choreographer Virgilio Sieni

different knowledge, techniques and materials that materialize in the various production sectors: leather, wood, precious metals, ceramics, weaving, hard stones, flakes and gilding, all having an important role in restoration techniques (Tofanari 2015).
Once identified the reasons that allowed to positively evaluate the presentation of the candidacy, it was necessary to answer what are the objectives to pursue through the candidacy, why is Florence applying? Among the main purposes there is to bring out and share what exists in the field of artisan creativity through a path that involves the major stakeholders of this sector: from artisans, from trade associations, to schools passing through administrations, event organizers, and foundations.

3. The reality-Florence

Florence has worked hard in recent years to increase its reputation as a contemporary city, managing to address some of the most pressing issues of medium and large cities. At the same time to enhance its historical-artistic identity more and more current.
Since 1982, the historic center within the walls has been registered in the World Heritage Site, one of the most prestigious and historically consolidated UNESCO awards.
It is among the cities with the longest life expectancy and good health and social care services (https://www. Osservatoriosullasalute.it/ Osservasalute/rapporto- Osservasalute-2016). It is firmly at the top of the European Union ranking as Cultural and creative cities in 2019 for medium-sized centers (https://publications.jrc.ec.europa.eu/repository/bitstream/JRC117336/citiesmonitor_2019.pdf)
It is the second smart city in Italy according to ICity Rank 2019 (https://www.ingenio-web.it/25527-le-prime-10-smart-city-di-italia-secondo-icity-rank-2019)
The Time magazine puts it in first place for the most loved city in Europe.
It is the fifth green city in the Legambiete ranking for 2020 (https://www.legambiente.it/wp-content/uploads/2020/11/Ecosistema-Urbano-2020.pdf).
The complexity of the indicators of each of these categories is really high and the administrators know that each of these brings national and international visibility.
From a census carried out on the basis of the candidacy, it was possible to verify that there is a high concentration of shops and artisan workshops inside and outside the historic city and that these must face important problems in relation to the economic stability of companies. But these problems, for most of them, are not solved by becoming self-promoters through new communication channels, not by becoming masters for largely foreign apprentices. There is therefore a resistance to transformation, a perpetuation of traditions not only in the manufacturing processes but also in the mentality that changes very slowly: even in the meetings the artisans have affirmed the attachment to their work as a discipline of doing and the reluctance to want to transform themselves in communicators or masters. This almost hidden artisan practice, certainly not exhibited, had to emerge out of respect for the artisan mentality, and in some way flank the reality of Florence, a place of the Renaissance as it is told in an effective, albeit simplified, way in *The geography of genius* (Weiner 2017). How then to express the artisan identity of the real city?

At the time of the candidacy, Carrara, Fabriano were the only other Italian creative cities for the Craft and folk art sector. Definitely smaller cities and with simpler identities where it is

easy to combine the name of the city with one, and only one type of processing. In other areas we had Rome, Milan, Turin and Bologna which for many characteristics could be comparable to Florence. There is no doubt, however, that UNESCO's policy in recent years was to reward small towns to enhance their excellence within an international network and make them more recognizable and visible.
What visibility was Florence looking for? or rather what visibility did it need? If indeed Sheki or Baguito City they can express their artisan identity even with just an image but they are not known globally, for Florence the exact opposite was true.

Figure 1. Tourists in Piazza San Giovanni

Furthermore, precisely in comparison with the rankings compiled by the various bodies and institutions, this recognition was able to express a more real and permanent character: how little does it take for a city to rise or fall within the livability ranking? how many extremely serious but unpredictable facts can shift positions? and again: can the work of an administration and the commitment of its population really be evaluated as such volatile parameters?
And how much does entry into these rankings depend on the management of data that is outsourced? and for this: how great is the desire not to give up power in exchange for necessary and strategic services?
It is also in this sense that the candidacy was carried out to affirm historical skills and realities but at the same time capable of great innovative potential with an authentic and non-transferable location.

Craftsmanship as a strategy to regain sovereignty over the place between the modernity of a technological matrix and a past of great importance.

4. The concept of Territorial Identity

The competition of a territory is increasingly played on two different levels but decidedly complementary: the global and the local one. The first allows companies a strategy extended to the world scenario in the search for services, suppliers as well as markets; the second commits companies to find in the local context those elements that allow them not to "homologate" their business with those carried out in other parts of the world, taking root in the territory and assuming an identity that cannot be replicated.
The two strategic dimensions are absolutely and necessarily complementary, so much from having favored the creation of the term "glocalism" (Senn, 2007)
The rapid progress of globalization has resulted in strong competition in every country, every city and every region that find themselves "fighting" to win their own share of consumers, tourists, investors, students, entrepreneurs, sporting and cultural events international media, and for the attention and respect of the international media, other governments and people of other countries (Anholt, 2006). The need to cultivate the roots in one's own territory of belonging has once again emerged strongly: tourism has favored communication investments in the micro-territorial dimension and has produced, with the creation of sporting, musical events, festivals, etc. who in this context are encouraged to review their communication strategies to try to go beyond the dynamics of internal community services, towards a narrative that favors the promotion of new attractions.
In the commercial field, the 'good name' of the brand is a precious asset for producers, an asset that allows the company to compete and win with the other millions of almost identical products on the market. Applying brand concepts to land management means understanding that each location needs to manage its own internal identity and external reputation. Every place on Earth has its own reputation, just like companies and products, which can be simple, articulate, predominantly positive or predominantly negative, and this reputation influences how people perceive a country, how they behave and they react with respect to what this produces: German engineering, French elegance, Japanese miniaturization, Italian style, Swedish design and Swiss precision are all values that are transferred to the products arriving from those countries even if the guaranteed qualities since made in are nowadays purely symbolic.

Figure 2. leather craftsman at work

Simon Anholt, an expert in places and perception, argues in Places: Identity, Image and Reputation, that public opinion very often tends to be superficial and therefore to work by cliché, by stereotypes. The image that others perceive is often quickly transformed into what is defined as "reputation". And reputation is about identity and values. It is therefore necessary to start behaving and acting in order to be able to influence the way in which one is perceived, as Socrate argued stating that «The best way to earn a better reputation is to strive to be what you want to appear»

On the basis of Aaker (2001) and Aaker and Joachimsthaler (2000), place brands have been defined as representations of place identity, building a favorable internal (public, private and civil society stakeholders) and external (tourists, investors, traders, migrants) image ', leading to brand equity; that is, brand satisfaction and loyalty; name awareness; perceived quality; and other favorable brand associations (that is, positive image and reputation) attached to a name or symbol representing a country, city or region (Govers and Go, 2009, p. 17)

Places are definitely very complex “objects”. Often the mistake is made of treating the city or region as a product since environments develop in places that allow products to be brought to international markets, to market tourism products, investment opportunities, cultural offers, job opportunities and offers of international study programs. But places are also spaces where people live, where they move, where they educate their children, enjoy their work and free time and think that the awareness and reputation of all this can be influenced by the use of a logo perhaps it is a bit simplistic.

Does all this mean that logos and slogans and identities are completely useless? No, of course. Logos and slogans play an important role in supporting a territory which, by proudly referring to its origin, will increase awareness and its communicative strength. However, if it is not only the symbol that builds reputation, it is certainly the symbol that can become an icon for an existing reputation built scrupulously over time and it is the identity of a territory that is able to create added value for global competitiveness by helping to activate a virtuous cycle of development.

This ideal path, thus, has been followed for the preparation of the application, trying to build an authentic reputation by working in full respect of our own identity and not by

building from scratch something that has nothing to do with our own nature, but remodeling the purpose that it has, on the basis of a better and more positive perspective[2].
The complex richness of the artisan culture and the lack of a solid reputation emerged from the major weaknesses: "Florence was able to apply for all categories". This sentence is pronounced by one of the stakeholders who took part in the participatory path, reinforces what has been previously expressed: a complexity that goes far beyond the artisan sector, a perception not decidedly oriented towards craftsmanship (Anholt 2007). The sentence reveals what, following the failure, can be called an optimism and an overconfidence that has made the status quo judge significantly positive so as not to have given importance to the need for changes to achieve the goal and not to I have had goads pointing to this (Thaler 4014).

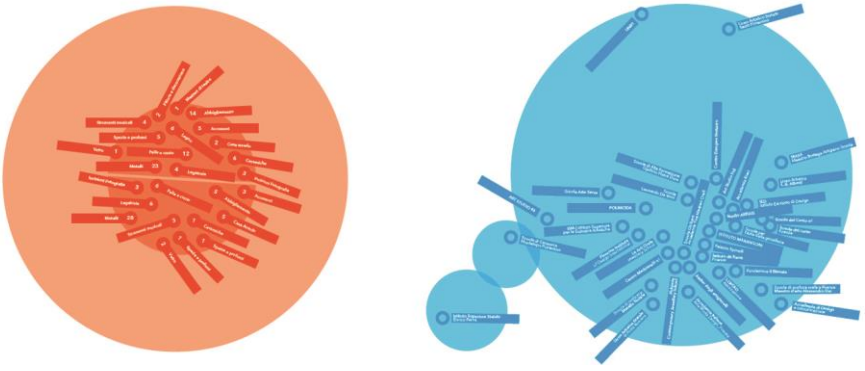

Figure 3. Density of artisans and creative schools in the city

5. Perception and Partecipation

There are various 'image formation agents' (Gartner, 1993) that influence the way people understand the world. The most important agents that form perceptions in people's minds are, of course, their own experiences (also called organic agents), followed by word of mouth about the experiences of colleagues, friends, relatives or otherwise connected contacts (called social agents).
We must never forget those who live in the places and their active role in the territorial management process: a good brand strategy should be built on the basis of the sense of belonging and shared objectives, factors that generate a link that is difficult to reproduce or imitate.

[2] It is worth mentioning the thesis of Eliana Dedda, Logo place. Territorial brand and procedural evolution in the visual translation of complex identities, Master's thesis of the Polytechnic of Milan, School of Communication Design, year 2013-2014, supervisor Francesco Ermanno Guida.

The entities and institutions that work on crafts in Florence are many; just as there are fairs at national and international level. An articulated and complex fabric both from an institutional and product point of view. An artisan area was not chosen but artisan knowledge as a whole. If Carrara is a city of marble, if Fabriano is a city of paper, Florence is the city of goldsmiths, leather, straw, carvers and gilders, stone, ceramics, and fashion and the choice could not fall on a sector only by virtue of the calculation of the higher turnover.
Therefore, choosing to nominate Florence not for an artisan sector but for all the artisans as a whole, was a choice that certainly didn't facilitate communication with the evaluators but, precisely by virtue of the authenticity of the message sought, it appeared essential.
Distinguishing what was and wasn't perceived, what is the reality, occupied the first part of the time of the path; the second part concerned the definition of the vision and the mission of all the work.
Re-starting from the net, knowing and sharing the existing was the first important goal.
The role of the stakeholders is to be considered fundamental in all participatory processes. Following the classification proposed by Rossella Sobrero, the stakeholders were placed in a map that was able to summarize those involved in craft activities with different roles (Sobrero 2018).
Operational stakeholders are identified with the craftsmen; institutional ones with representatives of administrations, the key stakeholders represented by trade associations, organizers of events dedicated for the part of the training chain, the foundations, and with marginal stakeholders part of the training chain not included among the key stakeholders[3].
At least the 'operational' and the 'keys' have been seen to belong to the community of interest and purpose (Manzini 2018).
The key stakeholders have filled a form to collect information about their skills, the inclusion of their structures in national and international projects, the initiatives they promoted and in which they took part, the suitable spaces they had for activities to be played.
Just from the reading of the documents and from some meetings with the artisans, a composite panorama emerged, consisting of small companies able to make important sales, which, above all, acted as custodians of a material culture of inestimable value, understandable only through the immersion in the environments and hardly returnable through simplified narrations. From what was considered a first census, the strategic role of creativity emerged.
"Knowledge and culture are nodes of networks that feed a new tertiary social composition on the territories, widespread in the productive activities in the craft sector, involving the high education present on the area" (Bonomi 2014 p. 36).
One of the peculiarities of Florence, that has been highlighted, is that of having on its territory a very high number of schools dedicated to creative training (only 40 universities are American). Design students from the University of Florence, ISIA, Academy of Fine Arts and IED were involved in the final stage of preparing the application to give shape to the project proposals.

[3] Rossella Sobrero divides the stakeholders into four groups: marginal, institutional, key, operational. Although the text refers to business contexts, however, the division between the stakeholders seemed to be able to be transferred to the reality described.

6. Project for the candidacy

Joining the network of creative cities has no economic recognition, and membership in the network is subject to periodic checks which could also lead to the exit of members. It is an important commitment that involves the implementation of three local projects and three aimed at the international network. If the former mainly expressed, they were the first to express the wishes of the world of craftsmanship which saw a great opportunity to carry out even ambitious projects, with the second it was the whole city that put itself on the line that it shared with the other members of the international network what original contributions Florence could offer.
Among the requests of the call was to develop the application through a participatory process. The number of stakeholders involved was different, however it would be incorrect to say that a bottom up formula was applied: it was a formula that brought together some elements not only with interests but also with great planning but it was not a path that it started from the bottom and this is partly due to the structure of the UNESCO demand.
The candidacy, in fact, which must be presented by the mayor, was followed by the Councilor for productive activities who instructed the Department of Architecture of the University of Florence to structure it. Another point of reference was the Municipality Office dedicated to UNESCO World Heritage Site.

About 100 people representing administrations, trade associations, associations, artisan businesses, hubs and makers. The method adopted in these two meetings is inspired by Open Space Technology (OST - Open Space Technique), a tool that, thanks to an atmosphere of informal relationships and a solid structure of the works, maximizes the active contribution of the people who participate. Eight topics for discussion were discussed during the days[4] from which the traces of the six projects emerged to which the students of the creative schools, as mentioned, gave shape.

[4] - The places of craftsmanship
What are the most significant places of Florentine craftsmanship? What are the places that, although less visible or known, have a potential to express?
- The actors to be involved
Which actors or categories of actors could it be strategic to involve in local and international actions?
What strategies to adopt for the involvement of the actors?
- Telling the past, acting on the present,
design the future
How to foster a narrative that intertwines the past, present and future of craftsmanship in Florence?
How to relate the future with the artisan tradition of Florence? What are the most interesting strategies and cases?
- Relationships between different practices and knowledge
How has interdisciplinarity been and can it be an added value for Florence?
How can this added value emerge? What are the most interesting experiences?
- Awareness of the value of heritage
cultural artisan and popular art
How to create greater awareness in Florentines of the value of cultural heritage linked to crafts and popular art? What are the most interesting strategies?
How to communicate this value also to those who do not belong to the local community?
- Feeling part of a city of craftsmanship

The decision to conclude the course with the contribution of the students was chosen for two reasons: the first was to represent the Italian and foreign students who are part of the urban community of the city and who characterize it, the second was to have a feedback with the young generation on the work done and possibly be able to change direction.
Just as the artisans focused on the local dimension, the students gave international breath to the proposals by reiterating that citizenship is not by birth and that, at least in ambitions, it is a concept that has at least extended to Europe.

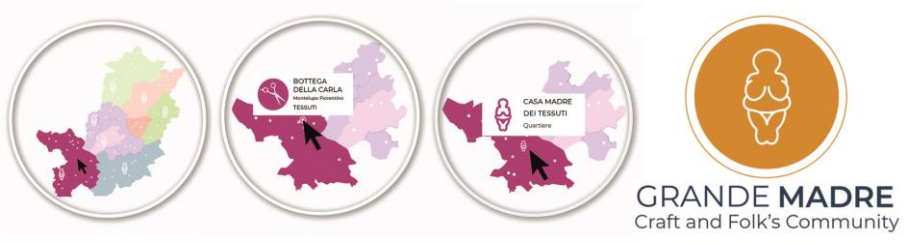
The six project themes that were proposed to the commission were the following:

- Mapping - Census and digital mapping of all the realities related to the world of craftsmanship in the metropolitan area - creative ecosystem.
The result had to be that of creating a digital and "physical" map of the artisan ecosystem. The map is continuously updatable and digitally updated and where every stakeholder involved can add documents and information to contribute to the construction of a shared narrative of the metropolitan city. The goal has been pursued and today there is an active network where artisans of the old and new professions can voluntarily register and have a space available.

- Strengths of networking - bring out the creative ecosystem and event creation capable of representing it.
Although Florence has been home to an international craft exhibition for more than eighty years, it was considered by many stakeholders that it is a formula that is no longer capable of satisfying the visibility and attention sought by artisans on its own. The proposals went from the Fuori Mostra to a physical place where to exhibit in conjunction with the city's attraction events. This was the hypothesis that prevailed and the creation of a pole that also achieves the objective of the second point is the path that the administration is following.

- Safeguarding Inheritance and building the future - the construction of a digital and material archive to collect all the corporate assets and put them in part for free consultation. This project, which from a physical point of view was linked to the previous one, among the three, was the most demanding for two reasons where the first was of an economic nature for the preparation for physical archive locations, the second, even more important that he saw the artisans willing to share not only with the competitor but with the world part of their identifying elements and in many ways unique.

How to foster a closer relationship between craftsmanship and population? What are the most effective tools and strategies to spread the identity of the artisan city among the population?
How can craftsmanship be a vehicle for promoting new lifestyles, which make it closer to people's daily lives?
- Tradition and innovation in production
What elements related to innovation can be strategic in the elaboration of local and international actions?
How can the preservation and respect for the tradition of production processes be reconciled with technological innovation?



On international projects, the start was to highlight the many relationships that bind Florence to international networks of municipalities, from twinning to the most recent networks.

- Competitive Identity and Know How Alliance - starting from the competitive identity, the objective was the overlapping and integration of the UNESCO creative cities network with the existing networks to which the city of Florence adheres: twin cities linked by friendship pacts, the network of UNESCO World Heritage sites, the Unity in diversity network. The materialization of these bonds was given by objects that were built passing from one city to another until it was completed.

- “Creativity" in-residence - Combination and exchange between artisan enterprises of the network I unite with the aim of innovating and contaminating the different shop models. The Erasmus of craftsmen has been defined where the Erasmus model recognizes the ability to unite and increase the ability to understand others. Here too, on the model of residences for artists, dedicated in particular to performers, the administration is equipping spaces for artisans.

- Sustainability contest - Creation of a competition between the schools of the creative cities on crafts as a model of sustainability that generates a digital exhibition and a traveling exhibition between the participating cities. The competition is a way to promote a production model but also a socio-cultural and environmental one.

Projects therefore feasible so much so that the city, even though it has not entered the network, is implementing them; differently ambitious projects but above all projects that have tried to respond to the needs and desires of those who study, produce and work in the creative field of craftsmanship.

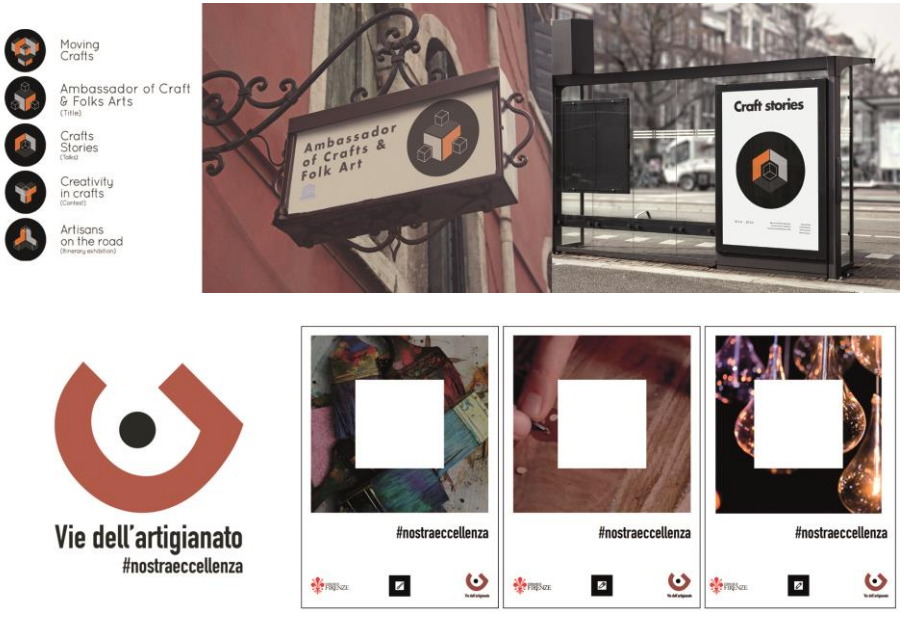


Figure 4. Some concepts of the creative students of the final workshop

5. Conclusion

The candidacy for creative city cannot be said to have been a useless experience in the first place because the city is working in the right direction.

But we must reiterate that perhaps the deepest reason that allowed it was the search for an identity that was independent of both the assessments of technological networks and the reputation of a Renaissance city and, consequently, a city with a significantly linked economy. to tourism.

Logos and slogans can help raise public awareness, but identity is not just something to put in the corner of the advertising page or on business cards: only if local businesses, cultural organizations, tourism businesses and individuals, they will constantly engage in referring to the territory with pride, raise awareness, and can impact reputation.

From here and from the desire to tell not only the material but also and above all the immaterial, virtual storytelling paths will develop that will find fertile ground in digital applications that combine storytelling and information, tradition and technology.

So, strategy and substance first, then the rest.

Abstract | Triggered by the strategic use of filming locations for city branding, and with a specific focus on Istanbul, this research investigates the role of movies on shaping the image and perception of cities. It aims to consider how a city is depicted in different movies/genres and discuss how such representations affect the traditional image previously constructed through the cultural heritage and the built environment. Through the analysis of twenty-one international movies that were produced between 2000-2020, and were selected out of 3586 movies, the comparison of fictional layers with the traditional tourist attractions of the city were carried out. This research approaches Istanbul's urban visual culture and its many meanings, through Lynch's aspirations for imageability, visibility and legibility in the design and perception of urban environments. The findings underline the influence of the film industry on city's branding processes and perceptions through representations and imaginary layers.

KEYWORDS: SOCIAL NETWORKS, INTERACTIONS, DESIGN HUBS, CREATIVE COMMUNITIES, INNOVATION

1. Introduction

Design cultures are defined as the emergent patterns during design activities that encompass vision and values, enable conversations and eventually shape the future of our existence (Manzini, 2016). Despite acknowledging the expansive discourse on the meaning of design cultures, Manzini (2016) underlines the lack of cultural dimensions within the debate on design that relate to environmental, economic, and social issues, and point out the serious limitations that prevent design cultures from being agents of change. To strengthen the change agency potential of design cultures, their essence needs to be examined from these perspectives. In this study, we explore the social interactions that enable designerly ways of thinking and operating, by taking a co-creation hub as a qualitative case.

One of the defining features of design cultures can be considered to be creative interactions it gives rise to and is shaped by. Creative thinking is a prerequisite of design-based practices (Perry-Smith & Shalley, 2003; Brown, 2008). Although creativity is often considered to be an individual merit, scholars argue against this Platonic view that suggests that creativity is a personal characteristic one is born with, rather suggesting it is an outcome of the interactions between the actors of a system (Albrecht & Ropp, 1984; Nemiro, 2002). It is defined as "the creation of a valuable, useful new products, services, ideas, procedures, or processes by individuals working together in a complex social system" (Woodman et al. 1993, p. 2). Indeed, the quality interactions can have a fundamental effect on creative output- For example, in his comprehensive study on the creative peaks of 41 artists from 19th and 20th centuries, Accominotti (2009) discovered that creativity occurred regardless of age, background or education level of the painters but was tied to their involvement in various art movements, which required them to come into interaction with other artists. The art movements that in a way functioned as communities, where ideas were openly discussed and challenged, facilitated the necessary interactions that trigger creativity of the artists.

However, human relationships are complex as there can be interactions in multiple natures occurring between two individuals. Each of these relationship natures form a different network within the same community. (Monge & Contractor, 2003). This refers to the multiplexity of networks, which is the multitude of relationship forms contained in a tie between two members (Cardillo et al., 2013). This means, for example, two people can design a product together and be friends at the same time. The extent of their interactions influence their creative output and, consequently, the narrative of the community they belong to. Social network analysis is a useful tool to investigate such layered social structures that are a result of these complex, multi-layered relationships (Knoke & Yang, 2008). Performing a multiplex analysis of networks provides a holistic interpretation of the impact different relationships have on each other.

The importance of providing possibilities for maximization of interactions is a widely acknowledged aspect of triggering creativity that forms the core of design-based interventions (Csikszentmihalyi, 1997). In professional environments such serendipitous interactions often need to be facilitated to form the necessary dynamics to maximize the potential. This is, in essence, what many innovation hubs aim to do – support creative connection across individuals and groups. Despite the unpredictability or serendipitous interactions, networks are affected by certain routines that are practiced within the community, as well as the operating mechanisms behind the community. Therefore, studying the networks through mapping multiplex interactions among the actors in a creative community helps understanding the favorable conditions and limitations towards the formation of a fruitful ecosystem, and aims to investigate how social interactions in creative communities enable rich design cultures.

2. Methods

The social network analysis presented in this paper derives from a dataset of structured interviews with 35 members of an interdisciplinary co-creation hub that consists of designers, researchers, educators, project managers and technical staff. This community of the Co-creation Hub (pseudonym) were asked questions regarding their collaborations and connections with the remaining members of the community from creative and informal perspectives. The nature of social relationships is defined through their content. Relationships that carry the potential to lead towards a creation of newness in form of knowledge or artifacts fall in the category of creative relationships. Informal relationships on the other hand are defined as kinship, friendship, sharing leisure time and having commonalities besides the professional work environment (Kratzer et al., 2005).

2.1 Research Context

The interdisciplinary Co-creation Hub that is subject to the network analysis presented in this paper is located within a public research university in Finland. Founded over a decade ago, the internationally acknowledged hub accommodates interdisciplinary project courses with challenges brought by industry partners, fostering collaboration across disciplines and between students, industry and academics. Throughout the years, based on research and experience, the premises of a re-purposed research lab building have evolved in a way to maximize interaction, hands-on experimentation, collaboration and research. In addition to a variety of prototyping opportunities, the building also offers flexible work spaces. The hub operates in a self- sustaining fashion, where members of the community share the responsibilities to keep the premises functioning.
The community comprises three broadly defined, interdependent categories of involvement. Teaching staff, who are also responsible for scientific output, technical staff, who are responsible for operating the prototyping facilities and organizational staff, who are

responsible for project management, communications and relationships with the other hubs in the network. Apart from these three employee groups, the hub also hosts community members who are not employees, but are involved in ongoing projects. This paper looks at the employees and guests and considers them as 'regulars' of the community. There are also students, visiting teachers and entrepreneurs who benefit from the facilities, but they are not taken into account in this paper, as they do not have a continuous relationship with the rest of the hub.

2.2 Data Collection

The collection of data consisted of structured interviews with 35 (n=55) members of the community, where sampling was focused on equal representation of each category of employment (teaching, technical, organizational), age group, gender and the years of involvement in the hub.
The interviews were conducted individually, and lasted from 28 to 95 minutes. The participants have received the identical set of questions, as well as a brief before the interviews, as none of them had prior knowledge about Social Network Analysis (SNA).
The interviews started with a set of introductory questions that focus on the role and the experience of the participant within the community. Later, the interviewees have been asked to identify the people they collaborate on a creative nature, as well as the people they have informal contacts with, having a list of people in the community in front of them. The participants were given examples of relationships that might fall under each category for inspiration. Additionally, the participants rated each relationship they reported on a scale of 1-5 considering its average frequency, duration and depth. And last but not least, the participants were asked to provide an example of a low-ranked (rated 1-2) and a high-ranked relationship (rated 4-5) for both relationship natures.
The reliability of participants' ratings was analyzed through comparing how different sides of dyads had rated the relationship. This suggested consensus among the strength of the relationships. The answers were anonymized and transferred to Gephi software to create network maps in order to analyze community dynamics.

2.3 Data analysis

Social Network Analysis (SNA) is most frequently applied within the field of organizational management for seeking answers to various problems such as improving collaboration, finding influencers, leadership development, performance enhancement and integration of units (Borgatti & Foster, 2003). Despite being a mathematical analysis of relationships, SNA commonly provides visual material (network maps) that represents these relationships. However, 'reading' these maps and interpreting the meaning behind emergent patterns that describe how networks behave does not always require statistical approaches. When combined with the thematic analysis of the interviews (Bansal & Corley, 2011), the maps have the potential to provide in-depth insides that statistics cannot explain (Scott, 2012).

Therefore, in this study, we made use of a combination of analysis techniques in order to paint a complete picture.
The relationships and their ratings collected with the interviews were transformed into maps with the standard tools and plug-ins available in the open-source software Gephi for representing and analyzing networks. In our study, we utilized the measures of degree, density, centrality and modularity. In addition to utilizing a variety of measures, we have also utilized two different force-directed layout algorithms that are available within Gephi software, Fruchterman Reingold and Force Atlas specifically, in order to achieve meaningful visualizations.
The interdependency of creative and informal relationships among community members that form the base of the design culture within the community were analyzed using the network maps from three lenses of proximity - generational, disciplinary and physical proximity between community members. These three lenses of proximity derive from the interviews, where the participants underlined the importance of time, interests and contact repeatedly when talking about the drive behind their interactions regarding both creative and informal relationships.

3. Social Networks as Enablers of Design Cultures

Design cultures benefit from rich interactions that trigger creativity and enable knowledge sharing. We examine the characteristics and dynamics of creative and informal networks within the Co-creation Hub community to examine how these types of networks are shaped and interact in creative communities.

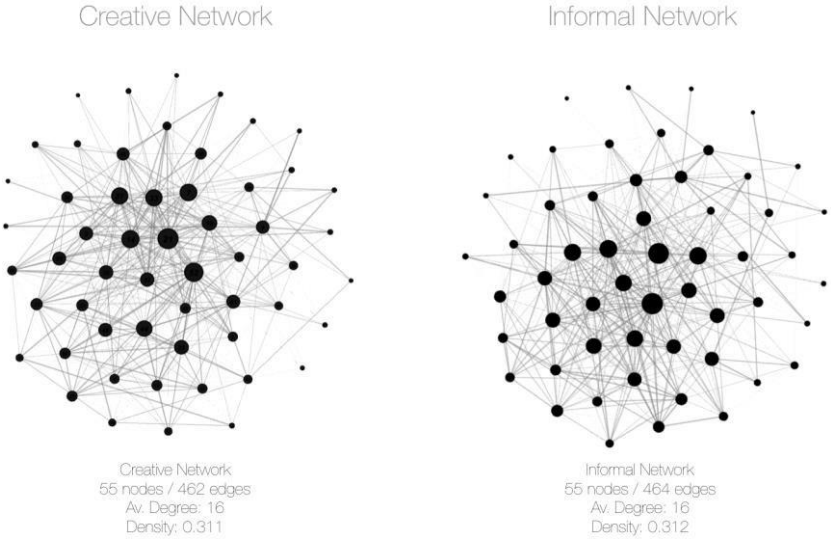

Figure 1. Creative and informal networks

First, it is important to describe dimensions of each network in order to set the context. The community consists of 55 regulars (who are represented as circular nodes in the graphs), who regularly visit the premises. All of them are actively engaged in the network, as there are no disconnected nodes in either of the networks. The average degree in both networks is 16, which means that the nodes are connected to 16 other nodes on average (29%). The highest degree is 42 in both networks, and the lowest is 1 in informal network, and 2 in creative network. In Figure 1 and in all the other images presented in the paper, the node sizes are defined by their degree (how many edges, or lines, are connected to them). Between the 55 nodes, there are 462 edges defined in the creative network, and 464 in the informal network, which makes the network densities comparable. Density refers to the ratio of the established connections to all possible connections in a network. In both networks this value remains around 0.310, which points out plenty of opportunities for collaboration and unrealized potential within the networks.

3.1 Generational proximity

Generations in this design community will be the first aspect to be looked at as a proximity parameter. Creative communities consist of members that have different levels of experience, and the hub is no exception to this. The actors in this network can be divided into three generational categories. Group 1 consists of people up to the age of 25, who are either researchers or working at the hub part-time during their studies (18.18%). The second and the largest group is those between 26-40 years old, representing more than half of all the nodes (54.55%). This group is highly diverse in terms of background and position. The third group are 40+ year old experienced staff, who are mainly involved in teaching (27.27%).

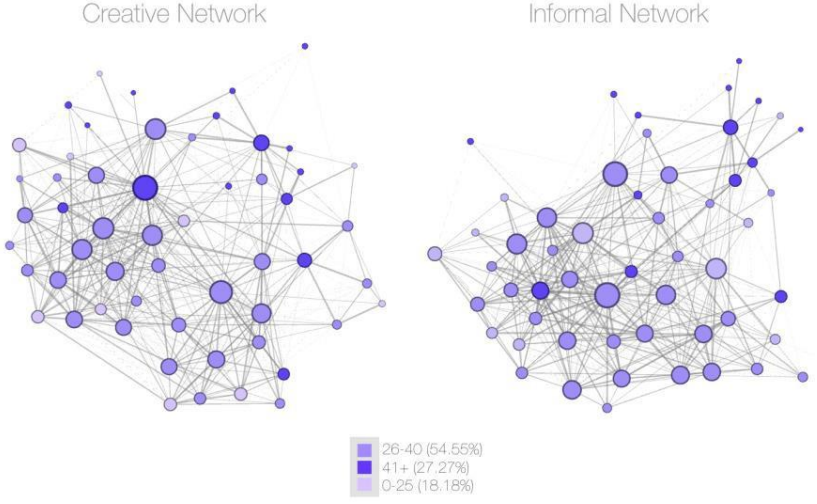

Figure 2. Age distribution in the creative and informal networks

The two maps in Figure 2 show the distribution of age groups and how they are linked to each other. The node sizes identify the degree of the nodes, whereas the color identifies the age-group. It is possible to see that (especially in the informal network) there is a generational gap between the members of the community. Nodes of similar age occupy the central area, while older and younger generations remain on the periphery. When talking about the older generations, who in this case have more experience, a peripheral role is not necessarily a negative aspect. This peripheral role enables an experimentation culture, where trials and errors are permitted, without the presence of highly central nodes who are powerful and highly experienced. When it comes to younger generations, the situation is different. Younger generations do not occupy a central role in the maps and they remain in the periphery in both networks, which can limit being an active part of the community. The richness of intergenerational knowledge exchange can be meaningful for design cultures, as generational values and awareness inform design decisions (Gamliel & Gabay, 2014). Actors that hold a central role should purposefully engage younger generations into creative and informal circles. One interviewee mentioned: “I believe in apprenticeships. I see X as a younger version of me in a way, I try to pass on every bit of my knowledge.”
Another aspect in relation to time is the years of involvement in the hub. Figure 3 shows the distribution of experience through the colors of nodes. The hub has a strong core group of people who have been a part of the community since their studies. The maps show that the majority of the nodes have been involved in the hub for longer than eight years, with some being highly central in the networks. Especially in the creative network, the lighter nodes remain on the periphery. One interviewee explained: “I have been here for a very long time. You could say that I grew up here. Of course, relationships change, but it is very hard to forget long lasting bonds, I feel somehow responsible towards them, as if we are on a mission together.”

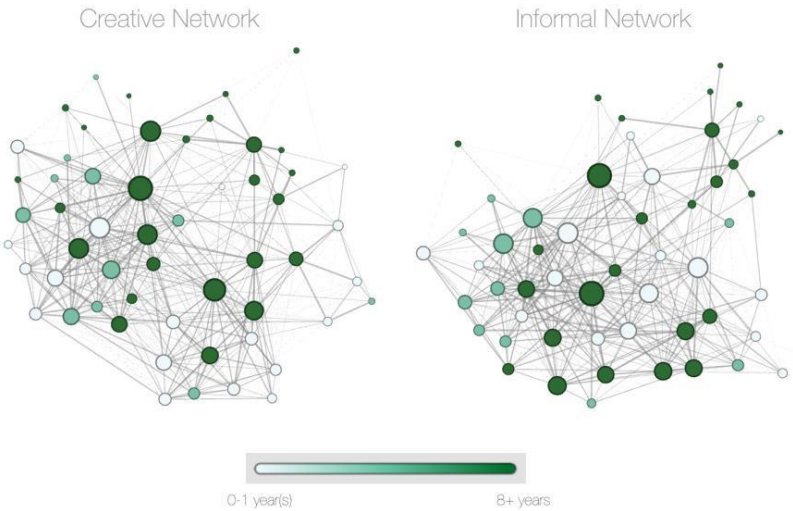

Figure 3. Years of involvement within the creative and informal networks

3.2 Disciplinary proximity

The hub defines itself as an interdisciplinary co-creation hub. Between the 55 regular members of the community, it is currently possible to identify four disciplinary backgrounds, which are engineering, business and management, arts and design. In the hub's context, engineering (industrial design, mechanical, electronical) is the dominant group with more than half of the community being engineers. Looking at Figure 4, the majority of the central nodes of both networks consist of a multidisciplinary group, although in the informal network similar disciplines are clustered more together. In both networks designers, artists, and those from business and management backgrounds occupy the center of the graphs with high degree nodes. Additionally, in both networks, it is possible to see that the engineers (red nodes) tend to stick together on the periphery. However, engineering knowledge plays a crucial role in technological innovations since it enables execution of tangible outcomes.

The artists on the other hand, are the best embedded group within the community. They enable diversity in the creative network by collaborating with multiple disciplinary groups. Additionally, artists are central to the friendship network, which points out high level of trust and sharing on a personal level. One interviewee stated:

“Everybody knows something else here. That is what I like about this place. And people are full of surprises. Together we make more than the sum of our capabilities. I am sure if I come up with, I don’t know, a crazy new idea, I am sure I can find enthusiastic people to join me right away. We can rely on the community.”

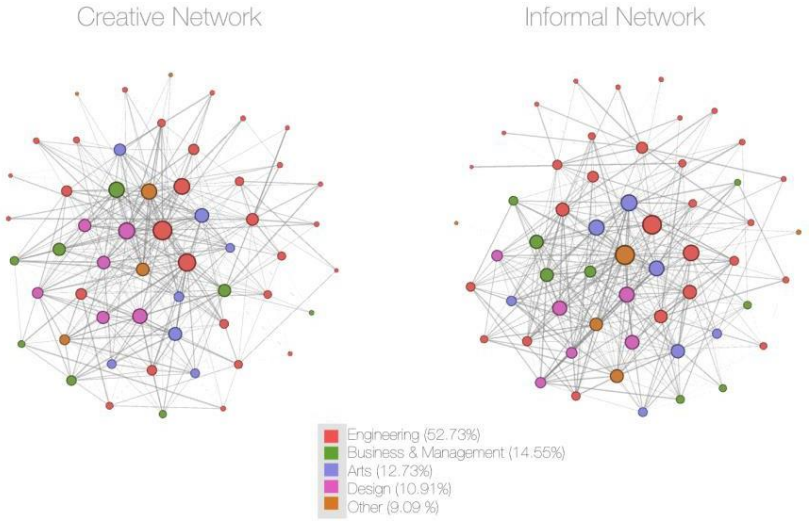

Figure 4. Disciplines within the creative and informal networks

Figure 4 also shows us the lack of collaboration between certain disciplinary groups in both networks. For instance, designers do not collaborate with engineers in the creative network except for a few central nodes in the middle. A common pattern is also visible in the informal network, as designers do not communicate directly with the large group of engineers that are on the periphery. Therefore, it is possible to say that the design culture of the hub would benefit a lot from channeling the unrealised potential. Artists of the community can function as the gatekeepers between these disconnected groups if their potential is operationalized.

3.3 Physical proximity

A final type of proximity at play in the hub is the physical proximity, or in other words the spatial layout that enables certain groups to be in contact. Although the building is especially developed in a way that brings disconnected actors together under informal circumstances, such as having open spaces for eating, meeting or relaxing, during the majority of the day the employees sit at a certain workspace. It could be argued that those who work in close proximity are more likely to engage into creative relationships, while remote work with regular meetings could also be enough to facilitate the necessary team dynamics.

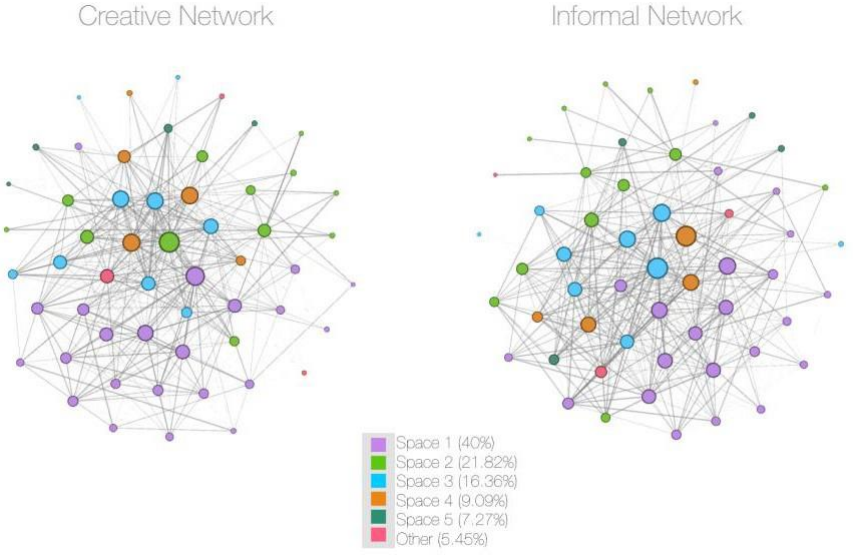

Figure 5. Spatial distribution of the creative and informal networks

Figure 5 shows the distribution of nodes to workspaces. Each color represents spaces that employees use as workspace. The common spaces for eating, meeting and mingling are not taken into consideration. In this case, considering that the offices are designated to certain teams that work together on projects, it makes sense that people who share the same

spaces are clustered together in the creative network. However, the threshold is kept very low and there is plenty of flexibility in terms of work spaces. One interviewee remarked:

“Although our tasks are very different, we are good friends with X, and sometimes I just grab my laptop and go sit in their office for half a day. It helps me to gain new perspectives.”

What is interesting is that we see an even stronger clustering pattern on the informal network that suggests stronger friendships between the people who share the same workspace. Indeed, the situation in the hub points out the importance of daily encounters for getting acquaintance that also enables idea sharing and collaboration. This dynamic has potential to lead towards a mini-silo effect, where people are hesitant to step into each other’s designated work areas (Bevc et al., 2015). In fact, one of the interviewees stated:

“Group X sits somewhere else in the building behind closed doors, I feel uncomfortable barging in and asking what they are working on.”

The community in the hub is investing a lot of effort into disabling silo structures, but adopting rituals that bring the entire community together on a regular basis and keep them up to date on what is going on within other projects. Weekly community breakfast hosted by different project groups, bi-weekly staff meetings, regular research presentations, as well as the active use of common spaces are examples to such routines (Bjorklund et al., 2017).

4. Discussion and implications

Studies on social networks that investigate the dynamics of creative and informal relationships are often based on case-studies on organizational level (Borgatti, & Foster. 2003). A majority of these results point out the parallel development of creative and informal networks, as people commonly prefer to commit to creative collaborations with people that they have positive feelings for. In fact, already in 1973 Granovetter argued that close friendships are the best for innovation, since they provide ideal grounds for communication that consist of trust, values and matching objectives. However, the literature also suggests that close friendships can be a threat to creative relationships (Kratzer et al., 2006). The reason behind this is two folds. First of all, creative collaborations that have an impact require the community to be open to external information to be able to think outside of the box. In close-knit communities, it can be difficult to penetrate the friendship bubble, where foundations of creative collaborations are built on. It is important to enable the constant flow of new knowledge and skills into the community and facilitate the growth of creative potential. Secondly, strong friendships within creative communities can potentially hinder critical thinking, which is an important element for design cultures.
Obtaining a critical mindset and being able to give constructive feedback on each other’s progress is a crucial element of progress (Kratzer et al., 2006). Therefore, design cultures must steadily question their openness towards external knowledge. Creating a community with diversity in age, experience and discipline can be a starting point.

In this paper, the underlying dynamics of creative and informal networks among the staff of a close-knit creative hub was explored, in order to see how these two different networks deriving from two different natures of relationships operate within the same group of individuals and lead to a rich culture that facilitates design, innovation and entrepreneurship. In the case of the creative networks of the Co-creation Hub, the majority of collaborations are initiated by more experienced actors, and they operate as a bridge between different groups of less experienced actors. This highly important role of gatekeeping is risky in terms of network resilience, as any change in the position of such individuals could have catastrophic results for the network and damage the flow of information between the rest of the actors (Celik, 2018). The co-creative design culture in this community relies heavily on agile ways of working, where responsibilities are easily shared and member's trust in each other's skills is very high. Therefore, it is important that the gatekeeping role should be mitigated by delegating connections to less experienced members, in order to create and maintain a healthy centrality balance in the network.

On the other hand, hubs often aim to create connections across diverse groups. In the current study, some clustering could be seen amongst the majority, whether in terms of age, tenure, discipline or primary working space. However, connections across all groups were frequent, and minority tenures and disciplines in particular had rich connections in both the creative and informal networks. Interactions amongst diverse groups can help to create novel perspectives through combination, with for example, generational norms and values having a high influence on the way we interpret the world around us (Del Conte & Celik, 2015). Design cultures that facilitate such diversity will benefit from the richness of different perspectives that arise from the knowledge exchange between different groups.

By providing a close look into the network structure of the Co-creation Hub, this study bring together two fields that are rarely studied in combination, social networks and design cultures, but also contributes to the field of design research from a methodological perspective by providing a mixed method approach where qualitative data gathered through interviews is used to interpret the quantitative data gathered through the social network analysis and provide multilayered results that shed light on both actor-level and system-level dynamics.

To conclude, we have observed that creative and informal relationships evolve in an interdependent manner in design cultures. Generational proximity is more important in informal networks, possibly because being in the similar phase of life brings more commonalities. We saw that in the creative network, older actors remain in the periphery and leave the stage to younger members only to intervene if necessary. However, we found tenure to be a better informant of generational proximity than age, as tenure refers to the openness of the design culture for new and less experienced members. Disciplinary proximity has shown slightly more relevance in forming informal relationships than creative relationship. There could be two speculations on this dynamic: either the need for

multidisciplinary collaboration in the creative collaborations exceeds the informal interests of members; or informal relationship have a longer history that date back to study times and hence they are stronger than relatively newer creative relationships. The study confirms that physical proximity does play a role in the development of both creative and informal relationships. Additionally, the study highlights rituals and mindsets that are adopted by the community members to enhance creative collaborations through abundant informal connections. Multiplex bonds between actors seem to eliminate the risks towards network operations by creating a safety net and therefore encouraging experimentation, which could be an inspiration to other design cultures that have similar goals.

Subversive Design. Designer Agency Through Acts of Insurgence

Seth Parker
seth.m.parker@gmail.com

Emily Carr University of Art + Design

Abstract | Designers working within Small-Medium businesses are habitually positioned to be cogs in the capitalist machine, working only to produce a visual output. This paper explores giving designer agency within these types of organization through the notion of *Subversive Design*; investigating how designers can influence the trajectory of businesses through the act of subversion. By examining instances of subversive acts within a consumer hard goods business, and the methods and results of those act; breaking down how incremental design decisions transpired as a way of subversion. Through the creation of agency of designers to establish and drive design-led projects, we are able to investigate the direct impact of designers work within an organization. This subversive method embedded within design process permits designers to employ methodologies such as Transition Design, System Change, and Design for Resilience into their professional practice.

KEYWORDS | SUBVERSIVE DESIGN, BUSINESS OF DESIGN, DESIGNER AGENCY, DESIGN FOR CHANGE

1. Introduction

In-house designers, in particular, those working for small to medium-sized businesses in North America, are often categorized exclusively as production designers. These roles are created by CEOs or Directors who may not have a background or cognizance in design practice, and as such, perceive the positions from a conventional viewpoint where the role of *design and the designer is understood as that of visual output*. As a result of this, designers are often not given the opportunity, space, or agency to advance and disrupt businesses via much needed creative solutions, interventions or products. Through a descriptive analysis of design-driven projects situated within a small-medium enterprise (SME), this paper reveals how incremental design decisions transpired and acted as key sites of subversion. These subversive acts impacted not only the business but also the role of the designers within this SME — referred to as *MARIC* to maintain anonymity for the organization. These acts are considered as methods that designers may use opportunistically to push forward toward positive and needed system change. With the controlled scope of focusing on MARIC as a case study, the research acts as a preliminary definition and contextual groundwork for *Subversive Design*.

Focusing on means of affording agency to lower-level employees within SMEs, this paper explores the formation of *Subversive Design* — investigating how designers can influence the trajectory of a project through deliberate and enterprising acts of subversion. This exploration of subversion within design builds off the work being done within the approaches of Transition Design, Persuasive Design, and Critical Design which will be discussed throughout. *Subversive Design* exists in parallel to these methods, while concurrently working within the method's established contexts to aid in the production of applied research.

The evolution of contemporary business models and operations has accommodated the adoption of design methodologies into executive suites across the globe. This shift has provided a spotlight on design education's approach to design thinking and its role in business (Cassim, 2013). The transformation, while predominantly to the advantage of the expansion of the design community through job creation and industry exposure, has been rudimentary - its impact focusing more on start-up businesses and institutions with extensive capital resources. The integration of design into the conventional process of business decision making is often limited to large, well-funded organizations and presented to executive and director level employees to embrace the design as a valid business methodology (Muratovski, 2015). This paper focuses on the context of small to medium enterprises (SMEs) that represented more than 50% of Canada's gross domestic product (GDP) (Government of Canada, 2019) and 44% of the GDP in the United States (Government of the United States, 2019). Design Capitalism, which links economics and design in the grounding of future creative economies (Murphy, 2015) acts as a foreground for this research. It is building from this framework, and by applying the methodology of *transition design,* we begin to investigate whether "design-led societal transition" (Irwin, 2015), can be

used to reconceptualize lifestyles and systems to encourage economic growth through socio-political change utilizing concealed acts of positive insurgence.

A case study grounded on MARIC serves to illustrate and consider opportunities that arise when a small team of designers and non-designers are tasked to build on a company's existing product portfolio. The preliminary research presented centres around the daily operations of this business, it's social and cultural restrictions. By giving agency to designers at all levels within MARIC and affording them means to create and drive design-led projects, we investigate the direct impact of designers work within an organization. This triggering of designer agency was approached as Research through Design (RtD) as articulated by Cristiano Storni, "In RtD, design is not what you look at but rather what you need to extend the ability to investigate and acquire new knowledge" (2015, p.74) Though the integration of RtD into contemporary business practices, aiming to establish a foundation of creative agency within the organization.

2. Subversion as a Construct

2.1 Archetypes of Subversion

In order to recontextualize subversion and apply it to design practice, we must look at the traditional definition of subversion. Subversion can be defined as "the overturning or abolition of an established or existing practice, belief, rule, etc., or of a set of these; the transformation of a state of things; an instance of this." ("Subversion, n.," n.d.). From this definition, subversion can be understood as the intentional overthrowing of large established systems. In actuality, subversion also exists in the small moments of life; a public transit commuter jumping the faregate of a subway or a cashier placing only a portion of produce on the scale to lower the price for an underprivileged family. When observing the instances subversion exists in the everyday, we begin to decipher that subversion is often a nuanced act. Subversion provides a way of navigating the world that permits a subtle insurgence against power. Understood as a method in which individuals navigate any given system or situation, the dimensions of subversion and how it operates become more apparent. As a means of deconstructing the term for applied usage within design, I have identified three subversive archetypes tied to subversive acts. These three types subversion are an initial classification, additional forms or variances to these may be identified with further research.

1. **Overt Subversion**

   Overt Subversion is a type of subversion that is most easily identified by the general public. These acts of subversion are instances in which an individual or group consciously and evidently subverts an established practice or system. This could occur in small instances such as a citizen blatantly ignoring a city parking by-

law, dumping garbage in a “no dumping” zone, or protesting governmental legislation. In the contemporary context we see this played out as strained political relationships in the United States triggering significant acts of overt subversions, be it through Donald Trump’s brash disregard for historical political standards (Zurcher, 2020); or Nancy Pelosi’s statement-making tearing of the President’s State of the Union (Kellman & Mascaro, 2020).

2. **Inadvertent Subversion**

   An act of Inadvertent Subversion is one that is not easily identifiable without in-depth analysis. These are instances where the subverter is unaware of the subversion and its associated consequences; this could occur when an individual operates within their daily lives without realizing the implications of the smallest actions. For example, before rampant news coverage over the political views of its CEO, A patron to the fast-food restaurant Chick-Fil-A may be unaware of the political ties the ownership has to anti-LGBTQ groups, and by visiting these restaurants, the individual inadvertently supports the marginalization of a group of people. (Weber, 2013)

3. **Covert Subversion**

   Covert subversions are ones that deliberately contravene established rules or systems in an attempt to overturn or advert the existing structures. This particular method of subversion is one that designers often actively invoke/use as a means to prompt and move their work forward. Not to be confused Persuasive Design that encourages behaviour/user change through the utilization of a design (Fogg, 2009), Covert Subversion occurs within the *process* of design and not through the use of the designed object. The implications of the design existing within the world may have repercussions that progress the original subversive ideals – but it is not markedly the interaction between the design and the individual that generates the change – *it is creation and existence of the design that cultivates change*.

2.2 Power Relations

Irrespective of archetype or context, subversion exists within structures of power and the attempted insurgency of that power. There is nothing to be subverted without the presence of an element of power — this can social, economic, political, religious, or structural power. Within these power relations, we can demarcate between two contrasting groups that I will refer to as *Ascendant Power* and *Subservient Force*. Each relationship includes the Subverter — the agent that is doing the subverting, and the Subvertee – agent that is a being subverted. The Ascendant power is the group or system that holds the dominant power; this can be represented as governments, economic structures, or social norms. The Subservient Force is more exclusively a group of people, often marginalized, that is impacted by the

Ascendant Power. Referring back to the Oxford English Dictionary's definition of subversion, it is the Subservient Force is that which subverts the Ascendant Power; this is can be characterized as an overturn of power of political leaders. Within this dichotomy of power, the system, group, or individual that exists within/as the Subservient Power is relegated in some form — their power has been taken away or agency over their power was never afforded. This practice of the subservient subverting the dominant is the most common understanding of subversion due to the conventional definition (fig 1).

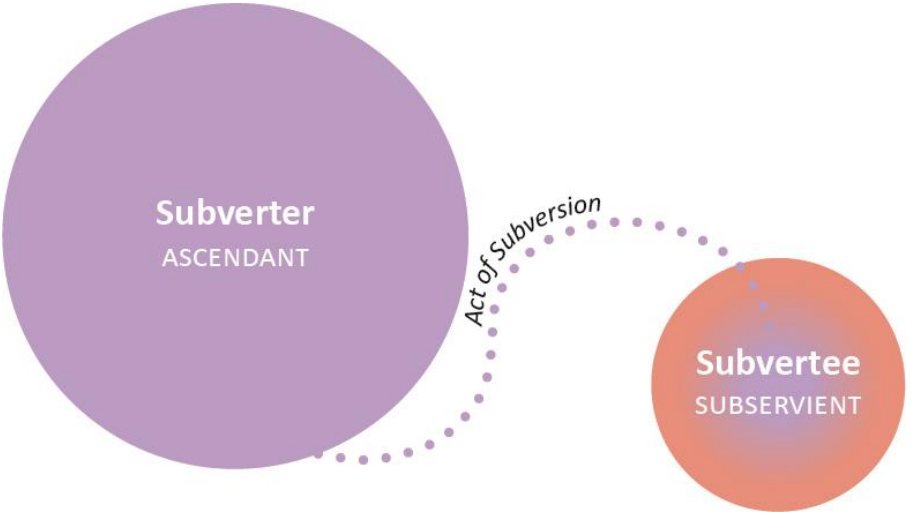

Figure 1. Flow of Subversion; Subservient Power infiltrating Ascendant Power

When reviewing the ways Acts of Subversion occur, there is a consideration that the process is bilateral. In some instances, the Ascendant Power acts as the subverter (fig 2). These occurrences are quotidian; represented and concealed through, namely, governmental policies and structures. A prime example of Ascendant Power acting as the subverter is the nature in which the Chinese government polices its citizens use of the internet, subverting the public's free speech and access to information through digital censorship (Zittrain & Edelman, 2003). Many occurrences of subversion by Ascendant Power are not perceived as subversions as a result of common acknowledgment of power structures (governments), as a means to rule

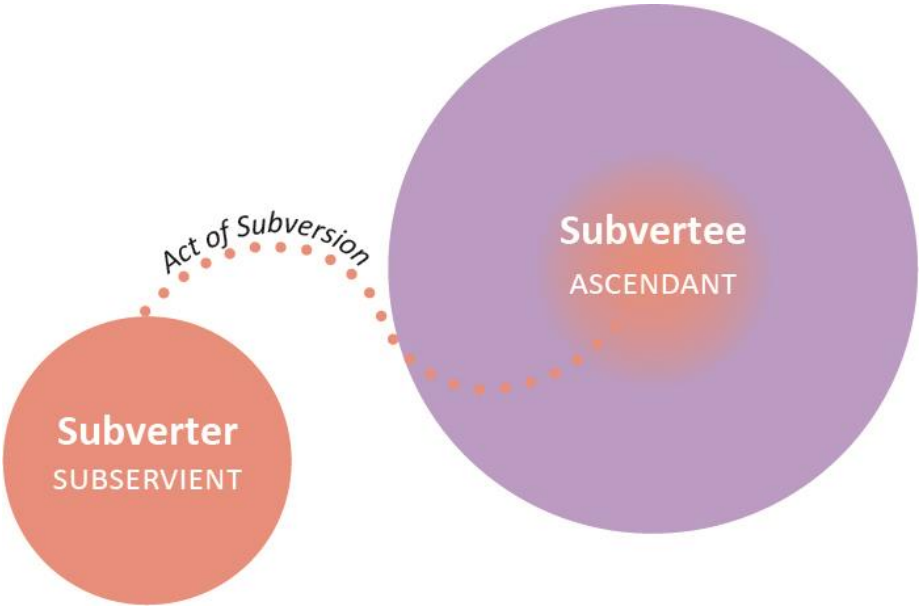

Figure 2. Flow of Subversion; Ascendant Power infiltrating Subservient Power

These two power relations are important considerations when implementing subversion into design practice. It is important to note that these power relations are not simple connections and do not always operate as dichotomies and have been expressed above as a preliminary effort of defining power structures within subversion. Understanding how individuals/groups subvert existing structures informs processes that the designer can utilize when defining the scope of their project. The knowledge of how existing structures subvert, or are subverted, can assist to elevate designer's comprehension of the scope of their work, identifying opportunities for subversive integrations.

3. Acts of Subversion: A Case Study

The below Case Study takes place from 2017-2020 during my tenure at MARIC. All projects were led by me in collaboration with creatives both in house and externally.

3.1 State of the Business

MARIC is rooted in decades of operations as an importer and distributor company – sourcing consumer products from overseas and bringing them to market in North America. The

company's primary focus for the mass amount of its history has been through independent retailers and large box stores. Recently, in the last decade, the company stumbled into the online marketplace and became a first adopter on one of the world's top eCommerce marketplaces. Through the happenstance success of eCommerce sales, the company witnessed rapid fiscal growth. This growth, however, did not translate to a reimagining of its product offering through design, development, or marketing. In the history of the company, there has been no initiative to position itself as a design-driven organization, despite consumer products being the sole revenue driver for the organization.

An extensive cultural and operational shift has occurred within the organization since the end of 2016, with the ownership acknowledging the shifting retail and e-commerce landscape. New executives were brought in to bolster this change, which occurred in a turbulent manner. During 2017-2018 the company witnessed a turnover of 80% of its office workers. The focus of the organization became about streamlining operations and leveraging warehousing and sourcing capabilities, as this is what brought the company success in the past. As a result, MARIC saw continued staff turnover, a reduced customer base, and a downward sales trajectory. Through the years of discomfort the product and design teams urged the executive leadership to invest in its design and product teams in order to deliver economic growth for the business, understanding that product design can increase not only the company sales but can translate as a reduction in costs as well (Guo, 2010). Unfortunately, the pleas were not often met optimistically, and as a result, the design leadership turned to considerate and heedful covert acts of subversion in an attempt to progress the company forward while maintaining their values as a designer. While not always the case, there are instances where MARIC does invest in elements of design and product. Three examples of *Acts of Subversion* represented as Design-led initiatives that occurred at MARIC within the last two years will be discussed below. Established to support and embolden designer agency through *Subversive Design*, these initiatives investigate how subversive acts within contemporary business practices and nomenclature might influence the objectives and outcomes of interconnected industries while simultaneously informing the creation of resilient systems (Manzini, 2013). These acts are incremental activates that either partially or wholly embody passive insurgency through their process of creation.

3.2 Act of Subversion I: Applied Design Project (APD)

The primary activity in this case study of MARIC was the development and execution of an applied design project that brought together a local Design Academy and MARIC. This was presented to MARIC administrators as an opportunity for the company to explore new ways of acquiring new products. Traditionally, as a trading company, MARIC only sourced products overseas – offering no design 'value' to the local marketplace. This APD was a low-risk venture in which the organization could explore the processes and outputs of designing a product 'from scratch.' Low risk in this scenario is defined as (1) not requiring a considerable investment for new employee hires or product sampling, (2) not distracting the existing product and design team from their everyday objectives. Upon the sign off of the

collaboration, the APD formed as a five-month program established to design a new range of products that MARIC could manufacture overseas and sell to the Canadian market.

Participants:

- 2 Industrial Design Undergraduate Students (2nd + 3rd Year)
- 1 Communication Design Undergraduate Student (3rd Year)
- 1 Graduate Researcher (Design Manager at MARIC)

Each participant in the collaboration had a specific objective that they hoped to get out of the project. The list outlines the objectives of each participant and ranks them as a *subversive stratum* (fig 3).

> *Researcher Objective*: (1) Explore how design can influence business operations and objectives. (2) Examine the potential for producing the designed product in Canada.
>
> *Company Objective*: Acquire a new range of 'designed in Canada' products to sell and market.
>
> *Student Objective*: Design a new range of shelving, or shelving adjacent products suited for small space living

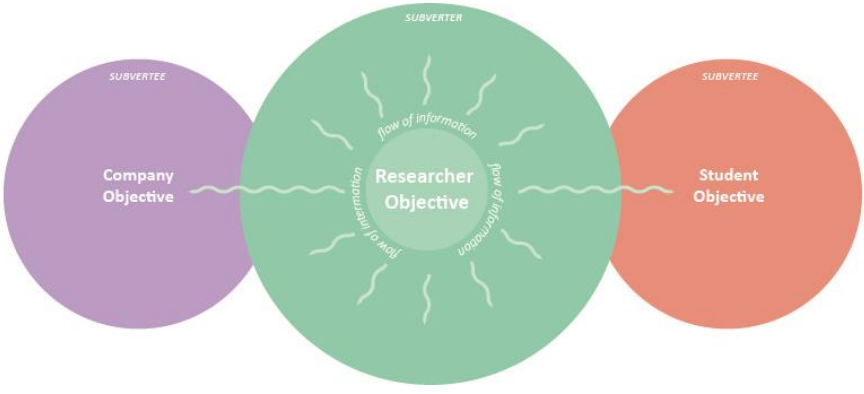

Figure 3. Subversive Stratum. Driving goals through design briefs.

Throughout the process of the project, members of the MARIC team attended critiques at the academy in tandem with Design faculty and independent industry designers. Established by the graduate researcher these critiques were situated to (1) provide direct feedback from industry and academy to the undergraduate students on the development of their design concepts, while (2) subversively assimilating an element of the design process into the genesis of MARIC's company culture. In the end, a product concept was presented that won admiration from MARIC's design team, sales team, CEO, and board of directors. The praise was so high that it was determined, for the first time in the company's history, that an

exploration of local manufacturing was to be explored. While the viability of manufacturing the product in Canada dithered, it's impact on the company's thought process surrounding the notion of localized production was shifted permanently. Swiftly, the product developers, sales managers, and even the CEO were including goals of local production in their everyday work conversations.

3.3 Act of Subversion II: New Product Development

In mid-2019, a meeting took place between design leadership and the CEO. The team discussed the company's forward trajectory and how they might capitalize on the business in the future. The design leadership recommended the company put a significant emphasis on the design and development of new products, instead of the sourcing and modification of factory products that they believed was the wiser and more secure route in the interim. At the close of the meeting, the leaders agreed to work on the modifications of an existing product line (new colourway and finishing). With the knowledge of the lengthy design and development timeline, the design leadership withheld a significant piece of information - they would also be tasking the small design team with an assignment to design bespoke products as a side project.

Back on the Design floor, the company's three designers were presented with the subversive act of designing a new line of products for the company. They were not informed of the previous conversation with the CEO but were advised to work on the project only when free time was available for them to allow them to work on it. In the three months that followed, it became apparent that everyday projects that occupied most of their time could be completed in a faster manner, maintaining a high quality of work while providing the space for the designers to pursue the new bespoke design project. At the end of the three months, in addition to the colourway and finishing work, the design team provided the company with a new catalogue of custom designs that would be presented to new and existing customers.

3.4 Act of Subversion II: New Business Partnerships + Local Production

A by-product of the work done during Act of Subversion I, a comprehensive analysis of local production facilities occurred, to determine the feasibility of local production for the select range of product. As a result, a new relationship with an injection moulding facility was formed. This manufacturer produces utilitarian products such as flooring and packaging tubes for a cosmetics company but also operates with a value of sustainability; turning waste stream materials into new products and reducing transportation and carbon emissions. The discovery of this facility and subsequent introductory relationship led to many fruitful conversations within MARIC, ultimately resulting in the development of a nascent design project - a new range of eco-plastic products, produced using waste from local curb side recycling. To date, this new venture has not been discussed with anyone outside of MARIC's product team. If successful, this partnership would define a new groundwork for MARIC to begin production in Canada.

3.5 Results

The projects and acts outlined throughout this paper are projects based on reflexive intuition by the design leader, trusting that in their experience as designers, managers, and researchers will attribute to a positive impact for MARIC. The tangible implications of these Design Subversions are only beginning to come to light; however, it is possible that these interventions act as instigators, or directly influenced the trajectory of the company. In the months following each of these acts of subversion the company has seen a dramatic shift in its outlook and business objectives including but not limited to:

- A large investment to attend an international design trade show and research trip to Europe
- Expansion of the product and design team twofold
- Awarding of “category captain” by a key retailer, affording full control of the retailer’s product section
- Securing a face-to-face design meeting with one of the largest global retail chains, redefining a once failing business relationship with immediate sales increases.
- Launching a new company mission which includes a call out to “engage with Canadian designers + artists through the continued development of originally designed product”
- Establishing short term and long-term company goals:

    1. Develop professional opportunities for Canadian artists and designers, supporting local communities and institutions.
    2. Produce products in socially and environmentally responsible ways and stimulate regional economic growth where possible by meeting the following targets:
    3. 90% recyclable packaging materials
    4. 50% of products made of sustainable materials
    5. 100% of suppliers to meet socially and environmentally responsible standards by 2024
    6. Investigate domestic production and assess the feasibility of a pilot program

4. Subversion as Design Practice

Design historically and primarily operates in systems of capitalism (Margolin, 1989), with designers working in house, as contractors, at an agency, working for for-profit organizations. The clients in these situations indicate their objectives, and it is the designer’s role to manifest an idea to suit the objectives. The design interventions illustrated above are subversive. Subversive design operates within these capitalist design systems and encourages the designer to continue to meet the project brief while lacing in acts for positive change. The designer must operate on high ethical grounds — this is a critical

component to the notion of subversive design, taking influence from transition design and its principles as described by Terry Irwin:

> "Transition Designers learn to see and solve for wicked problems and view a single design or solution as a single step in a longer transition toward a future-based vision. Transition solutions might have intentionally short lifespans where obsolescence is a given because it is a step toward a longer-term goal." (2015)

Subversive Design employs the future-base vision of Transition Design and applies its motives for solving these wicked-problems by introducing subversive elements into the design process. *Subversive Design's* anarchist-like approach encompasses working in components of systemic issues into a design brief without the avert awareness of the client. The intent is not to change the project by producing an outcome that is in direct opposition to the client's needs but to infiltrate elements of the design process/product that will act as small levers in a more extensive system. This method allows for design to continue to operate within the capitalist models while moving forward towards a more resilient economy. Within daily constraints of business operations, we are given permission - by ourselves - to act as design researchers in the field. As soon as a designer begin to insert particulars into their brief that are not widely known, they have given themselves permission to discover – finds ways to shift and open up new opportunities and – arguably – give a site for new knowledge to be revealed and shared.

> "New knowledge gained in the frame of redirective practice can also bring greater authority to the application of one's practice, this not least because of the support gained from other voices speaking similar messages, and other practitioners delivering projects informed by the same imperatives." (Fry, 2008, p55)

The pursuit and development of new knowledge through *Subversive Design* can encourage the integration of design methodologies utilized in formal design education; encouraging the undertaking of wicked problems (Horst & Webber, 1973) within the industry. Methods of subversion permit the designer to bring their experience and knowledge from the lab *(academy)* into the field *(industry),* an occurrence that could bring much discomfort for new designers. As presented in the foreword to *Design Research Through Practice,* Ideo's managing director Jane Fulton Suri describes the importance of confronting global problems in industry:

> "Design research plays an important role in illuminating and tackling many complex problems facing the world today. It encourages and enables social change and challenges assumptions and beliefs about how we live, work, and consume. It raises questions that prompt us to consider other possibilities." (Koskinen, 2011).

By assimilating Design Research into industry and businesses that are not privy to this type of knowledge creation, the scale of real-world impact for designers grows exponentially. In a report analysing the creative economy identified that 30% of respondents worked for an employer that did not have design as a core service (Association of Registered Graphic Designers, 2017). Organizations without design as a core service are the most susceptible to

the subversive integration of Design Research into their practices – constructing a condition for designers to augment the scale of their impact of their own fruition. This integration of Design Research within the applied context of working in industry allows for designers to work within critical spaces; consenting for the exploration speculative and prevocational (Dunne, 2006) work while maintaining integrity of a desire design outcome.

5. Conclusion

The research presented through the subversive acts at MARIC are rooted in business, and the results are reflected primarily through sales statistics or leads. These examples however illustrate a preliminary byproduct of designers taking agency over the context of work through means of betterment. This case study review only touches the surface on what subversion can accomplish when recontectualized and applied to design within SMEs; the abundant potential to transform subversion as a method within the design process is encouraging. Designers have the potential to impact their work by their own means, despite being constricted to the operations of a capitalist society; this impact can translate as influence beyond the scope of only their project.

In a world that suffers from ongoing natural disasters, novel viruses, social inequalities, and catastrophic environmental concerns – designers are posed to be in a position enact change. There is no singular solution or approach that will grapple with all of the problems in the world; however, a myriad of incremental and subversive movements that can be made through varying processes and disciplines in an attempt to progress forward. Designers often feel as though the work they do either directly contributes to these issues and that they have no agency to change any of the situations they find themselves or their work situated in. *Subversive Design* is an opportunity for designers to take agency of their work and ensure it is moving in a direction that fuels future generations.

Abstract | Three quarters of the European population is concentrated in cities, with urbanization continuing to grow at high speed. In contemporary cities, living is more and more based on "mobile lives". Young people live a significant evolutionary dynamic phase characterized by increasing both experiences opportunities and uncertainties. Starting from the design of interiors, a reflection on the development of the urban context is needed to understand, encompass and balance the ongoing social transformations and the lifestyle evolution. The overlapping, contamination and fertilization between different architectural typologies and functional solutions as well as new using ways allows the development of a new system called hybrid spaces. The paper investigates the emerging topic of care, highlights its potential relevance for the future generations and outlines the contribution that design, with a specific focus on the interior design approach, can offer to post-industrial society[1].

KEYWORDS | URBAN WELLBEING, INTERIOR DESIGN, HYBRID SPACES, RESILIENT CITY

[1] The paper is the result of a project titled *City of Care. Wellbeing for a new human dimension in future Urban Environments*, which is ongoing under the responsibility of the Authors.

1. Introduction

Cities concentrate three quarters of the European population, with urbanization continuing to grow at high speed. A United Nations report predicts that in 2050 more than 70% of the world's population will live in urbanized contexts[2]. This will be accompanied by the highest level of migration due to climatic causes[3] and to the perverse effects of globalisation and profit-driven economic policies based on inequality at the expense of cultural identities and people's needs.

Health and wellbeing are critically influenced by the natural and built environment as well as by social relationships. In urban contexts, environmental changes, like air and water pollution together with transportation problems, are decreasing social cohesion and rising stress, also affecting physical and mental health. Studies on the long-term effects of growth in an urban environment show an increase in psychological disorders such as anxiety, panic, boredom, sleep disturbances. If health is assumed not merely as the absence of disease or infirmity but as a state of complete physical, mental and social happiness[4], we understand how the individuals and communities' life quality plays a key role in promoting and maintaining health status[5].

As European cities are growing, they are progressively acting and introducing policies to become more sustainable and liveable, adapting to climate change, investing in a range of smart and innovative solutions, higher energy efficiency and stronger social cohesion and inclusion. In Canada, USA as well as in Asia and Africa similar initiatives are ongoing[6]. Starting from the design of interiors, that plays a fundamental role in the creation of spaces where people live, work, relate with others, all these issues call for a reflection on the development of the urban context able to understand, encompass and balance the ongoing social transformations and the evolution of the lifestyle. In a wide perspective, beyond the concept of smart cities, an idea could be supported promoting the notion of a resilient city, more accessible and inclusive for all people[7].

2. The city scenarios

In contemporary society, the ongoing digital revolution, the evolution of human relationships and the ease of mobility, coupled with a general decrease in travel costs, have deeply changed social practices associated with the persistence of individuals in the same place for long periods. Living is more and more based on momentary conditions related to new lifestyles dictated by working and personal activities, that often determine “mobile lives” (Elliott & Urry, 2010). We are living a “disruptive mutation” (Baricco, 2018), that is a total subversion of the use patterns of spaces and services capable of altering all the "solid" and archetypal conceptions that we had established. For these reasons, the diffusion of co-living and co-working experiences have increasingly exploited new sustainable practices combined with a progressive blurring of the boundary between the worksphere, the space for hospitality and living, a nomadic style finding its stage in the city. These social modifications impose a reflection on the new development of the urban context able to support the ongoing lifestyle evolution. As demonstrated by a research carried out in the Design Department at Politecnico di Milano, these social developments impose a definition of a new hybrid system of space-services characterized by the overlapping, contamination and fertilization between different architectural typologies and functional solutions as well as new using ways (Scullica & Elgani, 2019).

Focusing on the individual and community wellbeing as one of the most crucial purposes of architecture and interior design, it is particularly interesting bringing up indications from a psychological point of view, which seems to highlight the need to take account of an ecological dimension as a convenient approach to an individual’s discomfort. According to Hillman (1999), the way to improve people is to improve their city. In an increasingly global and multi-ethnic city, where individualism is exasperated, new and more supportive relationships need to be enhanced, symbolically recreating a "village" dimension. It is a matter of designing not only spaces but places, not just "objects" but relationships: the challenge is filling this gap at a methodological level and doing it with minimal resources.

A right to the city should be formulated as a right to a transformed and renewed urban life, to be achieved through a re-appropriation of times and spaces of everyday life, a new configuration of social, political and economic relations, starting from a new approach to the design of urban environments. Two key principles should be regained: the individual citizen identity and the consequent possibility of dwelling the city. The re-signification of the urban space should take account of the relationship between people and built assets, as well as of the environmental effects on the individual emotions and behaviour. Beyond a traditional architectural aptitude, focused on single specific aspects, a contemporary design approach would address space/service systems, aimed to achieve more complex, multifaceted experiences. A design approach can be an important element of connection between knowledge areas, experiences and research carried out in different contexts and with different types of tools.

2.1 Urban reuse

The urgent need to stop the systematic consumption of land, energy, built and natural heritage, calls for increased attention being given to the potential of existing assets for both housing and experience (Pileri & Biondillo, 2015). Potentially, some spaces, often characterized by relevant historical architectural features, can become an effective resource by providing hospitable interior atmospheres; according to a virtuous European approach, they could give support to initiatives addressed to "revitalize" neighborhoods, guaranteeing an effective protection to the territory.

Often, the need to reuse existing spaces, fostering the communities cultural development and raising social cohesion collides with a lack of specific administrative tools, with a consequent risk that best practices could result into gentrification process (Marini, 2015; Dal Borgo et al., 2016).

When acting in ancient contexts, the research of new values of character and atmosphere inevitably finds itself involved in the exploration of the authentic vocation of places, in a dynamic interaction between past and future. In present time, an excess of building destruction is the equivalent of a loss of memories and images (Giannattasio, 2017). A challenge for newly designed spaces to be really audacious can be grafting in the old, thus engaging in a continuity and dialogue with it (Truppi, 2011). Existing buildings, landscapes and cities are palimpsests of memories, theatres of private and collective lives that have developed over time. Research in environmental aesthetics shows that people generally prefer historical places to modern architecture since they create a sense of continuity with the past, embody the group traditions, and facilitate place attachment, intensified by awareness of the place history (Lewicka, 2008).

Places remember through their monuments, the architectural style of their buildings, inscriptions on walls, etc. (Lewicka, 2008). For people who reside there, the traces play the function of “urban reminders”, the “mnemonic aids” to collective memory. Memory and imagination make people live in a tangible as well as in an intangible dimension, both contemporarily necessary to put them in relation with their past and projected into the future. In this dimension, physical reality and the narrative capacity of places are especially important. Therefore, existing buildings take on a strong civic value, allowing people to keep their common memory alive.

Therefore, whatever the scale of intervention, design in existing contexts has to deal with the fascinating and challenging persistence of memory and with the meaning that people have given to places over time. Design in existing contexts requires a special sensitivity and a deep critical capacity in calibrating the intervention such that, at the same time, the materials as well as their associated values are respected (Anzani & Caramel, 2020).

In order to link research to practical needs and user demands, design processes should include relevant parties in urban projects, building partnership with stakeholders such as policy makers, users, business, and local communities.

2.2 Care in the urban contexts

Recent research questions the capacity of the Smart City to improving individuals' living conditions and, at the same time, discusses it from a democratic point of view, due to the possible exploitation of people sensitive data. Other characteristics could be emphasized to "go beyond" the concept of Smart City, that can positively shape its future: "resilient", "flexible", "circular" city. Resilience gained the attention of the United Nations, which launched the "Making Cities Resilient" campaign (MCR) through the United Nation Office for Disaster Risk Reduction (UNISDR)[8].

Towards an advanced meaning of wellbeing in the urban contexts, the emerging topic of care highlights its potential relevance for the future generations and outlines the contribution that design, with a specific focus on the interior design approach, can offer to post-industrial society. Care involves an affective component, a benevolent predisposition to someone or something, a sense of respect and an awareness of the intrinsic value of objects and spaces. Therefore, the act of caring can become emblematic of a positive mode to address places. A strong appeal to civic responsibility seems necessary today, as there is an urgent need to protect against situations of abandonment and degradation, generated by administrative negligence and financial constraints, and in response to the sense of alienation that pervades contemporary society (Anzani & Caramel, 2020). In fact, design education and practice can generate a positive and sustainable impact on future communities if supported by specific tools based on a new interpretation of contemporary and emerging needs.

Flexibility is an environmental protection strategy as well as a way of taking care of individual needs. A circular economy concept is fundamental under different points of view. First, it refers to the economic cycle, which aims to the progressive limitation of waste and the reuse of materials, at the same time creating new industrial and job opportunities. Secondly, it refers to the holistic (circular) perspective, which highlights the interdependence between environmental, economic, and social plans, precisely within the framework of a circular economy. It worth considering that, for the first time, no. 11 of the Sustainable Development Goals has included cities among the key players of sustainable development. Besides, this is put in relationship with other goals, i.e., obtaining a quality education, promoting inclusive and sustainable economic growth, employment and decent work for all,

[8] https://www.ispionline.it/it/pubblicazione/beyond-smart-city-sustainable-city-22054

and building resilient infrastructure, promoting sustainable industrialization and fostering innovation[9].

The relations between external, environmental and design elements and internal, psychological dimension of the citizens and users should be taken into due account. A particular aspect of life quality which is often discarded as secondary, but has instead a strong valence for health, is sleep quality. This aspect of life quality is relatively simple to measure and assess; yet, together with other data related to social aspects and activities in social networks, it provides a strong insight on people's conditions.

Considering that wellbeing can be measured through psychological and neuroscientific tools, a transdisciplinary holistic perspective should be adopted to approach the connections between happiness, meaningfulness, development, the protection of the environment, social inclusion and social justice.

As more and more nations are learning, economic growth alone is not enough to produce happiness and part of the unhappiness results from the enormous inequality in the distribution of global income. The need for a new humanism should consider that we are beings in which minds, bodies, environment and culture are connected at different levels. Dwelling as a basic human action joins people and environment: it begins with the possibility of controlling a portion of space and involves both the tangible dimension of physical places and their mental representation. The paper ambition is to promote knowledge and creativity as major cultural and institutional bases of human communities, to endorse care as a guide attitude to fragile, unacceptable and rejected aspects of individuals and communities, to re-launch an aesthetic, creative, design-based approach to urban and community relationships.

3. The needs of the young generation

Because of the limited power of local administrations, a top-down process cannot take place without a bottom-up participation, which pivots on the awareness and involvement of communities and individuals. Young people live a significant evolutionary dynamic phase. On the one hand, this creates increasing opportunities for experiences; on the other hand, it increases uncertainties. Indeed, young adults seem now particularly vulnerable as they report increasingly higher levels of depression and anxiety. Understanding young people's needs for the future, with a particular focus on their personal satisfaction, could be a useful strategy to make them feel protagonist and to engage their great potential for social change. In particular, it is important to understand what meaning they attribute to their own wellbeing, and what possibility they have to transform it into action (Maggiolini, 2017).

Young adults' generation is particularly meaningful because they represent the decision-making and active citizens for the future urban contexts. They are peculiar in that they

[9] ibidem

represent a transition generation between two ways of living and interpreting the world, separated by the advance of new technologies. Their way of reading and interpreting the world could reflect their position and therefore differ consistently from that of previous generations. This has repercussions on a personal and on a policy level. At the level of the individual this could define different ways of defining the best actions, in terms of policies, to reach necessary individual and social change. Developing cross-disciplinary concepts combining universal design of ICT with pedagogy for educational, communication and social purposes could complement and support a design approach. University city-campuses may offer opportunities for lifelong learning pedagogy and meeting points for research-based, multi-disciplinary and international student projects addressing the urban challenges.

Research proposals and bottom-up design processes with a profoundly multidisciplinary approach may involve students' organizations, incoming students from Erasmus network, young workers and entrepreneurs involved through the alumni's networks as well as through start-up incubators.

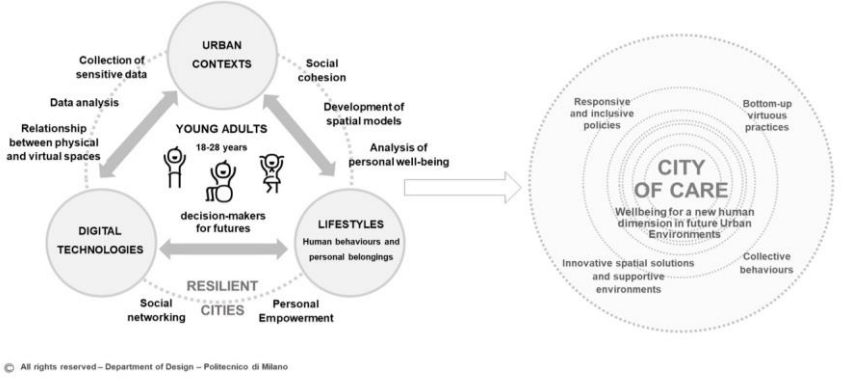

Figure 1. Involvement of young adults and design aspects in the City of Care scenario.

4. The role of interior design

Research in interior design at different scales of intervention spans over a broad field, including internal and external spaces, places, anthropic landscapes, thoughts and things. The starting point of a design vision is the human dimension with all its sensitivity and perceptive qualities. Within the design disciplines, contemporary challenges have led to an increased focus on the urban environment. Environmental and architectural psychology as well as the discoveries in the neuro-scientific field have made scholars, local companies and institutions increasingly aware of the opportunities offered by a human-centred design and

opened ever more stimulating perspectives to the design of welcoming spaces. The use of design practices, historically open to a dialogue with other disciplines, can be an important element of connection between knowledge areas, experiences and research carried out in different contexts and with different types of tools (Branzi, 2010). Aimed to seek innovative solutions in the project of development and growth of urban spaces, fundamental contributions could be provided by outlining specific characteristics of urban places related to living, working, travelling. A special attention should be given to healthy sleeping, dwelling conditions and personal relax time, which represent a relevant aspect in the everyday urban living across different people (students, working or occupied/unemployed persons) (Elgani & Scullica, 2020).

In the "city of care", this attention to younger people (age 18-28) could take place in two different ways: first, interior design should "cure" many of the meeting spaces, relationships, work, hospitality, exteriors and interiors, paying attention to the flexibility of the spaces (central theme today) to the technological equipment, (technologically "augmented" spaces) to the sustainability of the spaces themselves, and to inclusion, balancing, at the same time, the relationship between privacy and sharing.

In this regard, on the one hand, individuals need "relational" spaces in which to interact and exchange experiences, fundamental both for recreational-entertaining events and for work-related activities (this relationship is increasingly expressed by the term "bleisure" (business + leisure). On the other hand, more and more areas are also needed in which (work or entertainment and leisure) activities could be carried out in a private dimension. Every place of contemporaneity involves this type of “balance”, especially in a context where "hospitality", "inclusion" and "care" of subjects are important elements, as highlighted here. All spaces must also be adequately flexible, not only for the different activities to be hosted, but also for the microclimate, lighting and sensorial components in general (Caan, 2011).

Second, beside a general orientation of interior design should guide the definition of all spaces (architectural and urban ones), it may be desirable that specific “spaces of care”, according to the features defined above, would be created within different contexts in relation to specific places, in external and internal areas. Therefore, a more abstract spatial "model" should be studied and developed, to be then declined in different contexts and places, internal and external: from its presence in work spaces, to that within green spaces. A typology of spaces from which this model could take inspiration would seem to be that of "lounges" with a high level of comfort (for services, furniture, materials, sensory components, microclimate, ...), where you can carry out activities in the name of "bleisure" in a dimension of safeguard and individual "protection". This type of space has long been synonymous with "exclusivity" and the prerogative of a few (e.g. airport or hotel executive lounges), but in the contemporary world the model must also adapt to less "exclusive" situations, involving a plurality of subjects, according to a more democratic approach.

The approach will obviously have to be declined in different situations, and to be reconciled in function of specific spaces with their different peculiarities, activities, services and needs,

always strongly relating to the users requirements according to a "human centered" approach. At different scales, technologies as an essential aspect should be used for the individuals, avoiding a "neo-mannerist" approach.

As pointed out in paragraph 2.2, sleeping and relax are relevant aspects of healthy conditions[10]. Many "relational" components of the sleeping dimension obviously reflect on the quality but also on the different sleeping experiences. From sleeping alone, in a “personal” and specifically dedicated functional space, to sharing this space with other unfamiliar persons (hospital rooms, airport lounges, hostels or spaces for work/offices), or with "partner" persons during recreational-relational activities, or with friends in different situations (night rest, work breaks, trips, ...). Of course, the project of spaces, equipments and furniture systems both in private and in public spaces is a very challenging theme for the Design process.

Another crucial topic is the increasing importance of green spaces and green areas in relation to very different types of spaces: according to the advantages that green areas can guarantee for the individual, not only the presence of particularly large spaces and green areas, of course, adequately equipped is hoped for, but the "contamination" of green areas with architectural artefacts and also with entire cities[11] is becoming increasingly evident. Furthermore, the model must always adapt itself to the characteristics of the place so to be somehow representative of its culture, history, identity according to a "glocal" approach: an approach that today seems indispensable in an excessively globalized international context. In the development of the model, but also in its declination in different functional contexts, the participation of users in the design processes appears to be important according to a co-design approach (Rizzo, 2009) to avoid excessively "bottom down" choices and solutions and to make these spaces truly meet the needs of individuals.

[10] https://esrs.eu/

[11] as in the projects curated by the Stefano Boeri architecture studio for many architectural and urban projects designed and built in Italy and internationally.

5. Conclusions

Design seems to provide a key contribution to human everyday living in urban contexts, given its capacity to connect different knowledge areas and to propose reliable scenarios to improve dwelling conditions. A great responsibility of the design approach is stimulating a positive tension between spaces, times and new individual behaviours. It means identifying well designed solutions for the community, and not only for a single individual, also in relation to temporal structures and to ever more rapid and disruptive transformations (VV. AA., 2014). Building a welcoming and intimate dimension that can give care and comfort, even for a short time, to the individual is one of the most important challenges for the near future, whether it concerns collective indoor or outdoor spaces (Pimlott, 2018). Considering the topicality of this subject, an involvement of the final users in the design process, according to a co-design methodology, is unavoidable. A new humanistic approach seems to be more and more necessary for the design of spaces, service and technology in a contemporary and future urban context: in a more inclusive society, technology and economic development have to be considered as mere tools and not as final goals.

The power of designing choices.

Raffaella Fagnoni

Università IUAV di Venezia
raffaella.fagnoni@iuav.it

Abstract | Design has gone viral, all of us today are aware of the responsibility that design has taken on the challenges and crises of our time. After some considerations on these issues, the paper introduces the work carried out by "La Scuola Open Source" and in particular the XYZ2019 experience, and it deepens its methods and processes. A different kind of attitude emerges, balancing a state and quality of "being close" (proximity) and a dynamic encounter that provides energy (collision). The paper identifies some possible paths that match this way of acting. Is a trend inversion possible compared to a past that is no longer repeatable? Inversion defines something that is in-versus, against the common thing. It seeks the novelty by changing the verse: the newness has a subjective concept that includes individual experience and the power to design choices. 1#Introduction; 2#The world has changed; 3#XYZ2019; 4#The Affective in Design; 5#Conclusions

KEYWORDS | SOCIAL DESIGN, MAKING/HAKING, INVERSION, PROGETTARE NEL CAOS

1. Introduction

Design has gone viral and “has swallowed the world” (Gerritzen&Lovink 2019, p.33) it is everywhere. Compared with other disciplines, in the last seventy years, it passed from a semi-handcraft professional activity to a discipline with multiple different declinations. Private and public schools have sprung up everywhere, directions and areas of application have grown, stressing out borders. And all this with the crisis and the decline of other parallel fields. Where designers were once known for their ability to shape stuff, creating visual feature and appearance of goods, nowadays they work on a lot of different specializations including material or immaterial application, artificial intelligence, services, organizations, government agencies, territories, and so on. Nevertheless, how many of them are aware of what they do, of the social responsibility they have, thinking about sense and content as well as a form? The topic of design responsibility has been always part of design culture, as many experiences and authors testify: The First Thing First Manifesto (Garland, 1964), the Real world of Papanek (1970) aware of sustainability, social justice, inclusion and people's real needs; the focus on the human environment, the effort and designers’ role in the process of social change (Maldonado,1970); the designing to nurture and educate good citizenship (McCoy1993). The designers’ work requests to shift beyond issues of form and function to those of society and culture (Boradkar, 2004) also, as Mau, emphasizing the most positive side of capitalism, its ability to innovate in a socially responsible way, as a 'massive change' (Mau, 2004). Designers occupy a dialectical space between the world that is and the world that could be, they formulate a role as change agents and determine a course of action (Margolin, 2007, p.4-5) Despite the growing success of the responsible design movement, the industry is still perceived as often irresponsible, prioritizing profit and market share in the attention economy over consideration or accountability for harmful social consequences (Heller & Vienne, 2018, p.135 Kindle Ed.).

From the micro to macro, following the complexity of a multiscalar approach, new generations of designers adopt a systemic point of view, combining the detail with the big picture, investigating the physical and social, outlining critical issues and potential, experimenting the relational aspects between the form and structure of every kind of artefacts and situations. The “Emerging design” (Manzini, 2015) is a way of interpreting design and designing that is not yet mainstream, but that is expanding. It is a problem-based, solution-oriented design, defined not by the products, services, and communicative artefacts it produces, but by the tools and methods it uses. The focus of emerging design has shifted away from objects and toward ways of thinking and doing, becoming a means to tackle widely differing issues. It shifts from traditional, product-oriented design processes to a process for designing solutions to complex and often intractable social, environmental, and even political problems. (Buchanan, 1992; Cross, 2011; Manzini, 2016). “Design seems to become a lubricant for any social process imaginable” (Gerritzen&Lovink, 2019, p.14) but also the outcome of "Design as Collective Intelligence" (Di Lucchio&Imbesi, 2017; Frascara&Noël) combining the designers’ personal intelligence with the collective knowledge of the society.

2. The world has changed

Design has not changed: the world has changed, (Fagnoni, 2019) and Design has adapted itself to the different conditions, not necessarily limited within the confines of the formal definition of the product but extended as a driving force of human actions and activities in different fields of material and digital production. It is undergoing a momentous change (Margolin, 2015). The consumption collapse, in the era of the post-industry, post-metropolis, together with an unstoppable process of social and environmental ruin put us in front of the failures of the previous ones.

> "In the most narcissistic age in the history of humanity, the human-centred design reflects an antiquated and anthropocentric vision of reality. It is time to remedy with a good dose of altruistic and allocentric design" (Antonelli, 2019, p.21)

Almost thirty years ago Katherine McCoy invited designers to break out of the obedient neutral servant to industry mentality (McCoy, 1993, 2019, p.140), and Mike Monteiro has reiterated the same concept, describing how design has ruined the world (2019). The conditions have changed and consequently the purpose of the design projects. Previously industrial design concentrated work primarily on physical products. Today many of the designers' activities aim at the organisational framework, social problems, interaction and services. While during the last decades the territories and boundaries of the discipline have become frayed, the progressive transition from analogic to digital has transformed the design context. The radical changes we are experiencing, ecological, social, economic, technological, require now strong and decisive choices.

Design, as the discipline of making, always places the practical attitude ahead of the theoretical issue, and theoretical thinking always puts practice at the centre. This approach, certainly valid in the past, doesn't mean it could be the same for future designers (Fagnoni, 2018). As people who act, agents of change, they don't qualify as originators of chances through the possession of certain notional knowledge, but through operational skills, the ability to operate solutions. The Design professions are changing, adapting to the world that is progressively transformed. Laszlo Moholy-Nagy said "designing is not a profession but an attitude" and inspired by this statement Alice Rawsthorn titled her latest book (2018) offering a careful and current analysis of the new designer generations. Thanks to this attitude, they find themselves working in an independent way to face the great global challenges of our time, to which many of the systems and institutions that have organized our lives in the last century are no longer able to answer. (Fagnoni, 2019)

This happens by connecting with other's knowledge, interacting with the territory and its inhabitants, through inclusive practices of listening and co-design. The awareness emerges that it is necessary to consume fewer resources, also from an economic point of view, and at the same time designing for the triggering of new economies. Given the magnitude and quickness of the changes in society and its organization, as well as the emergence of disturbing elements within ecosystems, it raises the need Design Culture to consider a

holistic approach, to create a 'dialogic dialogue' with the local context (Manzini 2016) to nurture the spreading of active citizens.

3. La Scuola Open Source (SOS). XYZ2019. "Progettarenelcaos"

SOS is a private association[1], recently became a Worker Cooperative, whose members can be part of the staff, teachers and/or researchers. They define themselves as a community of digital craftsmen, makers, artists, designers, programmers, pirates, dreamers and innovators; a solidarity ecosystem for social, cultural and technological research and imagination; a space to the transformation of the existing. The founding nucleus, based in Bari, has expanded with a community of people scattered throughout Italy. A rich portfolio of educational activities combines who needs to learn something and who offers teaching about something[2].

As they claim on the website[3], they aim to follow the founding principle of Plato's Accademia: 'a free individual should not be forced, as a slave, to learn any discipline'; they consider Design as a 'catalyst to collectively redefine our relationship with reality', envisioning things for how they could be, altogether. They organized their School's structure to co-designing its teachings proposing openly, allowing anyone to evolve each of its aspects with time, based on learning by doing, do it yourself, opensource, hacker ethics. Learning from Nassim Nicholas Taleb (2013) they are building a model capable to adapt to mutations and making good of any erraticism and change happening.

Courses, lessons and workshops deal with a large range of contemporary topics, about design-related disciplines. They developed an original format called XYZ of which they steered 6 editions in different places. It concerns a methodological tool for knowledge sharing, an immersive, cooperative, multidisciplinary research and co-design lab. The focus is on crossing common problems to find connective solutions, inspired by the hacker learning process and principles (iterative, open, nonlinear, cooperative, informal, ethical).The XYZ2019 edition, named *Comunità Eretiche*, involved almost 100 people, among researchers,

1 Founding members were thirteen guys, their manifesto is available at the website: https://www.lascuolaopensource.xyz/en [accessed December 1st, 2020]. I knew them in 2015. Right from the start, they expressed themselves as a disruptive group. They have grown their program by working several handed, in a closed Facebook group. Each participant could share and contribute to edit the documents. Their first business plan has resulted in the actual SOS configuration.
2There are six thematic areas: teaching, research, care, hackerspace, communication, sustainability. The educational activities are available here https://www.lascuolaopensource.xyz/en/teachings [accessed December 1st, 2020]
3https://www.lascuolaopensource.xyz/en/manifesto [accessed December 1st, 2020]

teachers and designers working together with the inhabitants in the former convent, a disused complex of 6,000 square meters in Cerreto Sannita.

Table 1. XYZ groups Focus and Sense. [_DCs Table title].

	focus	sense
X team	Identity, Strategy Communication Design Propaganda	X is a cross, the opportunity for a dialogue
Y team	Tools, Hardware and Software, Making/Hacking, IoT	Y is a fork, the opportunity for choice
Z team	processes, service design, governance, UX	Z is a road, a trip in divergent directions

Here, Guido Lavorgna and Raffaella Vitelli, with their local association Convento Meridiano, carried out an extraordinary undertaking: once obtained the thirty-year concession for the use of the convent spaces they proposed a project, thanks to which they won the fifth edition of the Culturability call - regenerate spaces to share. Accordingly, they invited La Scuola Open Source (SOS) to organize a research and co-design workshop.

The XYZ2019 goals were ambitious: to co-design the communication strategy and the visual identity system (X), to reorganize spaces and work on IoT grafts in the structure (Y), to develop a governance model, design services, and deepen the economic sustainability (Z) of Convento Meridiano: kindergarten, cinema, laboratory and space of possibilities; an epicentre of social and cultural transformations.

The SOS staff invited directly teachers or tutors and proposed an open call to pick participants. Confirming the importance of design's aptitude rather than expertise's, their selection criteria didn't relate skills or profiles, but the personalities. Some students, philosophers, pedagogues, engineers, designers, architects, economists, makers/hackers, service designers, participated. Sketches and notes below try to describe and model this experience, offering methodological thinking on the heuristic, experimental, intuitive, analogic practices, and tools used during XYZ2019. The coordination team proposes the overall plan. It allocates the goals throughout the laboratory to achieve the expected results. Starting from a shared input in a common meeting (1) the group (X, Y or Z) works in small subgroups with horizontal dynamics (2) involving internal and external actors. After each working session, the group meets again, share results and proceed with the progress achieved (3). The members of the subgroups learn, teach and produce by a mutual exchange relationship (4). They carry out small businesses useful also for other subgroups. As the days pass the subgroups are combining differently, often mixing their groups of original belonging. Everything happens in a fairly fluid way, based on skills, attitudes and interests. The work progresses through a continuous exchange flow and interactions that inspire self-training.

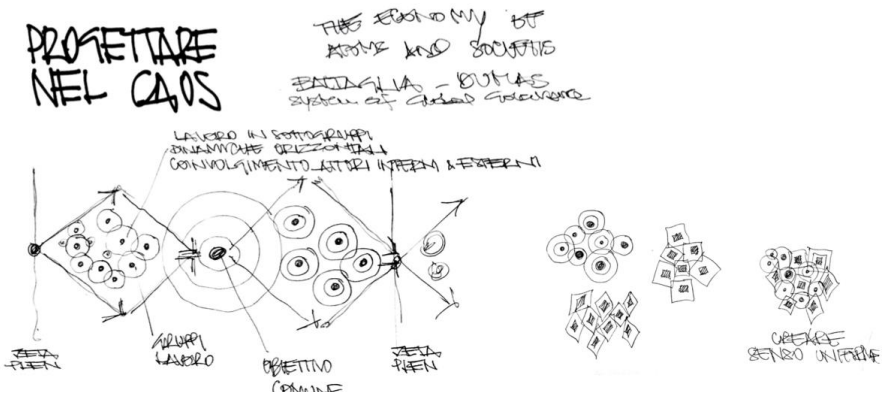

Figure 1. Processes and flows. An articulated relationships system assumes a chaotic behaviour when it does not follow strictly linear laws of evolution and development. Participants behaviours, after a certain time lapse, are atypical and almost unpredictable. Flows seem to lack a correlation between the subsequent steps; however, they are never random forms. [sketch: Raffaella Fagnoni]

Everything that was produced and shared during ten days of immersive and horizontal work, follows the wake of the ad hoc approach enhanced by the American counterculture in the '60s. Bennis and Slater (1968) indicate it as a new system of network relationships, more flexible and responsive. Adhocracy contrasts the model of pyramidal relationships with a rhizomatic one, proposing horizontal development and interchange. While the bureaucracy model follows the practice of imposition, that of adhocracy respects the practice of the proposition. The model of bureaucracy is autocratic, according to a vertical arrangement, while the approach of the adhocracy is collective with a rhizomatic development.

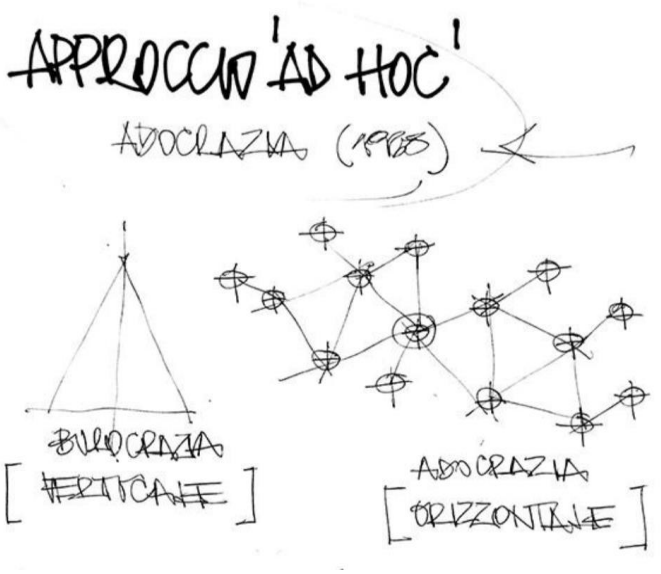

Figure 2. Adhocracy vs. Burocracy. [sketch: Raffaella Fagnoni]

With the term rhizome, the Frenches Deleuze and Guattari define a particular semantic model to be opposed to all models based on the tree concept (prevailing in all disciplines). The tree model provides a hierarchy, a centre, and an order of meaning, arranged in linear order. Instead, according to the authors, unlike trees or their roots, the rhizome connects any point with any other point, and each of its traits does not necessarily refer to traits of the same gender, staking very different regimes of signs. Compared to centric or polycentric systems, hierarchical communication and pre-established links, the rhizome is an acentric, non-hierarchical and non-significant system. (Deleuze &Guattari, 1997, p.33)

The design process (ProgettarenelCaos) is based on people enhancement and their movement autonomy, taking advantage of coordinators and teachers that act as moderators, activators and synthesizers. They behave as leaders and steering an irrepressible flow that otherwise risks overflowing. The Chaos is not an uncontrolled disorder but a generative context. It appears as a kind of harmonious anarchy in which the individual subjects, following a stream of effectiveness, organize themselves by units and positions during the work evolution. They generally maintain the same role and disposition until they

complete a specific work package. All the produced outputs are downloadable on the SOS webpages[4].

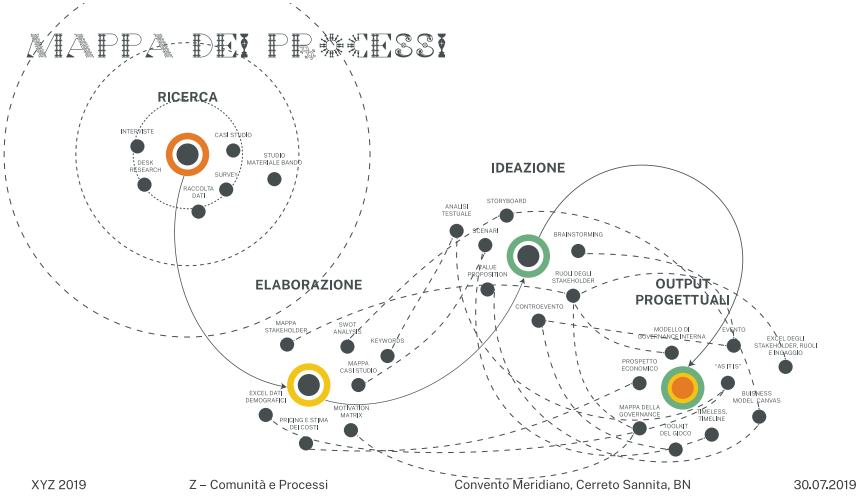

Figure 3. The map designed to show the XYZ process. Group Z, Scuola Open Source

The development of the works follows a step-by-step process, during which XYZ groups and subgroups act and proceed with multifarious interactions and connections. They are designing in the chaos, as a generative process.

Figure 5. Life and work at XYZ2019, Cerreto Sannita (Ph: Raffaella Fagnoni)

Measuring project results. Just like the most creative projects, also the XYZ2019 experience has results that are both tangible and intangible. The tangible ones can be directly verified by measuring the effectiveness of what has been done. The artefacts and services designed for the structure and local stakeholders remain as assets of the group that manages the Convento Meridiano who are using them.

Quantifying the intangible results is less easy, but we can monitor and observe them. This is a first attempt to take advantage of the experience gained and to explore them:

- the sense of empowerment of each member of the group;
- the immersivity in the local context;
- the higher performance in a mix of skills;
- the trust in people;
- the positive rebel attitude (as makers/hackers)

All the practices, to operate for tangible results, focus on human relations and obtain as an added result to the expected final outputs also the design of a community, since the developed relationships move between proximity and collision. On one hand, the state and the quality of *being close*, proximity, permits participants to share and integrate skills in the multidisciplinary group, with stakeholders and by living the place. On the other hand, the *dynamic encounter* between people and activities, that often collide, intensifies the energy. The affective and aesthetic components become a fundamental insight into an immersive designing mood.

4. The relevance of the affective

The state of "being close" highlights the affective component as the quality of projects and design processes. Empathy and attention to relationships make the results more effective. In general, the objects of design culture and also design activism are affective, designers provide intensifications that give materiality (Julier, 2019 p. 341). This affective component, however, does not only refer to the formal aspect of product design objects. As Norman stated some time ago, emotions have a crucial role in the human ability to understand the world and to permit learning new things (2005).

The emotional and sensitive component extends generally as an attitude of the project. We can also find it in the design of reuse and regeneration of spaces and situations, in place-making actions, in the staging of performances or other events, in the performance of contemporary design practices. Today many design projects come up with installations whose meaning is above all to raise awareness and make people reflect on the critical issues of our time in order to induce change. Figure 4 shows an example on the theme of human interactions mediated by new technologies in the framework of the Sencity Festival, Montpellier, 2018. The passage from a individuals' community to the connected community.

Figure 4. Montpellier, Fav 2018, Sencity. Design Installation, "Inter/Faces", a cura del Team Università di Genova, Master Degree in Product and Event Design.

In similar cases design works in a process of co-articulation. Here objects function as a *materialization of participation*. They facilitate a performative engagement in public life without disembedding from the everyday. (Julier,2019 p. 339)

The designer activist is working in a more open-ended way that goes beyond the materialization of the design. The implementation also involves a series of re-designs that doesn't necessarily mean that the design reaches an optimum point. Philosophically, of course, this has resonances with the notion of wicked problems (Rittel&Webber, 1973). The designers remain embedded with their public, their responsibility becomes a shared one, and one that gives space for the designers to usefully contribute their expertise while engaging users in taking on and continuing to develop results. (Julier, 2019 p. 339)

Design today plays such a dynamic role in so many areas. Historically, finding positive applications for new technologies was one of the key roles of design and will continue to be as technology is advancing at an unprecedented speed and scale. (Rawsthorn, 2018) A flow of new technologies promises to become part of our daily lives - quantum computing, neuro-morphing computing, including artificial intelligence, crypto-currency - and people do not always consider them positively. We frequently read stories about artificial intelligence, which, if poorly designed, can cause a considerable amount of damage. On the contrary, if we provide it intelligently and sensitively, it can help to solve problems. Designers will be fundamental in finding positive and beneficial applications for these technologies and have an incredible opportunity to identify them. The affective side takes on a considerable role in this dynamic. However, we need to balance these practices with those involving people. Here some paths to ride:

4.1 Inversion

Inversion is an exercise about shifting the constituent elements of a speech into an arrangement and overturns the normal syntactical structure. It can be based on a shift or a pass from one state to another. Anyway, it is similar to error understood as a possibility for the change of perspective. Many past philosophers, from Plato to Saint Augustine, from Descartes to Heidegger, challenged the idea of error in the search for truth. Error is one of the figures of thought involving practically all fields of human knowledge (Donà, 2012), adopted by pedagogues as a fundamental aspect of mental construction and an integral part of learning (Maria Montessori, Gianni Rodari, Loris Malaguzzi, Bruno Munari), an occurrence for important discoveries in scientific research (e.g. penicillin, Alexander Fleming, 1929). Inversion refers to something that is in-versus, against the common thing, against habit. By changing the verse, it seeks novelty, what is new in a subjective level, a concept that includes the experience and different from that of innovative, related to something that was not there before.

4.2 Craving for craft

Outside the maker spaces and fab labs, designers try to work hard to create authentic and craft-based processes. A craving for craft (Gerritzen&Lovink, 2019) diffuses practices hacking of the technical complex objects that surround us. The outlines of a novel post-digital craft appear. More than ten years after Sennett's book success (2008) good hands have regained

vigour, although electronics, computer science and artificial intelligence dominate and dematerialize customs and traditions. The good hands (virtuous, technically skilled) are also good hands (polite, doing right). These practices recover the culture of proximity between the local workers, the local economies and emerging designers.

The more interesting craft activities concern more developing products/services rather than producing traditional products because these activate alternative processes at the productive, social and economic level through the creation of startups. Through self-production, we enhance our traditions without losing them. Craft permits also to work with the local community. Even on an educational level, an alternative pathway exists. It starts with the analysis and choice of a problematic context. The following research phase evidences the peculiar aspects permitting to identify a project direction. Finally, a concept takes shape and a product/service of which a final model result.

4.3 Reuse and Recycle as Destiny

Reducing, reusing and recycling seems to be the only sustainable social strategies capable of expressing innovation, generating consensus and producing beauty. Recycle creates new value, a new cycle, another life. Recycle is an ecological action that operates pushing the existing into the future by transforming waste. It is not interesting to adopt recycling paradigm because it is an ethical action, good and right, but for the reason that today to recycle is to design. (Fagnoni, 2016)

4.4 Ecological Consciousness

Ecological consciousness is something that requires a radical rethinking of everything. First of all, of the term ‘society’, that must necessarily include also non-human entities: flies, cats, trees, oxygen. Social space has never been exclusively and totally human. We live in a biosphere, which today is becoming fragile and thin as a sheet of paper. (Morton, 2019)

4.5 Limit neoliberalism

Design schools have so far been directed to develop the ability to make beautiful objects accompanied by the illusion that they improve people's quality of life. They pursue the modernist illusion of progress, as in the famous historical film To New Horizons[5](1940) which

5Produced by General Motors, the video documents the "Futurama" exhibit in GM's "Highways and Horizons" pavilion at the World's Fair, which looks ahead to the "wonder world of 1960." It narrates how Americans are always striving for "new horizons," and "new ways of doing things." and proposes an immense, miniature diorama designed by Norman Bel Geddes. https://www.youtube.com/watch?v=tAz4R6F0aaY [accessed February 13th, 2020]

presented the vision of an ever-better world, always growing with the unlimited progress of science and technology.

The typically neoliberal vision of the world largely denies the existence of any negative implications of industrial products and systems on the environment and people. The fundamental problem, from a design point of view, is that huge portions of industries are involved in both the creation and continuance of such myths, however defective they may be. Neoliberalism encourages the unlocking of future sources of value and how design cultures work within this. Likewise, a similar dynamic is the work in design activism. Much of the rhetoric in design and social innovation is directed at tapping into underused resources and freeing up their potential (Manzini&Jegou, 2005) thus there is also a future orientation in design activism. (Julier, 2019, p. 340)

4.6 Educating to Civic sense

Design is dealing with absolutely distant and different matters. This reality imposes today an exceptional commitment of intelligence, an adaptation ready to spread good practices if we aim for the power of designing choices. Yet, in recent history, with the latest reforms of the school and university system, the trend to lower the cultural offer to pursue educational success is gaining momentum. It focuses heavily on skills and less on theoretical disciplinary knowledge, in a sort of market between debits and credits. Certainly, the skills are useful, but it is unthinkable to reduce everything to kits of pre-set and repetitive formulas and models. In addition to basic skills, theoretical knowledge allows the development of critical thinking, emotional and creative intelligence, divergent thinking, the ability to autonomy and self-determination. These are not skills: they are knowledge that becomes part of learning and can be tools of emancipation.
The conference "Designing Civic Consciousness/ABC for the Reconstruction of Civil Consciousness" (San Marino, 2019) provided the opportunity to focus and debate on teaching, on the issues related to knowledge, democracy, and civic sense: that is the willingness to work for the regeneration of the social and physical quality of the context in which one lives. Its existence implies the presence in society of widespread mutual trust and a shared idea: the trust that if I behave correctly the same will be done by others. A shared idea of what is meant by 'correct behaviour'. (Manzini, 2019, p. 24)

4.7 Designing community

Community is a social group in which relationships, emotional ties, closeness and solidarity are the prevailing aspects. It consists of several units interacting with each other: territorial (the geographical, environmental, networked and structural features); social (people, relationships, institutions, services); economic (activities, forces, resources); cultural (values, norms, behaviours, meanings). More and more clearly, the solution of social problems becomes possible only by adopting flexible and decentralized modes of operation, in

contexts closer to everyday life and based on the promotion of mixed networks, understood as a system of co-responsibility between different subjects.

Designing the community means building a voluntary, light and open group in which the individuality of each one balances with the desire to stay or do something together. It means fluid communities, without which there is only the loneliness of the connected individuality, or the reactionary attempt to re-propose the closed and identity communities of the past which, even though they were so beautiful in the past, are certainly a past that will not return. (Manzini, 2019)

5. Conclusion

My purpose has been to take a trip, moving from the contemporary situation and exploring some directions, with the aim to investigate what Design we need and what Design we could teach today. We have the power to design choices and to nurture good citizenship.

We are facing a momentous change, that someone considers a planetary procession toward decay. The consumption collapse, together with an unstoppable process of social and environmental ruin, put us in front of the faults of the previous ones. The young generations are much more sensitive to these issues: they feel anger towards those who preceded them, thinking without any scruple only about their interest. The approach of La Scuola Open Source proposes a different vision for design attitude and design education. A new kind of institute, a young cooperative, opening new perspectives. The XYZ2019 experience offers an example of co-creation and co-design. Today, the activities produced by this workshop are carried out by local people. These practices are thriving in our times as a possible solution to bridge the gap between science, society, innovation and some contemporary human problems.

Two poles balance our life: a prosaic and a poetic part. The first one leads us to act by obligation; while the poetic frame integrates each aesthetic element in our lifetime (Morin 2019, p. 12). The wonder is the emotion of aesthetic feeling that spreads desire for sharing and intensifies enthusiasm (a beautiful word from Greek: en-inside- and thèos-god-, the god inside). A more powerful and intense mood occurs, rather than a simple excitement, a feeling of energy overgrows us. Each goal seems easier to reach and every obstacle easier to fight. A contagious mood opens the chance of realizing ideas or dreams. I think the SOS guys have a terrific power of designing choices and to contribute to diffuse good citizenship.

Designers actions and practices take place at three scales: the individual one, the groups one and the institutions one. The first, the individual, is the level of People, where recombine distance relationships with proximity relationships. The second, the group, is the level of Place, where to organise places as nodes of networks and not as closed enclaves. The third, the institutions, is the level of Economy, where to address the crisis of neoliberalism with the economies of caring and reusing. Through their choices and their tactical creativity,

designers are able to act and spread out the culture of proximity to intervene on the most urgent issues. The more people will be involved in these processes, the more opportunities will be developed to turn what is preferable into what is possible.

The systemic approach and the use of new technologies to communicate cultural heritage and develop a culture of proximity

Marco Faccini *[a], Alessandro Spalletta **[b]

* marco.faccini@inaf.it ** alessandro.spalletta@isiaroma.it

Abstract | Today the individual is a content producer, who can share ideas and merge creations at a global range in the fastest way. Anyone is a manager of pop culture. Anyone can visit cultural places and interact with others anytime, anywhere in real time. Several Institutions in Italy are "disconnected" from the contemporary changes. This research project was thought to solve this contrast, taking into account the modern scenario and the contemporary role of culture in the social and economic environment of the cities. The research was focused on the development of networks to spread knowledge and create connections within public, the territory and the social-economic actors. Each module of the projects is designed on the basis of the "culture of proximity": the public will be part of the project, interacting in several ways, becoming the content developer. Adaptive modules regard both architectural, design and technological aspects and several communication languages.

KEYWORDS | CONTAMINATION, SYNERGY, ADAPTIVE SYSTEM, OPEN GENERATIVE SYSTEM, MULTI-SENSORY COGNITIVE EXPERIENCE

1. Introduction

CULTURE: the way of life, especially the general customs and beliefs, of a particular group of people at a particular time.

HERITAGE: the history, traditions, practices, etc. of a particular country, society, or company that exist from the past and continue to be important.

PROXIMITY: the state of being near in space or time. *

*in Cambridge Dictionary

Usually definitions help to simplify and explain a concept, today, not these particular ones. Their meanings have never been more complex as nowadays. The “definitions” are so open to subjective interpretation and are so interconnected with several other concepts that it is extremely difficult to maintain a univocal meaning constantly. The fastness and speed of interactions and exchanges of data between subjects from every corner of the globe are challenging our understanding of the usual scenarios, they are introducing more complex realities and changing every moment the content of what we usually call Culture.

1.1 Cultural Proximity

In classical studies, cultural proximity has been connected with aspects like geographical distance, the exchange of goods or persons and the similarity of political systems.

As stated by Maznevski, Distefano, Gomez, Noordenhaven and Wu (2002), culture “is a group-level phenomenon, but it influences individuals’ perceptions, values and behavior, especially with respect to social interaction”

Cultural proximity can be defined and found in several areas of research.

With “cultural proximity” we can find define the term of the extent to which people perceive similarities or differences between two cultures (Babiker, Cox & McMiller, 1980; Wang, 2009). On the other hand, a different approach stems from Pool (1977) and Straubhaar’s (1991, 2003) work, presents cultural proximity as the notion that people naturally choose media that is culturally similar.

Babiker and colleagues (1980) developed an index that measured the perceived similarities between two cultures based on the following characteristics: “climate, food, language, clothes, religion, educational level, material comfort, family structure and family life, courtship and marriage, leisure activities, and intergroup conflict”.

One of the most known applications of cultural proximity or distance is summarized by Geert Hofstede’s (1980) cultural index (Kirkman, Lowe & Gibson, 2006). This index involves six dimensions: individualism, power distance, uncertainty avoidance, masculinity, Confucian dynamism and indulgence (Hofstede, 1980; Hofstede & Bond, 1988; Hofstede, 2015). These dimensions range from the closeness of social frameworks, acknowledgement of the

inequality of power distributions amongst social institutions, adoption of preemptive measures to avoid deviant situations, and dominant as well as secular values in society (Kirkman et al., 2006).

In the last decades these indexes have been used to study, or to manage, scenarios in international trade and marketing studies, and also to explore audience predilection (Fu and Govindaraju (2010)). In examples, the results of the Fu and Govindaraju (2010) study contend that countries that are more culturally similar to the United States will also resemble Hollywood film predilection. Perceived cultural proximity was based on characteristics like shared language, food, clothes, religion and lifestyle (Babiker et al., 1980; Wang, 2009).

1.2 Pop Culture and a new Proximity

We are living in a rapidly changing world of communications, that has significantly shifted the dynamics of pop culture. Perhaps what's more interesting though are the new relationships it's created, between audience, publisher and brand.

New technologies allow us to manage an increasingly high amount of data (big data), to draw new relationships through the use of increasingly advanced processes, also thanks to the insertion of artificial intelligence. The speed with which we can generate new scenarios, expand our knowledge or keep in contact with everyone in the social world, gives us new and innumerable opportunities.

Everything changes in a bit also behavior towards culture and reality. These opportunities, these new "rules of engagement" modify, enhance, revolutionize the relationships between individuals, material and immaterial contexts and require new cultural paradigms.

In the last ten years we have witnessed the creation of new realities by information and communication technologies "The online digital world overflows into the offline analog world, with which it is mixing" .. "we increasingly lead our lives onlife ". (Floridi (2017), The fourth industrial revolution. How the infosphere is transforming the world.).

Daily life is divided between online and offline, the experiences we live are increasingly connected in a social life that takes shape, as our everyday physical life, in a way that we can no longer shoot down because it is part of our individual being and, at the same time, it is part of the collective life.

We speak of the fourth industrial revolution, of IOT (internet of things), connection between objects people and web, or at a higher level, according to the definition given by CISCO, we are now in the IOE era (Internet of Everythings) where the connection extends to all (M2M Machine to machine- IoT), M2P (machine to person - Data and Analytics), P2P (person to person - collaborations).

This was the backdrop to The Culture of Proximity study undertaken by BCMA members, Viacom Velocity – home of iconic pop culture media brand MTV. They set out to better

understand the fundamental audience attitudes underpinning this shift. The results are a clear

New centers of gravity: people have more power than ever. They also filter information in their social media feeds to see only what they want.

New intimacy: everyone is even “friends” with celebrities, messaging is just as personal as talking face to face.

New yourself: everyone chooses activities in real life that will give the opportunity to post something. The audience became the producer of the contents and the judge of the pop level they extend.

1.3 Culture vs Culture

The new globalized markets and their network entail new challenges for academics and industry practitioners. The cultural nuances are now of paramount interest, they may, or maynot, determine whether enterprises rise or flourish in global, national or regional markets. The current study is mainly concerned with perceived cultural proximity, the extent to which people perceive their culture as similar or different to one another, and levels of interaction about the marketing implications of these processes. With the onset of globalization as well as the internationalization of businesses, trading and media, recognizing the role of culture in these transactions becomes paramount in order to gauge and better understand emerging target markets.

All these studies seem disconnected from the usual idea of culture we have, the usual definition. Museums, cultural areas, cities of cultural interest they can not be separated from the changes of the modern age, they can not be “closed” to evolution or new needs of the public, they need to embrace the contemporary age and the changes and challenges the era is providing us. Thay have to be part of new scenarios in order to answer the collective culture, to build new connections with their audiences and express their potentiality. and, on the other hand, everyone wants to be POP, also the museums.

Marketing, big data, social media what do they really mean for the classical culture?

How does a city have to change its own traditional activities to answer the modern age?

How can we tackle the challenges of marketing and cultural dissemination without loosing control? Without falling into stereotypes and easy shortcuts to engage the public?

Modern technology has given the opportunity to the "Places of culture" to be part of huge networks, to be interconnected with cities and other cultural hubs. Museums, "Science Center '', cultural heritage areas, cultural tourism stops are nodes of these networks. Each one emphasizes the participatory approach with the use of interactive exhibits, encouraging visitors to experiment and explore. These nodes are spaces where culture is available to

everyone. Thanks to modern technologies they create increasingly dynamic and engaging experiences that allow the public to be more than part of a passive audience.

The research project we have developed was thought to answer these questions and suggest multiple solutions to the needs of a Cultural Institution, taking into account the modern scenario and the contemporary role of culture in the social and economic environment of the cities.

Two leading institutions in Rome, one committed on the field of design and communication, the second on cultural heritage, astronomy and science communication, have merged their experiences and needs to produce a two-year research project.

2. First steps: understanding the Scenario

Although technological evolutions make it possible to quickly exchange information and data in many places with the biggest audience, there are difficulties connecting and communicating Italian cultural heritage.

The Italian cultural heritage is huge and so complex. It is composed of buildings, museums, libraries collections, material objects and abstract compositions, everything interconnected with the cities, the history and the social and economic life of the country. All these materials usually remain in an indefinite state in time and space, hibernated and distant from the contemporary development of culture, they are incapable of being fluid and in continuous transformation (BAUMAN- La vita liquida) .

This is the local reference scenario that characterized the development of an interdisciplinary research project, "INAF Universe", developed taking into account the contemporary role that culture plays in the social and economic life of cities and the country system in which the use of technologies becomes a generator of new proximity cultures.

The research and exploration referred, in the first phase, to the area of Rome and its surroundings: a real, tangible scenario that allowed us to model the design choices starting from concrete references, represented by the elements of the system in terms of actors, places and relationships.

The contemporary cultural scenario taken into account is bigger and more complex than the local one, so the project started from the analysis of some cultural hub in Europe.

3. Objectives

3.1 Who is INAF?

INAF the National Institute of Astrophysics is the main one Italian Research Body for the study of the Universe. INAF is also the guardian of the historical astronomical heritage developed in the past centuries.

The first step to understand the strengths, the critical points and evaluate the "materials" to be used was to know INAF.

To understand INAF reality, a set of interviews to those who work within the research institute was organized. This allows us to understand the different activities INAF carries out in the field of astronomical research and its dissemination. We carried out a specific analysis of the means of communication that INAF uses, the contents and the media used to be presented to the various audiences.

INAF is the guardian of a heritage spread throughout the Italian territory in the cities hosting the Astronomical Observatories, represented by elements of the past, and historical places such as the church of Sant'Ignazio in Rome or the Casanatense Library. But INAF cultural value is not only connected to the past, INAF is involved in international research projects with high technological content in the realization or programming phase, projects of paramount importance to enrich scientific culture and knowledge. (i.e. the first images of Pluto or the first image of a Black Hole)

3.2 What are the needs?

INAF needs are related to the same needs that each modern research institutes pursue, the need to be recognized by the public and the wish to be connected with the public at large to disseminate the research that is performed inside the institutes itself.

Furthermore, because INAF is the guardian of a huge cultural heritage and plays a special role in the cultural environment of each city where an astronomical observatory is located, INAF needs to enrich its modern role of producer of scientific values, connecting the past and the future of astronomical research through its collections and the link with the historical places in the cities.

3.3 Which strategy?

This heterogeneity of contents and the complexity in narrating them was the first theme of the project activity of the working groups. The groups were represented by about 30 researchers, who through the design of the systems, responded to the emerging INAF needs with multiple strategies:

- enhance INAF's historical-scientific heritage on the local and Italian territory, starting from a flexible format, through adaptive actions capable of modeling the most effective communication strategies for the context of wintering;
- use advanced communication methods capable of reaching different audiences;
- intercept the different targets in the areas of everyday life, through the use of attractors specially designed as system nodes;
- choose advanced science and research themes, which will be capable of better explaining astronomical and astrophysical research.

3.4 Objectives

The objectives of the research have been defined and divided in two phases. The first phase of the work was dedicated to the Rome scenario, as a simulation context, then with the second phase, the project was extended to other Italian cities and Observatories.

A choice made because of the possibility of formulating strategies on a particular place like Rome and its "Astronomical" surroundings, full of opportunities and critical issues.

In particular:

- build a relationship between the astronomical places in the city, and the Copernican and Astronomical Museum of Monte Mario, in order to bring together different targets to enjoy the contents of the Museum and the surrounding area.
- identify "attractors" able to catalyze attention and convey messages more effectively (figure 1);
- take advantage of the characteristics already present in the area in terms of structures and services, to engage targeted design actions, for example by joining the nodes in the city but not connected, to quote Ezio Manzini "use the existing".
- Develop outreach interactive projects and the relative communication and advertising campaigns able to evolve in a short term inside the cities or the Observatories areas.

4. Methodology and development

4.1 First observations

The team was divided into working groups.

Researchers' observations highlighted some critical issues used as project guidelines:

- a lack of connection between the places of astronomy present on Rome territory;
- poor knowledge of the cultural places connected with astronomy in the most tourist areas of the city;
- difficulty of INAF to communicate itself and the cultural resources present on such a territory so rich in cultural, national and international values.
- the need to review the narration of the Copernican and Astronomical Museum in terms of interaction, usability and communication;

figure 1. Astronomical attractors

The observation and mapping of the activities on web platform, digital channels, public events on the territory managed by INAF, has allowed the research to underline a cultural system that is not so much known by the public at large.

Through dedicated questionnaires and interviews, interesting data emerged on the subject of this gap and disconnection that affects the recognition of INAF by an heterogeneous target. An even more evident problem if we take into account that in the area of Rome and its surroundings several astronomical institutions are established.

There are the historical observatories of the Roman College and the Specola Vaticana, the modern research centres of Monte Porzio Catone and Tor Vergata and in Monte Mario the national headquarters of INAF and the Copernican Astronomical Museum.

4.2 A "lens" for each objective

The results of the first analysis have made it possible to obtain the requested info:

- identify and map the nodes in the area, represented by the places relating to astronomy and the places with the greatest tourist turnout;

- highlight the elements defined as "attractors".

The attractors have been identified for their ability to be of high interest for the heterogeneous public and they were used, in the project, to convey the messages in a more effective and transversal way, through new AR technologies and network generation systems.

An example above all can be represented by Bernini's fountain of the Four Rivers in Piazza Navona; an important cultural attractor whose few know the relationship with the "world" of astronomy, which allows, through a dedicated App, to create alternative cultural routes to those known and proposed to mass tourism.

Figure 2. the App ASTRO connected with cultural attractors. In particular the Four River fountain. Bernini was a friend of one of the astronomers at Collegio Romano, A. Kircher, director of a huge museum, the Kircherian Museum. Inside the museum there was a strange monster, an armadillo, who inspired the image of the dragon at the basis of the fountain

4.3 Project structure

The project was carried out in a systemically way, starting from common lines that connect the public, history, cultural areas and widespread astronomical heritage.

During the first phase of development, which was established in the Rome scenario, some project elements were hypothesized according to define the system logic and a flexible model summarized as in the following map (fig.3), consisting of:

- a variable relationship area based on the reference area, within which to build a connection network between the different nodes of the system;
- the museum / historical location of the city observatory (s);

- attractors designed ad hoc and located in strategic places in the area of interactions;
- an interactive itinerant exhibition module, connecting the observers, the attractors, the cultural sites, in which to show historical and scientific contents, current INAF international projects, and contents generated by visitors through proximity social tools.

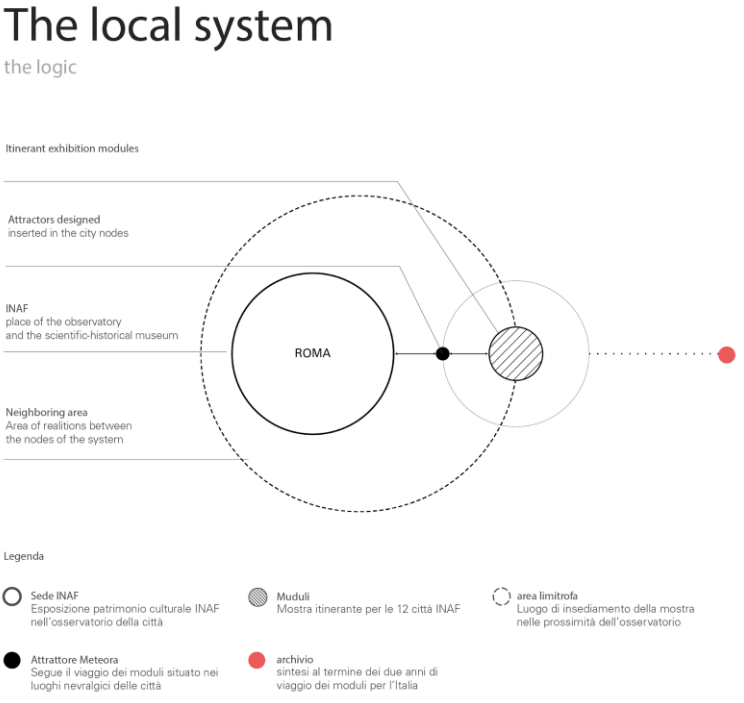

Figure 3. Local System

The research was focused on the development of networks, cultural links between "places of culture", astronomical places (in particular the Copernican and Astronomical Museum in Rome), art museums and public monuments. It also wanted to spread knowledge and create strong links with a heterogeneous public, the territory and the socio-economic actors.

The "Human centered" approach, and the analysis of the targets with the "Personas" tool made it possible to understand

- new tools,
- the routes the people plan and the services of the city with which they come into relation.
- the places where to intercept a differentiated audience, also if unaware of the cultural astronomical heritage available in the areas.

This systematic survey was useful to modulate the communication tools and where to set them, but also to select the most appropriate contents and engagement methods.

Starting from the structure and the elements of the system represented in the previous map, the research groups have defined, in addition to the common ones, different strategies to be applied.

4.4 System dynamics and its connections

The working groups involved in the project selected a certain number of activities and events to be provided to the public in cultural environments.

The architecture of the project involves several adaptive modules concerning architectural, design and technological aspects and different communication languages. It represents an organic system capable of adapting and modifying itself, through the direct involvement of citizens called to update the exposed themes and to reshape contents and interaction models.

In order to optimize the logistics and organization of the systems, as well as its sustainability, the nomadic strategy has been adopted.

The implementation of the adaptive system model in twelve cities has taken into account several activities in evolution according to the interests and feedback of the public involved. The selection or modification of the activities start from a dynamic and participatory experience.

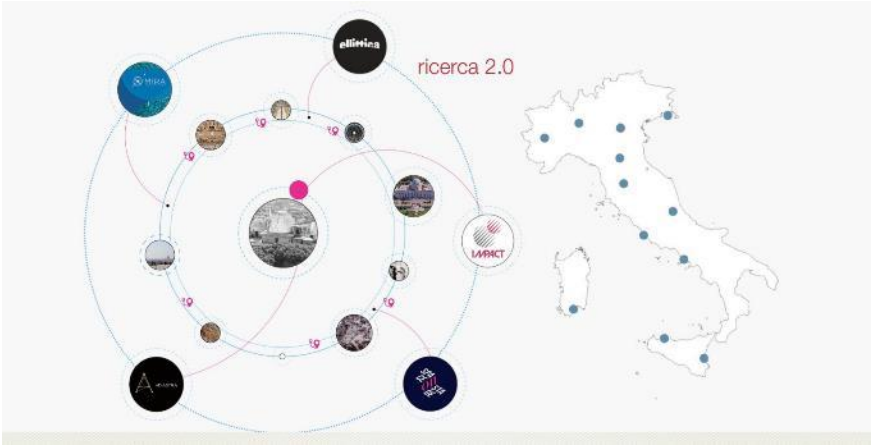

Figure 4. Distribution of second phase

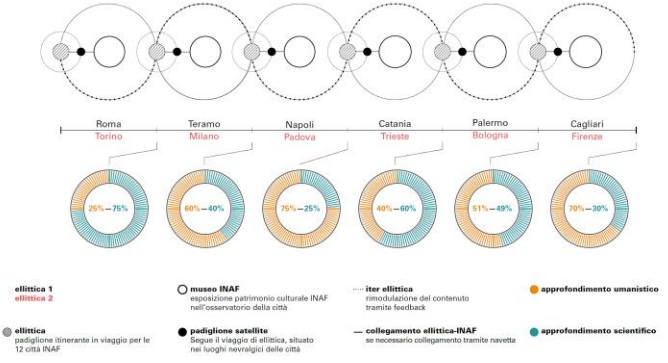
The languages chosen to interact with the publics and to engage them in cultural heritages, are chosen from different cultural areas and selected for each event according to its effectiveness.

Each module is designed on the basis of the "culture of proximity": the public will be part of the project, interacting in different ways and becoming the content developer.

The method, used for the evolution and modulation of the adaptive model, is the direct feedback (figure 5.), a process whereby the result of an action of the system is reflected on the system itself to modify and correct its behavior. The citizen is no longer exclusively a user, but his contribution, through active participation, modifies and sets directions of the design changes.



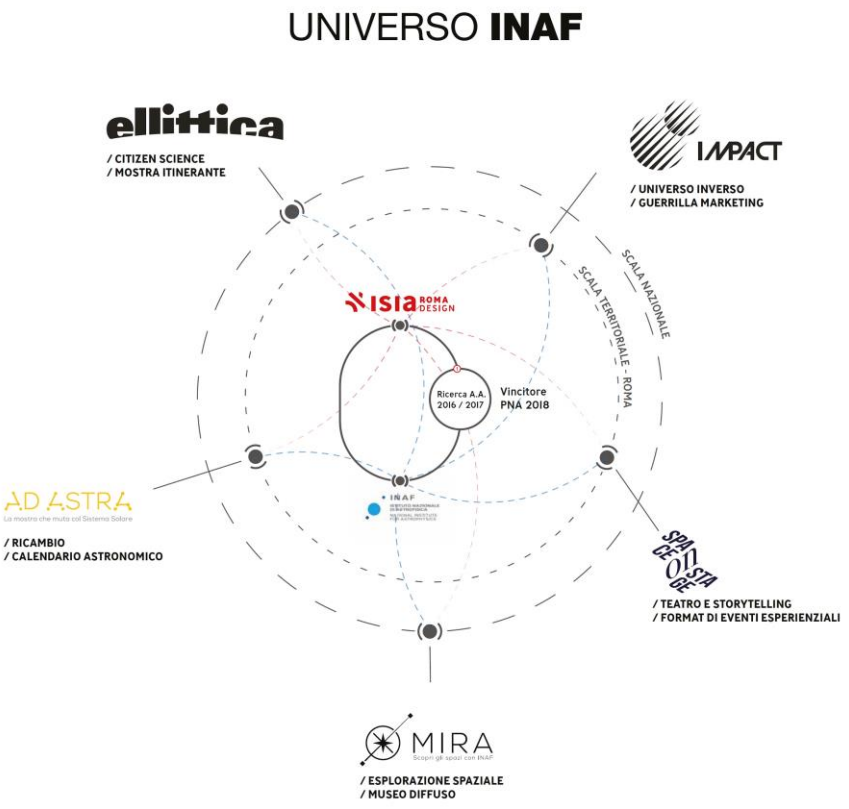


figure 5. Direct feedback from an interactive exhibit

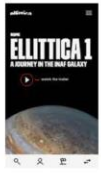
5. Results

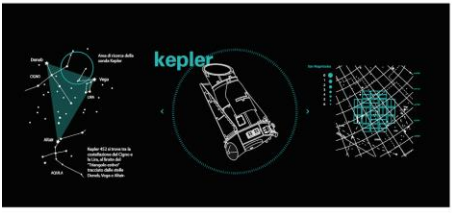


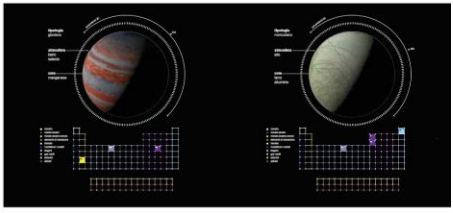
After two years of research the working groups come with several solutions to answer INAF needs. Each solution was designed following the general concepts and the guidelines of the research. Moreover, the projects/events proposed have been designed to be realistically managed and economically balanced with the possibilities of a research institutes.

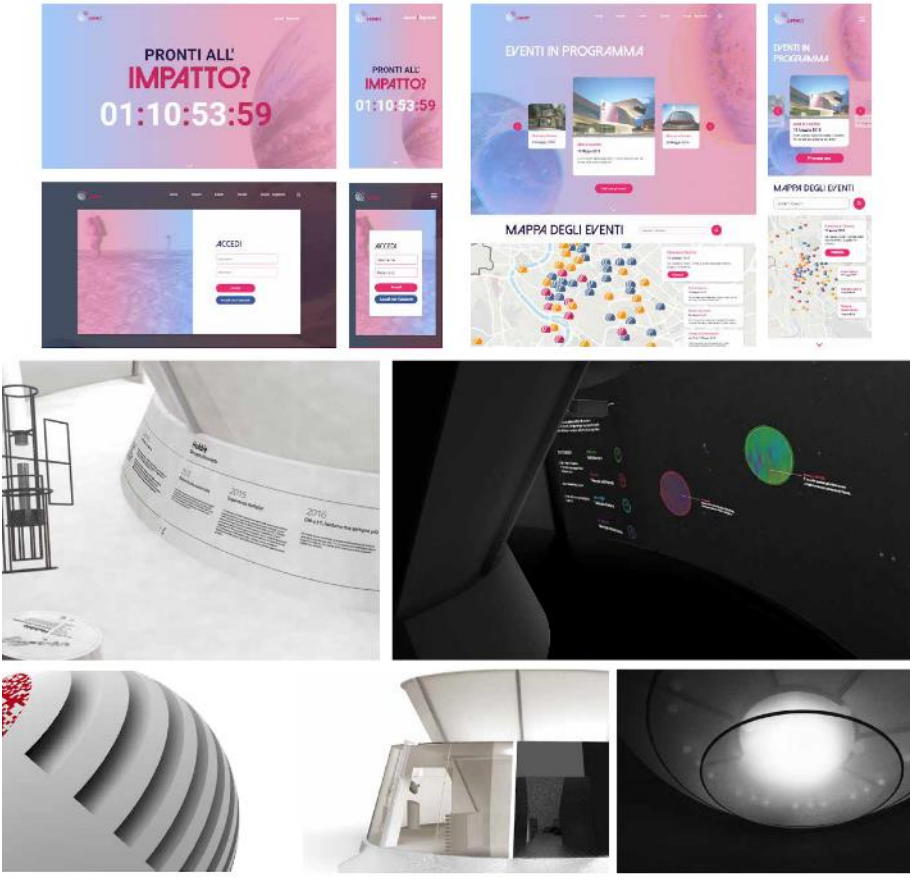
Each part of the proposed activities was not in competition with the others, but they all can be part of a set of activities developed on the Italian territory.

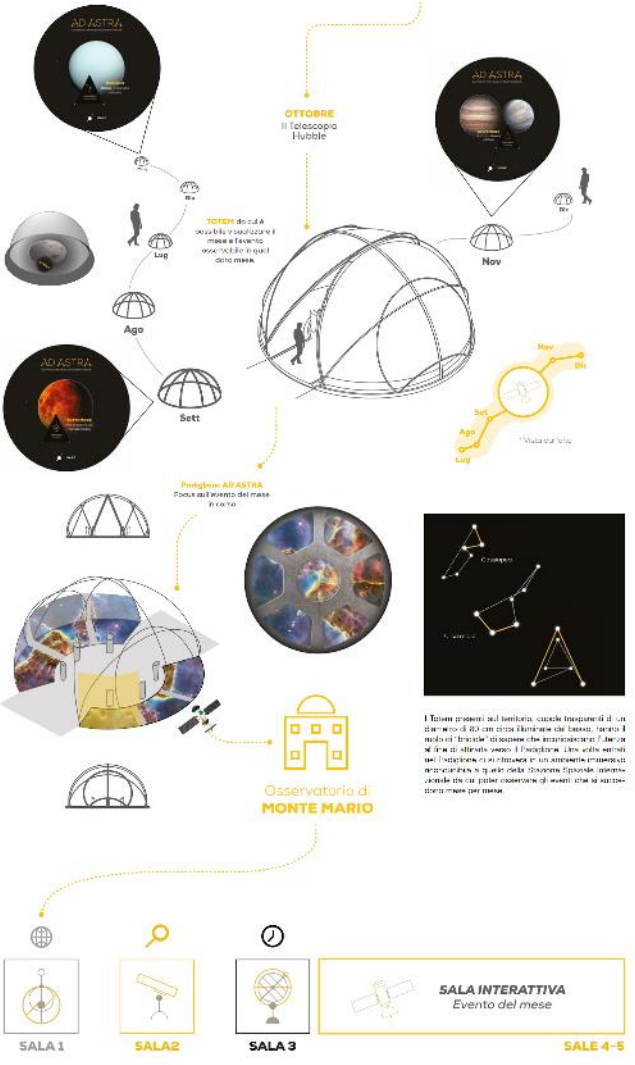
5.1 The projects in details

ELLITTICA is designed as a nomadic exhibition that will move for two years through the 12 cities hosting the National Institute of Astrophysics departments, following two parallel branches. An organic exhibition, constantly evolving according to the peculiarities of the cities in which it settles. The decisions made at each stage are irreversible and make the two exhibitions unique.

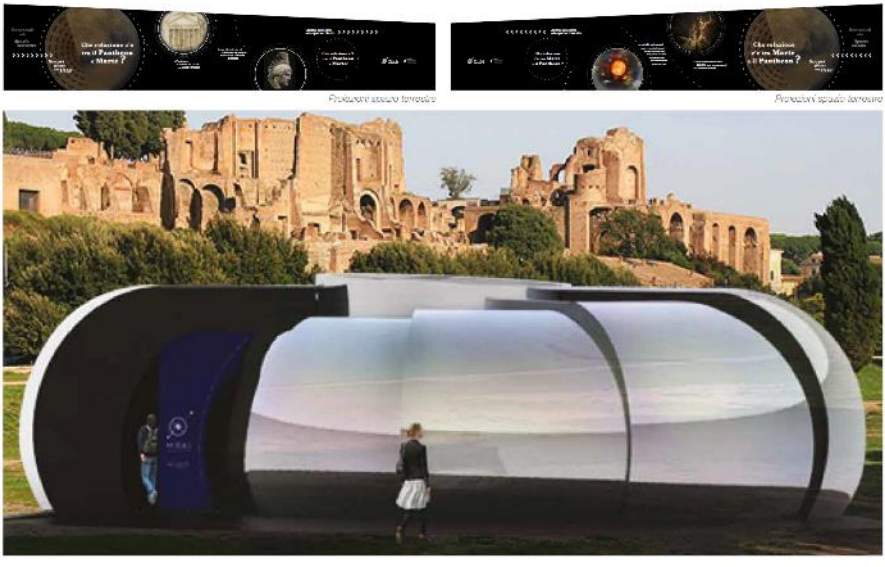




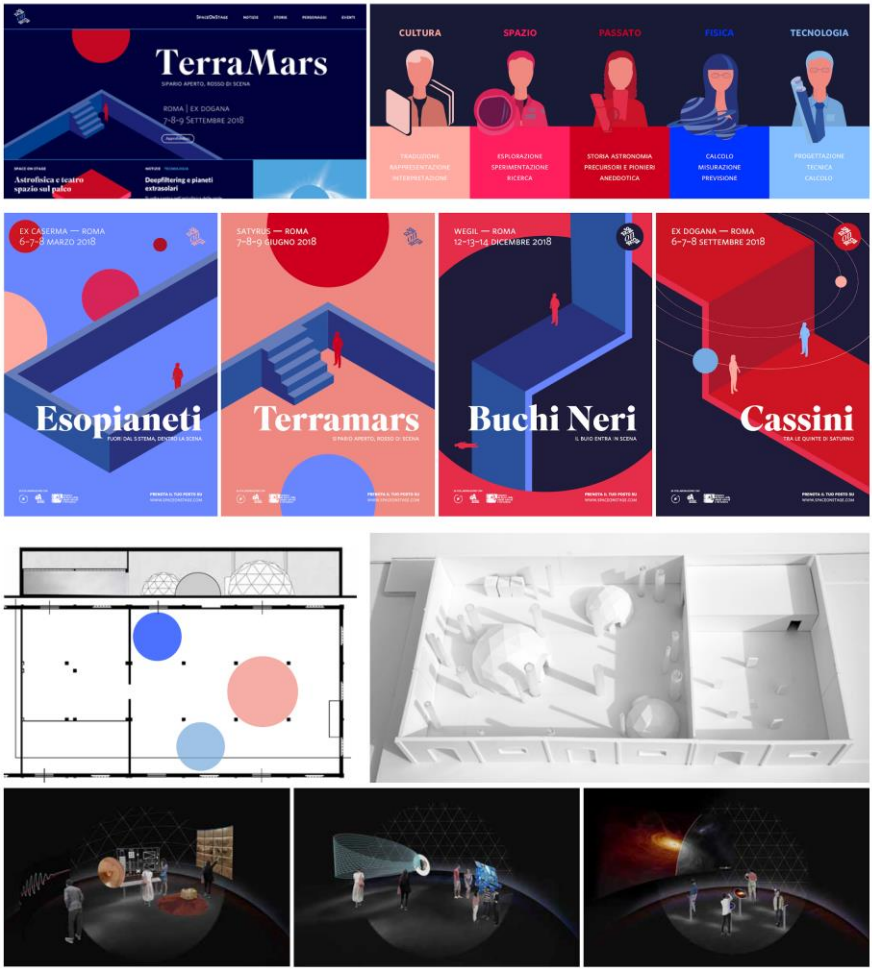




IMPACT wants to subvert the traditional visual imagery associated with space, proposing it all in the negative, where everything that is black becomes white, giving life to an opposite imaginary made of brightness and colors that stand out from the eye and attract attention.



AD ASTRA A concept was developed in the Ad Astra monthly astronomical calendar, which associates the astronomical event (example "Swarm of Perseids ", August) of the month to the appropriate instrument with which to observe / experience it (" Swarm of Perseids ": Telescope). This systemic logic determines a cadence always different in terms of experience and consultation, both of the contents and of the astrophysical instruments, from outside to inside the museum.



MIRA is a network capable of bringing together the Observatories, the Museums, the events and the sites where the history of modern astrophysics was made into a Diffuse Museum for the city. The user is involved and immersed in the discovery of the network through space exploration, walking through the city and at the same time discovering the phenomena of astrophysics.

Advertising urbano

Space On Stage is a format of events and a new method of use museum that divulges scientific topics in a simple tone of voice and engaging and stimulates curiosity e practical understanding of the profession e of tools through experience serial culture, founded on the link with the spectator and empathic involvement of it, dealing with storytelling techniques e with the involvement of actual actors.

6. Conclusions

In conclusion, the research achieved several successes.

First of all, they answer to the fluid definition of cultural heritage itself. The activities, public events, exhibits proposed allow the public to be visitors and producers at the same time. The audience can be part of several experiences and interact with the projects and the other visitors both in the real and digital world. The experiences will promote the knowledge of astronomical cultural heritage and the diffusion of INAF messages to the public.They allow people to be in touch with the research institutes and be part of the modern research activities with dedicated citizen science projects.

Some projects have already been proposed to public call for cultural heritage funding and they are waiting to be evaluated.

Furthermore, the results of the research have been awarded with the PNA 2018 and the ADI design award “Eccellenze del design del Lazio”, while they have been selected for the “ADI INDEX 2019” and on the go for the evaluation of “ADI Compasso d’oro 2020” award.

Abstract | As Design is gaining traction globally different observation models were developed to map the Design landscape. However, the application of these models in contexts with a slower maturation of Design culture and no institutional Design infrastructure can be difficult. With this challenge in mind, this paper presents a new distributed approach to support Design observation. It applies it to a case within the DesignOBS project - a project aiming to identify, map and interpret the Portuguese design landscape - and develops an online platform with the aim to create more efficient and engaging representations of Design practices and realities/contexts to multiple publics, including policymakers. The approach can benefit countries in a similar situation as Portugal, leveraging the participation of design actor-networks, encourage local initiatives, map the evolving Design landscape in collective manner, and hopefully constitute the supporting, resilient backbone to develop national Design policy.

KEYWORDS | DESIGN OBSERVATION, DESIGN ECOSYSTEM MODEL, REFLECTION-ACTION PROCESS, PARTICIPATORY PROCESSES, DESIGN SCHOOL NETWORKS

1. Introduction

Research studies undertaken by the UK Design Council (2018) as well as the Danish Design Center (2018) – two leading Design Centers in Europe –, demonstrate the potential socio-economic impact of Design, especially within the scope of innovation. Additionally, statistical evidence shows that Design plays a significantly important role in national innovation and productivity than previously recognized (NESTA, 2009). Design policies have been developed and are increasing in numbers worldwide as a result of the efforts undertaken to develop quantitative and qualitative measures for Design impact - ex. Design4Innovation (Whicher et al., 2018); Barcelona Design System (Calvera & Monguet, 2008); Design Scoreboard (Moultrie & Livesey, 2010; Moultrie et al., 2009). However, "we still need to be better at communicating who we are, and what we do" (Melander, 2019). Moreover, comparative analysis of different national Design contexts based on the application of existing ecosystem models may be ineffective since resources and conditions cannot be transferred (Raulik-Murphy, Cawood, Larsen, & Lewis, 2008).

When compared to other leading EU members, Design is rather misunderstood and thus underused in Portugal. According to the most recent Innobarometer results (European Commission, 2016), only 13% of Portuguese enterprises mention to use Design as a strategy in the business, whereas 49% of them mentioned that they do not use Design systematically (i.e. "uses Design as a central element in the company": Denmark 21%, Germany 18%, UK 17%). The lack of an effective systematic representation of Design impact has resulted in the loss of investment in the discipline within Portuguese society (Quintela, 2019). Moreover, the rapid evolving nature of Design and its diffusion in multiple areas of practice and knowledge, has also added to the confusion of what the discipline is about. With the disappearance of the Portuguese Design Center (CPD) in 2013, there are no National Design Institutions – with the exception of Design schools – that are representative of the myriad of actors within the national Design Ecosystem. As such, a more integrated and resilient observation approach of the discipline is required.

The Design schools scattered around the country seem to currently be the sole institutional infrastructure, with national presence, that still remains active and relatively independent of governmental changes and external funding (ex. European incentives). Considering the current scant resources and the status quo of Design in Portuguese society, the project DesignOBS (Towards a Design observatory in Portugal) is being established by four national institutional entities scattered around the country, to collect, analyze, interpret and represent the Portuguese Design ecosystem. It partially emerged from the results obtained through the first REDE#01 meeting (Acronym for Reunião de Escolas de Design or Design Schools Meeting) with 37 Design schools (Borges et al., 2018). Whereas REDE focuses on Design education and research, DesignOBS emerged to interpret and represent the national Design Ecosystem, including its multiple agents and evolving forms of Design practices and realities.

This study develops a new reflexive and distributed observation approach. First, it analyzes and compares European Design models currently used, and enriches the analysis with in-loco visits to key Design centers and interviews with their leaders. The lessons learned from the research are paramount to develop the reflexive approach for Design observation, enabling more participatory processes. It applies the new approach in a case with design doctorates and refines it according to the feedback from the design community. The distributed approach supports design actors – experts within their own context, namely the teaching/research staff of high education Design Schools around the country – to take initiatives and collectively shape the evolving representation of the Design landscape.

2. Literature review

2.1. Characterization of the Portuguese Design context

National Design institutions such as Design associations, forums and Design centers are either non-existent or lack a more valid representation of the agents involved in the Design ecosystem. The long-standing antecedents of design training started in 1934 with the Decorative School of Arts of António Arroio, teaching Applied Arts (CPD, 2000; Manaças, 2005; Almeida, 2009). The institutionalization of Design Education in the country began after the democratic revolution (post 1974), with the first design courses created in the Schools of Fine Arts of Lisbon and Porto. In 86, ICEP (Institute of Portuguese External Commerce) would launch the "young designer" contest that aimed to improve the relationship between Design education and the reality of industries (Castanheta, 2012). Additionally, in the 80's, the Portuguese Design Center was created and aimed to promote Design and designers at the national level and launched multiple programs such as "Designers for industry", supporting the infusion of young professionals in companies. However, the latest evaluation reports revealed that "there is still a profound ignorance in Portuguese companies regarding the discipline and its advantages" (Curado, 2013). Moreover, the lack of financial autonomy of the institution, several years of accumulated negative results – namely the poor connections established with SMEs – and a climate of austerity, sufficed to close the center (Curado, 2013; Quintela, 2019). In this context, when compared to leading European countries (ex. UK, Denmark), Design culture in Portugal still has room for improvement.

Additionally, there are still important weaknesses in the integration of Design in the Portuguese economy, particularly in the national industrial fabric, and the internal processes of maturing the strategic importance of the discipline are slow. The Innovation Strategy Portugal 2018-2030 proposed by the government emphasizes the infusion of innovation at multiple levels but does not mention "Design" once (Conselho de Ministros, 2018). Another governmental document also mentions the implementation of Design strategies for the "modernization and upgrade of industry, economy and the country" (PNR, 2019). However, no specific policies were developed. In recent interviews with Design practitioners, Quintela

(2019) mentions that “the adoption of public policy for the promotion of Design as an instrument for innovation in industry and exportation of national production, seem to be mainly driven by a set of external political and financial stimuli as opposed to internal processes of maturing the strategic importance of the discipline” (Quintela, 2019; translation from the authors).

2.2. International Design models

Countries worldwide have invested in the promotion of Design with the aim to promote the country internationally, raise awareness among local consumers about the value of Design and quality of products, and increase interests from local industry about the benefits Design can bring to business performance (Raulik-Murphy et al., 2008). These programs have evolved significantly in scope and complexity (ex. Design 2005! Saarela, 2000; Better by Design, New Zealand Design Taskforce, 2003 mentioned in Raulik-Murphy et al., 2008). Meanwhile, Design has entered the European policy agenda (European Commission, 2013) and is already part of national innovation policies across Europe (Whicher, Cawood, & Walters, 2012). This in turn, gave impetus to the creation of several EU projects to accelerate the integration of Design into government and business strategies ex. SEE platform (sharing European experience in Design innovation policy), IDeAll (integrating Design for all in living labs), €Design (measuring Design value), DeEP (Design in European policies), EHDM (European house of Design management) and REDI (regions supporting entrepreneurs and Designers to innovate) (Whicher, 2016); and more recently, initiatives such as Design For Europe (2017), have created principles and guidelines to support countries, cities and regions to take more advantage of design-led innovation.

In this context, a growing interest in the development of Design models and metrics has also emerged to better compare performances between countries, at the international level (ex. Design scoreboard, Moultrie et al, 2008; Moultrie and Livesey, 2009) and map real-world situations, to understand the interactions between the multiple actors involved in the Design system. For example, Calvera and Monguet (Calvera & Monguet, 2006, 2008) developed the Barcelona Design System model, which partially departed from the Milan Design System model (Bertola et al., 1999). Design system can be defined as a theoretical model used to “visualize in only one map the different agents and actors that, within a land well delimited both economically and geographically, act, interact and establish relationships between them related to the professional practice of Design and so, have an economic impact” (Calvera and Monguet, 2008). They outline it according to three main axes, namely (1) offer, (2) demand and (3) culture (Calvera and Monguet, 2006, pp.19). More recently, Whicher has developed the European Design system (Whicher, 2016, 2017; Whicher et al., 2012) complementing previous models that integrated system failure theory (ex. Love, 2007; Raulik-Murphy and Cadwood, 2009 in Whicher et al., 2012). System Failure theory highlights the role of government intervention to stimulate supply and demand via actions, policies or programs, and tackle failures in the way actors of the system interact (Love, 2007). Whicher identifies Design’s role in the context of innovation according to three axes with nine

components: (1) supply (research, education and Designers), (2) demand (users, support, promotion); and a third - different from the Barcelona's model – called (3) "supply-demand" (funding, policy and actors). The two first axes are similar between the models, however the third reveals a fundamental difference: whereas Milan and Barcelona's models emphasize the role of Design community to promote Design culture (i.e. practitioners and people working within Design culture promotion and production); Whicher's model highlights the role of the government, in particular, policymakers, as an overall influencer/corrector of the Design system. As such, we may observe a two-way approach with complementary views. Milan and Barcelona's models seem to adopt a more bottom-up approach to map and regulate Design systems. On the other hand, Whicher has a more top-down and institutional approach, integrating the role of other actors beyond Design systems (i.e. policymakers) to regulate systems demand and supply.

2.3. Research gap

Existing Design observation models are key to better observe and understand the importance of Design within innovation. However, these models present some limitations, especially in contexts characterized by a slower maturation of Design culture, and with no institutional infrastructure to promote the discipline.

Bertola et al. (1999) and Calvera and Monguet (2008) perspectives of Design observation are highly context dependent. They highlight local Design resources as key vectors for the construction of a Design identity and image. This perspective is effective within well delimited Design systems with a rich Design culture but may not work as well within more complex and different contexts. On the other hand, Whicher's Design model has already been applied in multiple European countries to better inform policy and thus provides means for international comparison of Design performance within the context of innovation. However, the application of Whicher's model may not be very successful in countries with limited availability of data for the indicators developed, such as the case of Portugal. Second, by adopting an inherent focus on policy making and policy makers, the indicators developed may not capture the entire spectrum of Design practices and realities, thus resulting in partial views of the Design ecosystem. Finally, the development of policies requires valid/reliable input to guide the creation of actions and programs. The inherent mechanisms to collect robust Design information are a challenge whenever there are no public institutions. This is one of the key tasks of the DesignObs project.

Bringing existing Design ecosystem models to observation practice in challenging contexts may require more embedded, networked "open" systems (Hobday, Boddington, & Grantham, 2012). Hence, we propose a new approach to support the Design observation process, while attempting to align our model with existing ones for the purpose of comparison. We build on the analysis of existing models, interviews with leaders of Design centers, and in-loco visits to international Design observatories to develop a distributed and

reflexive observation approach which could facilitate a richer representation of Design and – ideally – the creation of a more resilient national Design infrastructure.

3. Methodology

Based on the existing Design models and taking into consideration their limitations, the project DesignOBS was created to identify, analyze, characterize and represent the agents involved in the Design ecosystem in Portugal. The project emerged partially from a previous initiative called REDE, organized by 37 national Design schools and their representatives, in 2017 (Borges et al., 2018). During the meeting – mainly focused on Design education and research – numerous topics emerged which lacked important supportive national data about Design. To operationalize the DesignOBS project, an iterative process was put in place while taking into account the Portuguese context, characterized by a scattered and unarticulated Design community, a less mature Design culture and lack of national institutional infrastructures. We followed a three-step Design research process:

1. Development of a preliminary observation process based in particular on (i) the analysis and comparison of Design ecosystem models in use at the European level to better understand their advantages, limitations and complementarities; (ii) the interview and in-loco visits with leaders of key international Design centers i.e. Danish Design Center (DDC), Christina Melander, and Tokyo Design Center - to understand the data collection mechanisms put in place and main challenges faced by existing observatories; and (iii) the concept of reflection-action process proposed by Schön (1983).

2. Application of the approach on a preliminary (and manageable) case about design doctorates to create a “first portray” of the status quo of national scholarly Design research. The analysis of results led to the development of guidelines for keywords and calls for action which were presented and discussed within the REDE community (Costa et al., 2020).

3. Refinement of the iterative reflexive and distributed observation approach based on the results obtained in stage 1 and 2. The refinement of the approach reinforces the iterative reflection-action processes with and through the design community, leveraging additional interpretations of design-driven data.

Based on the literature review, we identified two main approaches in current models: whereas Whicher’s ultimate beneficiaries are intended to be policymakers to create actions and programs which could better benefit Design activity; Milan and Barcelona models seems less focused on guiding governmental action, but more on emphasizing Design as part of interweaving actions amongst business and culture, technology and craftsmanship, individual entrepreneurial initiative and teamwork undertaken by actors in (or in relationship with) Design systems (Calvera and Monguet, 2008; Bertola et al., 1999). These

two approaches take place in different levels of complexity and context (i.e. European arena versus a city), thus explaining their fundamental differences in their representation potential. The challenge thus lies in navigating both at the macro and micro levels of representation, while capturing the richness of Design in between those levels.

Additionally, the visits to Design centers (i.e. DDC and Tokyo Design center) and interviews with key leaders reveal important challenges that countries with a more mature Design culture still face. Key takeaways from the interview with Christina Melander included (1) the importance of lobbying about of Design to the government whenever there is no formal institution; (2) being able to capture the best cases of Design intervention within the public and private sectors, (3) a more compelling narrative construction about Design, so that it can reach publics beyond Designers; (4) coupling quantitative information taking into account the new ICT and social media services with those narratives whenever possible; (5) developing a national Design identity. Although quantitative studies about Design already show its inherent impact on the business bottom line (Danish Design Center, 2018; Sheppard, Kouyoumjian, Sarrazin, & Dore, 2018), it seems that "surveys are not very useful to make a connection between Design and economic values" and that "Design(ers) still struggles to articular how it(they) create value" (Melander, 2019).

Since the initial challenge of the project was to create a national Design ecosystem map, we looked at the multiple components of Whicher's model (2016) in the preliminary phase. Considering also the familiarity of the team members with Design education, the first topic studied was focused on "Design research", one of the key vectors of Whicher's model. To analyze "the number of Design doctorates and type of Design research undertaken in Portugal", data from three different governmental databases was collected, analyzed both quantitatively and qualitatively. Results showed very important disparities in the number of Design thesis concluded, and dubious quality of information (i.e. some thesis are classified within "Design course" but are not about Design). The lack of curation and reliability of information collected through the sole institutional means available, thus jeopardizes the reliability of a map built through those means. The results of this study – which are explained in detail elsewhere (Costa et al., 2020) - were presented in the second REDE meeting with 55 representatives of 23 design schools in late October 2019. The event was key to develop the first calls for action in the scholar community; build awareness and discuss the flawed mechanisms put in place to collect, interpret and communicate information about Design.

4. Crafting a reflexive and distributed approach for Design observation

Considering Design as a reflexive, embodied and continuous process of discovery and actualization involves some skeptical orientation towards what appears to be an unproblematic "first portray" (i.e. example of Design doctorates in Portugal). Schön (1983;

1992) in particular uses the term “reflective practice” to emphasize the relation and interactions between action and reflection: an actor sees, acts and then sees again to understand the consequences of their actions. Design hence, puts emphasis on this iterative actor-driven process of understanding a situation through an attempt to change it, and then changing the situation through an attempt to better understand it. Moreover, it also looks at actors and their role in the design process as key to produce and reflect upon Design materials and forms (i.e. representations). Adopting this view as a lens and looking at the DesignOBS as a material artifact resulting from this iterative reflective practice is key to build a more comprehensive understanding of Portuguese Design.

Based on the previous stages of the research process and Schön reflective-practice theory, we propose a new approach to represent and interpret Portuguese Design ecosystem. Moreover, we also detail how DesignOBS observation model and representation will according to this iterative process.

4.1. Reflection-Action process

We combine two complementary approaches identified in literature (top-down and bottom-up) to build an iterative and continuous process to support reflexivity and action (Schön, 1983) while evolving representations of the discipline at the national level (Figure 1):

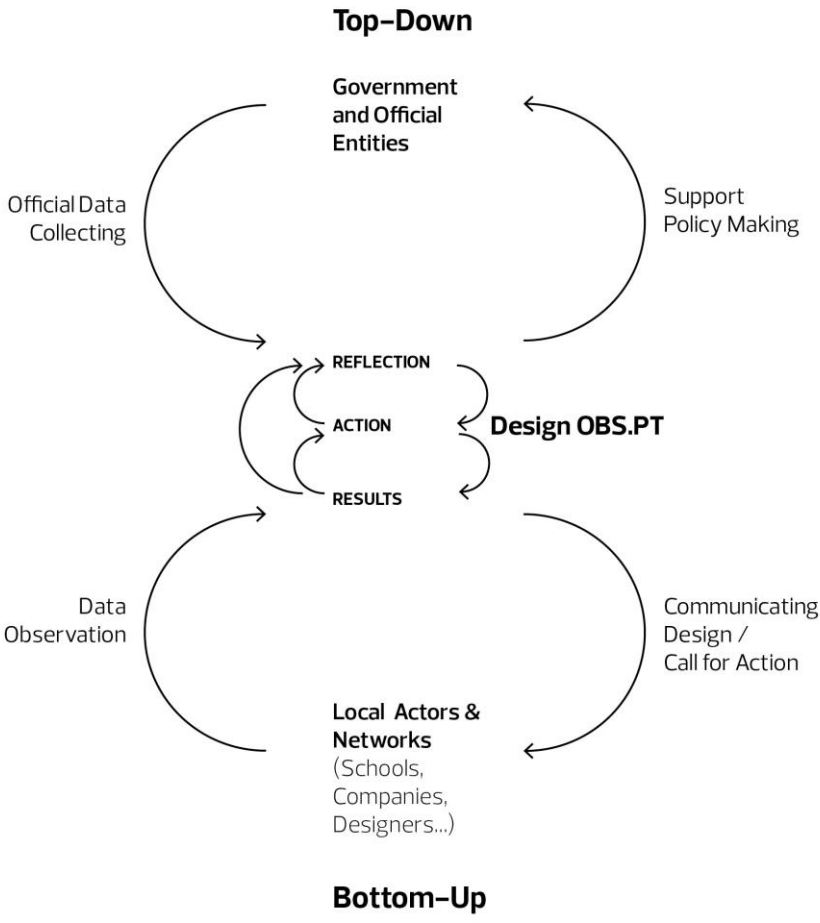

Figure 1. Observation process within DesignOBS, based on Schön (1983)

First, we verified that Design information is scattered, and institutional databases are not very reliable as they do not focus solely on Design; and are missing an important interpretative component. Some inferences ("first portray") can however (i) be built based on available data, (ii) be used to raise awareness inside the community and, in turn, (iii) leverage more coordinated initiatives/actions (Figure 1).

Second, we use distributed mechanisms and school-driven networks to collect information; and an open toolkit to support local observation. The current network of informants i.e. REDE, Design schools - are considered as experts in their own contexts and approaches, with connections with local businesses, organizations, labs amongst other actors in local Design systems. Moreover, they are currently the sole institutional and robust infrastructure at the national level. Identifying local networks is paramount for the project to expand, in a sustainable way, thus adding more intricate and detailed layers of representation. Having Design schools as champions of local Design systems provides traceable material, increases ownership of the data collected, and responsibility of the representation of the region, stimulates grassroot governance and self-organization.

4.2. DesignOBS as an evolving artefact of representation

DesignOBS (www.designobs.pt) can be interpreted as a cumulative, critical and evolving platform which aims to both (1) connect and facilitate dialogue amongst Design stakeholders, giving them visibility within the Design ecosystem; and (2) create more efficient and engaging representations of Design practices and realities/contexts, in three main topics: Design education and research, practice and culture. These topics as well as their content were created based on Whicher's Design ecosystem model. They are used as guidelines to support the research but can evolve according to the feedback of the network and need for further developments.

The DesignOBS platform aims to be the direct visible result of the application of the iterative reflection-action process (Figure 1). Considering the lessons learned from previous observatories, the models used at the European level, and the national context, we propose to collect data via an open toolkit for Design observation distributed amongst an established Design school-network (REDE). The data collected has two main levels of input as shown in Figure 2.

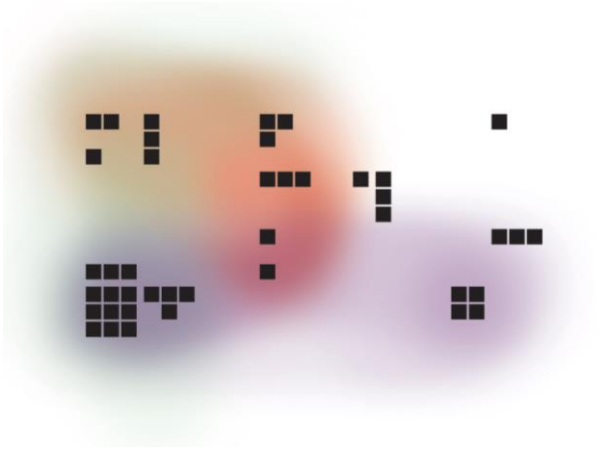

Figure 2. Objective (black) and interpretative (colour) layers of a Design Ecosystem Grid, Observatory's model.

BLACK INFORMATION, THE OBJECTIVE LAYER: The first level focuses on collecting, extracting or producing quantitative and objective information (black dots in Figure 2), which will enable a rapid creation of maps representing the diverse Design realities across the territory. It makes use of more desk research, surveys; closed questionnaires as well as direct and participatory input from the schools, to collect information. For instance, the study about Design doctorates undertaken in Portugal (Costa et al., 2020) fits within this level. First, the aggregation and analysis of results from governmental databases enabled the elaboration of a "first draft". Verifying disparities, the team searched for additional PhDs within other databases (universities which provide Design doctorate level studies) to complement and build up a more reliable map of Design doctorates. Another approach used was to ask directly to the school-network to "feed" the platform with the information available within their own institutions. Thus, they become active creators of the content on the platform. This process is being used to approach other research topics such as "characterization of Design companies in Portugal". Databases such as SABI or AMADEUS can provide some information to facilitate the creation of preliminary representations, develop interpretations, calls for actions in the community/network; and advance other topics which require more in-depth, local and interpretative observation (Figure 1). Moreover, the objective data (i.e. archives, databases) is open to the community to build on, and make additional interpretations, producing new Design discourses (colored discourses in Figure 2).

COLOURED INFORMATION, THE INTERPRETATIVE LAYER: The second level of data collection builds on the first layer of information to inspire more interpretative, qualitative, and subjective discourses about Portuguese Design Ecosystem. It is also more complex, context-dependent and prone to emergence as it embraces the inherent characteristics and identity of the regions which constitute the territory. Thus, it makes also a more systematic use of

the school-network and participatory processes to evolve the observational toolkit and collectively shape Design ecosystems. For example, the "characterization of the Portuguese Design companies" can have both a quantitative denotation (ex. how many companies exist; percentage of exports, etc.); qualitative connotation (ex. how do these companies perceive Design and designers) as well as interpretative connotations (ex. design identity of a region). This level thus, is more subjective, embedded and more prone to emergence.

This data collection process and the organization of the different elements to be observed, already constitute a landscape per se (black layer of information), like the periodic table of elements, arranged according to their properties. Instead of metals or non-metals, gases or halogens, we aim to have schools, promoters, designers, museums, companies, government agencies, amongst other elements. This structure is aligned with existing design models for the purpose of comparison, but will evolve through time, and according to the emergence of other themes and topics, adding other emergent discourses about Portuguese Design (colored layer of information).

5. Conclusions and future steps

As Design is gaining traction globally different observation models are being developed to map the Design landscape and better inform policies. However, the application of these models in contexts with a slower maturation of Design culture and no institutional Design infrastructure can be difficult. With this challenge in mind, this paper presents a new distributed approach to support Design observation. It applies it to a case within the DesignOBS project and develops an online platform with the aim to connect Portuguese Design stakeholders and create more efficient and engaging representations of Design practices and realities/contexts to multiple publics, including policymakers. The approach can benefit countries in a similar situation as Portugal, leveraging the participation of actors-networks, encourage local initiatives, map the evolving Design landscape in collective manner, and hopefully constitute the supporting backbone for developing Design policies in Portugal.

This research also presents some limitations which in turn indicate directions for future research. First, the application of the approach is restricted to the case of Design doctorates within the first level of data collection (quantitative analysis). The application thus needs to expand to other levels and topics of research to reach publics beyond Design(ers).

Second, due to space limitations, the development of the observation toolkit mentioned in Figure 1 is a topic that goes beyond this paper. The focus of this study is to define and explain the objective(s) of DesignOBS and develop its observational approach. Future research should, however, make a thorough analysis on the multiple tools and methods to be used to collect the data, while taking into consideration the objectives of the project.

Third, the expansion of the project to other socio-economic and cultural actors and institutions within Design ecosystems is paramount to gain structure and resilience. Given the short time frame and limited funding of DesignOBS project, the involvement of companies and other institutional entities, beyond Design schools is required. Thus, future steps include infrastructuring activities, to build up a network of networks scattered around the territory, enabling further connections amongst actors. Future studies should however, take into account the failures of past initiatives, centers and Design associations.

This study constitutes an important step to advance Portuguese Design observation. It develops a new approach which integrates the top-down and bottom-up perspectives based on previous Design ecosystem models. It also puts forward a more embedded and participatory approach for Design observation and interpretation. Moreover, it may also contribute to Design practice, by proposing new mechanisms of observation for countries with a less mature Design culture and more fragile Design infrastructure.

About the Authors:

Nina Costa Researcher based in Aveiro University, integrated member of ID+ research institute. She is currently the main assistant of the DesignOBS.pt project. Her PhD aimed to integrate PSS and service design approaches. Main interests are focused on service design, network analysis and mixed methods in design research.

Vasco Branco Full professor in Design at the Communication and Art Department of the University of Aveiro. Director of ID+ (Research Institute for Design, Media and Culture). Member of international advisory boards (The Design Journal [UK], I+DISEÑO [Spain], Cadernos de Estudos Avançados em Design [Brasil])

Rui Costa Designer, professor (communication and art department) and researcher (ID+). His PhD in Design is entitled Communication Design as Knowledge. His areas of interest are research through project and information representation. He is the co-PI of the Project DesignOBS: for a design observatory in Portugal.

Afonso Borges Communication and industrial designer. Professor at the University of Beira Interior; invited Professor at the University of Porto, and member of ID+ research institute. PhD in design, he is a researcher of everyday objects.

Raul Cunca Designer and associate professor at the Fine Arts Faculty of University of Lisbon. Member of several Scientific Committees, referee of the magazine i+Diseño. Developed design activities in different areas since 1986, collaborating with companies and institutions in Europe.

Ana Catarina Silva Teacher, researcher and has a PhD in Sciences and Technologies of Communication under the topic of design of the technical book in a hybrid editorial context. Her main research topics are editorial design, typography and design education.

António Modesto studied art and design at Faculty of Fine Arts of Porto University, where he is an Associate Professor. Beyond the academic activity, he researches and works in design and art. He has been an art director in his own design studio for more than 15 years.

When a designer encounters an artisan: a parameter analysis investigation

Carla Paoliello[a]

[a] Centro de Investigação e de Estudos em Belas-Artes, Faculdade de Belas-Artes, Universidade de Lisboa
*carlapaoliello@gmail.com

Abstract This research looks at the issues related to the design and its local dimension. It investigates potential parameters as tools of social, cultural, economic, and environmental impact through the analysis of Brazilian and Portuguese partnerships. We delimited (described and analyzed) different relations to understand these experiences. A theoretical framework was produced. It comprised the description and evaluation of twenty-five case studies. This stage goes beyond its theoretical limits. It verifies in practice the proposed evaluative parameters. We conducted interviews from a semi-structured questionnaire that reached the artificer, the designer and the entities that foster these partnerships. The indicators used proved to be efficient in assessing the social, cultural, economic, and territorial dimensions. The final considerations state that impact is a two-way street. Openness is important to exchange among the various types of knowledge. Complementarity practices (scientific and non-scientific) foster dialogue to signify the world. To make it better.

KEYWORDS | DESIGN, CRAFT, PARTNERSHIP, IMPACT, PARAMETERS ANALYSIS

1. Introduction

This research looked at issues related to the local design. It aimed to investigate design as a tool of social, economic, and environmental development. It produced a synthesis description of Brazilian and Portuguese partnerships. It delimited (described and analyzed) the relations existing in this process. It also identified the elements of "disengagement" and the impact of these meetings. The study defended the role of design as a promoter of life quality not only its economic aspects. We perceived it as a factor of exchange, a driver of collaborative practices. The major interest was in the interface with local makers and the products demarcated by regional characteristics. It is an expression of a collective, or a single artisan (Sennett, 2009 and Micelli, 2011). These productions carry within themselves the particularities of a specific culture.

The first questions that guided the investigation were:

1. What is the meeting point between the design and its local dimension?
2. How does product development occur from a partnership between designer and artificer?
3. What is the impact of designing with and not for?
4. How to analyse how much this hybridization benefits both parties?

We needed the deconstruction of power and authority. We need to understand that both (the designer and the artisan) have sensitivity and conscience in their doing. That was when there was a possibility of joint action. We analysed projects involving:

- the community and their local production unit. The artisan and their social, technical, cultural, and economic context;
- the designer as a facilitator. In partnership, he unveiled the existing reality. Individuality, he presented his universe;
- the entities or institutions that fostered these partnerships and orchestrated the objectives and goals.

The co-creation methodologies recognize all subjects involved in the making. They identify the history, quality, and lifestyle of each actor. They accept the materials and techniques used and the production space. They consider the local material and immaterial heritage. Finally, they value each one involved and recognized the value of civic engagement. By that, they allowed trust and self-esteem generation.

2. Design & dimensions of local making: approximations; designers versus artisans: differences

During the research, several texts helped to understand design as an improvement tool. The focus was on the process of the idea, conception, development, and production. Especially the one carried out collaboratively with local production units or with artisans. It is worth mentioning the definition by Miguel Arruda (2013) when he said, "design lives from the meeting between the designer, the producer, the materials' manufacturer, the worker, among others".

This states the importance of teamwork. It also recognizes and respects the diversity described by Ezio Manzini (2008). These competencies are also in line with Boaventura de Sousa Santos' speech. He defends the need to discover other types of intelligence / knowledge and to respect multiculturality. Another important concept was otherness. Gui Bonsiepe presented it as a "willingness to respect other design cultures with their inherent values" (2012, p.38). It is a concept that breaks with the developed and underdeveloped dichotomy.

The projects studied had collaboration and the idea of working in common as a basis. Richard Sennett in *Juntos* dedicates a compliment to cooperation. He defines it as "a skill, that is, an ability to understand and to be receptive to the other, in a way to reach a joint end" (2012, p.9). The term symbiosis also emerged. It is a beneficial and reciprocal association of two or more different organisms. It is a system of cooperation. In some of these social relationships, there is a tendency towards a vertical path. One in which an actor establishes with his partners a hierarchy, a power of the giver over the recipient. In other cases, relationships are more horizontal and hierarchies less defined. There is dependence, but it takes on a mutual character. The result is a collective responsibility.

In these last ones, it is important to drop issues such as domination and submission, superiority and inferiority, heteronomy, colonialism. It is important to confirm the concepts of collaboration, autonomy, respect, trust, emancipation, motivation, and empowerment. The purpose of this study was to perceive, understand, and measure the impact of the other in a bilateral and interpersonal relationship (designer + artisan).

The partnership involved underwent adaptation, metamorphosis, and integration processes. It is worth noting that the other is an obstacle. It forces one to look, to understand, and to admit the differences and the similarities. By becoming aware of each ones' limit, they perceived the power that exists in the encounter. The relationships may be punctual or longer. They may be harmonious; they may become confrontations. What stands, as a result, is always another process of thinking and/or doing. Perhaps even another process of being.

It was thus believed that other parameters were necessary. They were fundamental to study the social, cultural, economic, and environmental change. To analyze the whole new structure created from design-craft development.

Therefore, another fundamental concept was the idea of local development. It explores and discoveries local potentialities. For Ávila (2000, p.69), true development could only be achieved through the education of the community itself. The artisans have to take the process reins. In this scenario, where is the designer? The artisan community is no longer passive but has an effective, active, and proactive stance. How does the designer suit in this new context? We believed that he has the role of activating the flowering. He enhances the process of retrieving the elements, stories, and traditions that result in local differentiation. But it is also important to the local community to achieve a progressive reduction of external dependence. Autonomy is required as proposed by Gabriel Patrocínio and also by Ray Lambert and Ruth Flood for the Design Council.

2.1 The place of handicraft in Brazil

The study of handicrafts in Brazil started in 1950. Lina Bo Bardi and Aloísio Magalhães reflected about the Brazilian production. Both realized that they acted in society more as articulators than as creators. They also agreed that the development would come from the meeting of culture with the technologies generated in and for the national reality (Anastassakis, 2014). The design-craft binomial was likely born with them. It is from their texts that the understanding of design's role in Brazil begins.

At the same time, the federal government has instituted national craft development programs. Noteworthy is the emergence of SEBRAE - Brazilian Micro and Small Business Support Service. Today it is a private, non-profit institution. It aims to promote competitiveness and small business development. From the '90s, SEBRAE has been carrying out local projects to foster crafts from design.

2.2 The place of handicraft in Portugal

In Portugal, there is the Statute of Craftsman and Craft Production Unit. It is a document from 2001 that gives visibility, social enhancement, and a professional dignification to craft. This and the creation of the Artisan Charter and the Artisanal Productive Unit Charter were important processes. It is a process for Portuguese know-how recognition. We also highlight CEARTE, a Center for Vocational Training for Crafts and Heritage. It develops activities of vocational training, recognition and skills validation. It fosters entrepreneurship and innovation. Their targets are individuals, micro-enterprises, and other economic actors in the cultural, creative, and heritage sectors, in particular in the field of handicrafts.

2.3 More questions

New questions then arise: How to determine the value of a partnership? How is it possible to measure the quality of life? social and cultural equity? economic growth? the environmental valorization? Evaluation is a possible response. It is a mechanism of understanding and delimitation of the project/program or service scope. It questions the transformative

potential of a given action and its impact. There are two priority questions to check the policies:

1. What do you want to measure? 2. Why do you want to measure something?

The indicator will be the element capable of informing about the reality. It is the tool or instrument with which it will be possible to perceive the change.

3. The path traveled

To understand the dimensions of the Brazilian and Portuguese co-creations, we did a compilation of projects from the SEBRAE TOP100. We also used the research by Cláudia Albino (2017). The selection of the projects that were further investigated followed the criteria:

1. They had to be a source of evidence for co-creation. There was a respectful and horizontal combination of technical-scientific design knowledge and the skills of craft knowledge. (Santos, 2002)

2. They were emancipating partnerships (Freire, 1988 and Rancière, 2002). We prioritize the search for local identities (Cunca, 2019), otherness (Bonsiepe, 2012), openness to meet and exchange (Eco, 1991), respect for cultural pluralism (Appadurai, 1996). We also considered the beliefs, *Operandi modes*, and histories of the structured relationships (Bourdieu, 1989).

After discussing the Brazilian and Portuguese production, we made a list of the project's objectives. We reclassified these data into four dimensions - social, cultural, economic, and environmental. The result was an overview proposed as goals to design-craft partnerships. We also did a list of forty-six indicators that, summing up, aimed at:

_the quality of life and culture of the stakeholders;

_increasing added value to the product or service provided; and

_the potentiation of a more intense experience of the territory.

The result was the pre-elaboration of the form adopted in the interviews (Table 1). Through it, we tried to give voice to the research subjects. We understood their ways of seeing the world and reflecting on the impact and their practice. We exposed each side; spoke out the characteristics that focus on locality. It was an exercise of mediation the exchange and the interstices between professionals.

Finally, the sample investigated consisted of 20 Brazilian and 5 Portuguese projects. It is worth mentioning that both Brazil and Portugal are countries with complex geographies. Both have diverse cultural landscapes. The north is not the same as the south; the coast also differs from the interior. We gave sight to the material and immaterial heritage, to the intangible knowledge that rose when plurality encounters.

Table 1. The form used during the investigation

1. What was the reason to do a partnership with the designer (or the artisan)?
2. Was there an impact in your way of creating objects? ☐ yes ☐ no.
If there was, please answer the following questions.

		0 – no	1 – a little	2 – moderate	3 – quite enough	4 – don't know how to answer
3.	Was it a collaborative process?					
4.	Was there an improvement in the process?					
5.	Was there an improvement in the product?					
6.	Was there a development of a new collection?					
7.	Was there an improvement in the material used?					
8.	Was a local material valued?					
9.	Was there less waste?					
10.	Was there an improvement in a technic?					
11.	Was there an improvement in production?					
12.	Was there an improvement in the production place?					
13.	Was there an improvement in the product's price or delivery terms?					
14.	Was there a formation on fair trade?					
15.	Was there a transformation of your business skills?					
16.	Was there a business improvement in its disclosure?					
17.	Did you go to an event to present the partnership?					
18.	Was there a cultural exchange?					
19.	Was there recognition of your know-how?					
20.	Was there recognition of the local identity?					
21.	Did the "new collection" reflect the territory?					
22.	Did it contribute to the improvement of economic benefits?					
23.	Was there an improvement in living conditions?					

24. From this experience, you have become more: (you can choose more than one characteristic)

☐ accepted
☐ aware of your know-how
☐ accomplished
☐ curious
☐ motivated
☐ active
☐ critical
☐ innovative
☐ empathetic
☐ flexible
☐ strict
☐ focused on delivering quality services
☐ able to evaluate your production
☐ able to work in groups
☐ confident
☐ responsible
☐ autonomous
☐ open
☐ tolerant
☐ creative
☐ sensitive to environmental issues
☐ ethical
☐ satisfied with the partnership
☐ happy

25. Is there another contribution that the partnership has made to your profession?

4. Case studies and their particularities

In the cases studied, we noticed a social and human transformation. There was an improvement in the distribution of income and well-being. Also, we verified a reduction in migration from the locality to others, especially to the large urban centers. Twenty-five projects reaffirmed the identity of those who produce. They valued each participant, improved product quality, and promoted cultural redemption and local development. In the meetings, we perceived the construction of particular modes of engagement. There was the articulation of the "modern/scientific/western knowledge structures with the native/local/traditional knowledge formations" as explained by Santos (2006, p.540). The way of grouping the projects came from the figure of the "agent of fostering". By fostering we meant stimulation. This agent was the actor who incited, articulated, and sought to realize the partnership. Thus, we defined four narratives: "Beginning with the local makers", "Beginning with design", "Starting from an entity", and "With an academic foundation".

4.1 Beginning with the local makers

We selected the projects from Espedito Seleiro (figure 1), Doutor Borracha, Bordana Cooperative, and Capuchinhas de Montemuro. We have selected them because of their narrative, their attitude of high inventiveness. We saw the peculiarities and reflections in their production, and all of them were open to personal, technical, and economic development. That is because they are in a continuous process to have more quality and more authenticity. A process that reaffirms their way of life, which reverberates their culture.

We could see it through their symbolic and identity dimensions. When these artisans approximated with design, their material and immaterial culture conceptualized. The exchanges reflect the experiences and the sharing of visions of know-how. The artisans looked for instruments to define other strategies of singularization.

Nonetheless, they also searched for product innovations and to insert their products in the market. They seek autonomy as well to assume the means of production and distribution. This is not a search for technical improvement, although in some cases this has also happened. But to reinforce aesthetic, artistic, subjective, emotive and symbolic conduct.

Figure 1. The artisan Espedito Seleiro and the chairs from Cangaço Collection made in collaboration with Campana's Brother. Available at: http://blogs.diariodonordeste.com.br/cariri/cultura/mestre-espedito-seleiro-tera-exposicao-e-mostra-do-atelie-a-passarela-neste-dia-17-em-juazeiro-do-norte/6972#images https://casaclaudia.abril.com.br/ambientes/conheca-as-pecas-assinadas-pelos-campana-em-parceria-com-espedito-seleiro/

4.2 Beginning with design

The second narrative presented is that in which actions started with the designer. We studied the approach from designer Maria Fernanda Paes de Barrosem (figure 2) in three different cases. We also presented the work from the designer Marta Martins from Ecoarts in partnership with Vista Alegre. Jackson Araujo and Luca Predabon and the designers Alexandre Herchcovitch, Itiana Pasetti, and Marcelo Rosenbaum brought the concept of affective economy. Susana António is ahead of the Portuguese initiative "The grandmother came to work".

We understood that the proximity to craft puts the designer in the market from the territorial identity aspects. The locality is the support space of the experience. The production becomes more indigenous, relational and contextual, and with great historical reference. This is because symbolic values change the way of dealing with local resources and time. The designer starts to domain the production cycle and also the inseparability of the creative activity to the production process.

Figure 2. The artisan Zana and Ipezinho lamp made in collaboration with designer Maria Fernanda. Available at: https://www.yankatu.com.br/post/2018-11-13-encontros-zana-maria https://www.yankatu.com.br/alma-raiz/

4.3 Starting from an entity

There are several initiatives, institutions, and entities that seek to foster the encounter of a designer with local makers. They enable the dialogue between scientific knowledge and the tacit one. We studied projects initiated by SEBRAE in the Brazilian states of Piauí (figure 3), Amazonas, Tocantins, Rio Grande do Sul and Minas Gerais. The partnerships from private entities were also accomplished as the ones from Loulé City Council, Instituto Supereco, Instituto Elos, Instituto Campana, and Aga Khan Foundation. They understood the projects as vectors for territorial development processes. Ones that have cultural specificities as a basis.

Some of the projects work to safeguard traditional knowledge. They prevent the disappearance of traditional techniques. They also developed proposals for market insertion. This partnership also gave greater visibility and prestige to the artifacts produced. They even increased the community's sense of belonging with the awareness of their value and know-how.

Figure 3. The process of drying Carnaúba's leaves and a basket from the collection made with designer Marcelo Rosenbaum. Available at: http://rosenbaum.com.br/projetos/agtvarzeaqueimada/

4.4 With an academic foundation

There is a demand for interaction between teaching, research, and work with communities in some universities. We studied projects developed by the Federal University of Pernambuco, Federal University of Maranhão, University Center of Eastern Minas Gerais,

and Polytechnic Institute of Castelo Branco. The CEARTE (figure 4) with various educational institutions were also involved. Their action reinforced the academic contribution to a Portuguese region.

Figure 4. Schist Villages photographs and 'Sowing the Earth on the banks of the Zêzere River' by designer Vânia Kosta. Available from: Fonte: http://www.agriculturalusitana.com/pt/ http://dedalnodedo.blogspot.com/2015/05/agricultura-lusitana-i-semeando-terra.html

We noticed that the teachers' participation as advisors allowed the deepening of the issues discussed in the classroom. It is an inseparable theoretical and practical point of view. In the cases studied there was the empowerment of the students as actors of change in the real world. They found solutions to problems of local interest. As in previous narratives, there

was also the deconstruction of power. The teacher, the student, the artisan, and the technician were all collaborative subjects. They worked in partnership to create or improve a product. Each recognized their know-how. But they were open enough to influence and be contaminated by the other.

5. In search of the common

By analyzing these 25 partnerships as a set, common features became clear:

_All refer, by choice, to initiatives involving an artisan or a local production unit and a professional or team coordinated by a designer.

_There was an interest in safeguarding the know-how of those involved. There was also interest in renewing the way of being and thinking of each actor. Respect for cultural diversity was perceived. There were induction of capital gains and the strengthening of local identity.

We understood that doing is an integral and inseparable part of daily life. The use of co-creation methodologies is important because it recognizes each subject, each story, and each knowledge.

_Therefore, all case studies have a collaborative collective component. There were explicit principles of solidarity and democracy.

_There was the empowerment of a formal and/or informal network of production, marketing, dissemination, and distribution. There was also the increasing visibility of the developed project.

_The actions promoted emancipation and developed their management skills. They used a support system, which promoted and awakened business “vocations”. There was training, information, and financial support for improvement.

Finally, we realized that there is no separation between the production process and its territory. It is geographical, social, and cultural cartography. Yet, we also realized that each locality is unique, with its landscape and traditions. Each production unit is specific and presents its challenges, resources, and potentials. Each collaborative network organizes in its way. In short, we valued each meeting as unique even though all involved human and local development.

To measure the resulting impact, we focused on the actors involved. As we said, we did a questionnaire (Table 1). The verbalization of the individuals was an instrument to analyze each existing contribution. All the questions allowed us to infer meaning based on the experience of the subjects. We organized it into themes and categories. We reduced the impact to its essence. That is, we classified it into social, cultural, economic, and environmental impact.

As seen in the final percentages (figure 5), the results of the partnerships were positive, even in the least valuable items. There was also a greater awareness of know-how, motivation, sensitivity to environmental issues, sense of accomplishment, and happiness. These dimensions are under the components of well-being. Being part of a collaborative process is already an indication of an interest in personal improvement and openness to new experiences.

93,5% for local material improvement, cultural exchange, and know-how aware

83,9% for improvement in the process and the business enclosure, a new collection was made; identity was a value, participation in an event to present the partnership

80,6% for quality product improvement, and collaborative process

74,2% for the production as a territory refection

Figure 5. Some of the final percentages.

There was no major difference between the Brazilian and Portuguese cases. In both cultures, it was possible to measure the result of the partnerships. And the development of the entire group involved.

6. Final considerations

In spite of the complexity of the proposed, the research pointed out important parameters. They were capable of constituting a new basis of analysis for future design-craft partnerships. The relevance was in the use of multiple views. The social approach to design was evident. It acted as a catalyst for plural interrelationships. The designer, at no point in the investigation, was only as an artifact producer. On the contrary, the design presented itself as an aggregating discipline. It was a network builder, qualified to collaboratively create. It reduced inequalities and assumed the role to build bridges between different kinds of knowledge.

Local production connected subjects to their historical-cultural particularities. Their encounter with design altered identities while safeguarded existing cultural heritage. It was also noticed in the cases studied the promotion of local economies and the sense of belonging.

Finally, it was important to understand that we are all artisans as already presented by Francisco Providência and Richard Sennett. That is because the designer can transform, make another evolve, but he also changes. The impact is a two-way street. It is important to be open to exchange among the various areas of knowledge. The complementarity of

scientific and non-scientific practices fosters the dialogue. It signifies the world to do it better. To be better, continuously.

Abstract | "0_Textile" is a fabric conceived as a platform that integrates variable functions and performances. Designed to be inserted in a circular system that enhances function rather than production, it is characterized by a type of flexible use that fits into a dimension of resilience, which combines continuous service and remanufacturing with the principles of healthcare and comfort.
The first application that has been studied in terms of product characterization, and presented here, is dedicated to tourist 2.0 who is about to explore the "Near Space" in the near future. In this variation, "0_Textile" consists of a light textile structure which incorporates conductive gel and gradually released glycerol as well as a series of sensors that monitor vital parameters and make up for specific critical issues deriving from the space environment and the effects of the microgravity on the body.

KEYWORDS |RESILIENCE, NEAR SPACE, NEAR FUTURE, REMANUFACTURING, HEALTHECARE

1. Introduction

Starting from the study of a type of circular economy, which goes beyond the concept of waste disposal to make room for a reconditioning and reuse of the materials used, the research project "0_Textile" is configured as a surface that integrates different functions and devices, capable of changing configuration and adapt to a type of flexible use that fits into a dimension of resilience.

The concept of resilience has been explored in various aspects, in fact, it has been taken into analysis not only in its sense of adaptation of a specific system to change but also by understanding this concept from a psychological point of view. A personal level of resilience was explored, that is, the ability to cope positively with "traumatic" events, considering all those substantial changes in the way of life that can be expected in the future traumatic.

An example of these modifications is the new possibility to move concretely in the nearby space or the need to change lifestyle to be able to adapt it to the rules dictated by the looming need to reverse the trend of industrial drifts and meet sustainable challenges.

Starting from these ideas, a general design need emerged aimed at reorganizing and positively guiding the product towards the new scenarios that the future opens up to us on the horizon. Hence the intent to design "0_Textile" not as a finished and closed product, but as a platform that makes innumerable integrations possible and this means both different reconfigurations and different uses, numerous circular applications that do not end but are updated, they do not retire but replace and repair themselves to regain functionality.

During the research phase, "0_Textile" has evolved to accommodate an additional challenge that involves using it in the aerospace sector. In fact, from the analysis of the possible applications and possible recipients of the project, "Tourist 2.0" has been highlighted as an interesting experimental study object; in fact, among the various challenges that emerge on the horizon of a near future, the conquest of nearby space is in the first place.

If resilience is a relatively new concept in the Terrestrial field and is a pole towards which it is tending in recent years, in reality, this concept is rather rooted in the modus operandi of the aerospace industry, which exports above all in the "communities" that a type of circular economy is introduced in space trips, more or less long, which sees the reuse of different resources of which the space environment is lacking but which are indispensable (such as water for example).

In these places such as the international space station, where possible, reuse is the practical solution to various supply problems and an attempt is made to extend this practice to as many operations as possible to limit the impact of these shipments as well as to make them self-sufficient.

Given the imminent question that will open regarding an amateur use of space that will open the doors to the economy of travel in the "Near Space", "0_Textile" answers questions that will emerge in this area by proposing sustainable and reusable solutions that guarantee safety and comfort for the user.

In this scenario, in fact, the 0_Textile platform can be configured in order to solve physiological problems dictated by microgravity and then propose a check on return and a subsequent update that will make the fabric available for a new cycle of use.

The study presented here is based exclusively on the design of a textile which, in order to be used, will then need to be declined in a specifically designed functional clothing.

2. Scenario

2.1 Space Tourism

It has always been in man's ambitions to conquer the space that surrounds him, to study and analyze the inscrutable is an activity that has occupied many minds of the past until the advancement of technology has allowed an effective analysis of space culminating in exploratory extravehicular missions that made pure science fiction become real.

Today, that all this is part of the ordinary, a new scenario has opened up: the "Near Space". This neighboring space can sometimes take on purposes that go beyond research and exploration, trespassing in a newborn experiential dimension that is no longer only for sector experts but for anyone: the figure of a new user is configured, the "Tourist 2.0 ".

The phenomenon of space tourism, although quite recent, already boasts several isolated cases of space travel, mainly for entertainment purposes, financed by private individuals at exorbitant amounts.

According to Northern Sky Research’s 2021 report, space tourism market will increase in the next years, generating revenues of $7.9 billions by 2030. The market is driven by suborbital tourism, which will accelerate once Virgin Galactic and Blue Origin launches take place in late 2021. Orbital space tourism is reserved to wealthy individuals who are willing to pay great amounts for a ride; a more low-key role is led by parabolic flight tourism that offers zero-G rides at cheaper cost. Despite COVID-19 delays and decades of development, confidence in the technology is growing and new developments have been made.

If on one hand progress tends to democratize the space experience dedicated to users who are not in the sector, on the other hand it is true that these "tourists" will need special precautions to face the journey by not being experts and not being used to certain physical conditions.

0_Textile project starts from these assumptions and unfolds through the analysis of some of the critical issues encountered in these trips and through a series of discussions held with

experts from various sectors (biomedical, medical, engineering, physical) who collaborated together thanks to their complementary skills.

2.2 Sustainability in Space

Sustainability in space is not yet considered a major issue if compared to safety concerns, due to the limited number of spaceships launches. Nevertheless, the expected increasing of space tourism related launches pushes to focus on the inclusion of sustainability practices into the designing and development processes in the commercial space tourism industry. Travelling to space has an enormous environmental impact in terms of pollution and use of non-renewable resources. According to scientific calculations, 1000 space tourism related launches might produce consequences on climate, with a global temperature increase of up to 1°C. On the other hand, others claim that space exploration could lead to several benefits, such as finding alternative energy sources and materials or prevent human extinction through the colonization of other planets. The main public and private actors in space exploration are well aware of these risks and are working to introduce sustainability in their practices.

European Space Agency (ESA), for example, is pursuing many projects addressing sustainability in space, such as the Clean Space Initiative started in 2012, which goal is the space debris mitigation and remediation across the space industry development chain.
NASA made important efforts in developing a sustainability policy in order to guide their operations. Its main goals include: increasing use of renewable energy, reporting, measuring and reducing greenhouse emission, preventing pollution, eliminating waste, increasing recycling, protecting and conserving water resources, managing and evaluating their operations and missions' effects in short-and-long term, operating under all regulations and laws regarding healthy environment, environmentally-sound operation and energy security (Serafini, 2019).

Maximizing resources availability through reuse or recycling, however, is not a new concept in aerospace industry. The high cost of space missions pushes to adopt new solutions. Orbital debris, mission waste and materials found in space can be used as new resources. The idea of producing directly in space is at the core of NASA's In-Situ Resource Utilization Project (ISRU), which aims to use materials found in space such as lunar ice, soil or metals and producing on site, using techniques like 3D fabrication. The first 3D printer in space was used in 2014 by astronauts aboard International Space Station (ISS).

Other virtuous examples of reuse include reusable rocket systems and engine, supported by the adoption of modularity. Another important issue regards the use of more sustainable alternatives for fuels. Blue Origin's new Shepard, for instance, uses liquid hydrogen and liquid oxygen as propellants, which could potentially be collected from the surface of Moon or other planets.

In the next future, the integration of sustainability into the space economy could lead to a cost decrease in space missions, that could in turn provide a cheaper access to space and boost the space tourism market.

3. Research development

The first step towards a real characterization of the "surface" fabric, which is useful to the space tourist, was the cataloging of the critical issues that this individual encounters in the space environment in order to elaborate concrete answers in terms of interventions and materials used in the project. As project parameters, only effects found in a maximum stay of 7 days were considered, in line with the current stay offers.

Table 1. Classification of critical issues encountered during space travel. (only those relating to short-term stays have been reported here as a maximum stay time of 7 days has been set as a design parameter, in line with current travel offers).

Critical issues encountered in the short term	Effects on the body
Epidermal thinning	- itch - dry skin - thinning of the skin - increased sensitivity - delayed wound healing - greater tendency to skin infections - decrease in skin fiber density - loss of elasticity - different or normal skin aging
Temperature increase	- prostration - skin dehydration
Different distribution of fluids	- proprioception disorders (balance and perception of the body in space) - neuro-ocular syndrome

The "clinical panel" of a hypothetical user has been reconstructed by following the consultation of numerous studies. However, since most of the subjects that have been used as a sample for monitoring on the international space station or by the national

organizations from which the tables with the reported statistical data are built, are mostly men astronauts and being the female astronaut a minority, there are not many data relating to the changes that occur on the female physique or in any case the number of data collected is not sufficient to trace the standard clinical picture that is outlined with certainty.

This has meant that the considerations made from here on are generic and do not consider the differences between men and women that normally occur in the Earth environment as they have only been hypothesized but have not been verified.

In conditions of microgravity and psycho-physical stress, some pro-inflammatory responses are triggered which are responsible for the rise in temperature that occurs during space travel. Normally, the organism manages to maintain a constant internal temperature around 37 ° C by transferring heat by means of thermal radiation, convection and evaporation.

The contribution of each of these phenomena may vary based on the effort being made, environmental conditions and the state of hydration. In space, lowering mechanisms such as sweating are ineffective since the sweat evaporates more slowly than on Earth and the body heats up quickly. With the increase in temperature, dehydration of the skin and the formation of ideal environments for the development of unwanted microorganisms (i.e., fungi, bacteria) are encountered.

To this general situation is added the fact that the bloodstream, in conditions of terrestrial gravity, does a great job of going up from the peripheral areas of the body towards the center: the beating heart. In microgravity, however, this effort is reversed since the rise of the blood is not hindered by gravity. It follows an accumulation of body fluids in the upper half of the body with consequent accumulation of interstitial fluid and swelling of the upper limbs and face, as well as worse spraying of the lower limbs with a consequent lowering of the local temperature.

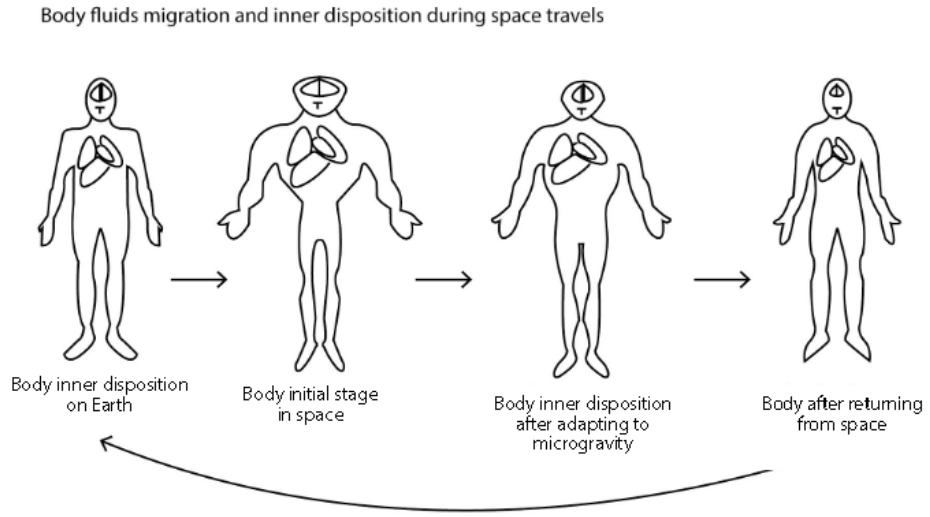

Figure 1. Scheme of body fluids arrangements during different phases of exposure to microgravity (on Earth, in the first phase of exposure to microgravity, after the adaptation phase and on return to the mainland)

By submitting these elements that emerged from the research to a team of dermatologists made up of Doctor Giuseppe Argenziano and of doctors Elisa Fulgione and Caterina Giorgio, it was possible to frame the problem and hypothesize the solution.

The specific problems submitted to them concerned:

• causes of epidermal thinning;

• possible unwanted collateral effects;

With a view to the use of what is available and a minimum supply of extra material for the design of this fabric, the research footprint has been conservative since the beginning. In fact, rather than hypothesizing additional solutions, we have been conceived only solutions that are able to preserve the natural state of the subject's body, and specifically its skin, preventively limiting its surface alteration and the subsequent problems that it could have triggered. Starting from the distinction between infantile, young and mature skins, which are those that undergo physiological xerosis, we have derived a constituent pattern of the skin considering how the psychophysical characteristics that this type of travel implies are limited to an age group between 20 and 65.

Considering how the skin's condition is optimal thanks to the action of three substances: glycerol, ceramides and fatty acids, defined by the doctor as real "bricks" constituting skin external protective film, we have faced the idea of preserving it during the decline determined by the rise in temperature.

They have analyzed a long relationship between these three substances but, in particular, it is clear that glycerol is particularly important for maintaining the other two. This is the definition of the first characterization that the "0_Textile" must support: a release of glycerol which allows, during the stay, to contrast tourist's xerosis and, for domino effect, thus limited the problems that the dehydration derived from temperature rise produced.

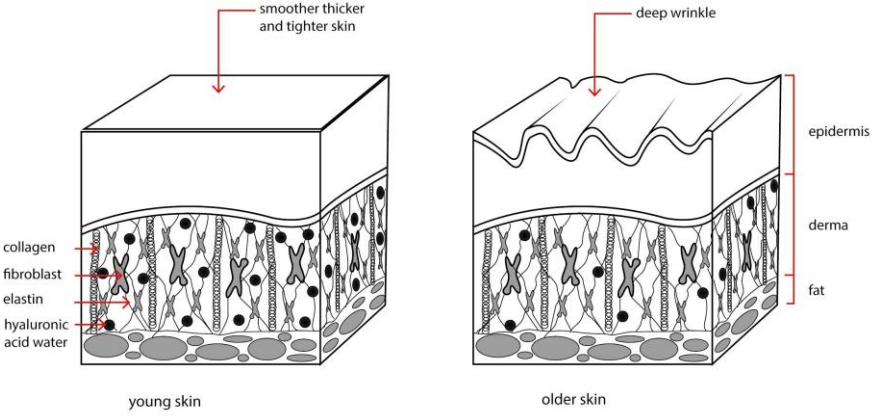

Figure 2. Differences between young and mature skin

On the issues related to the monitoring of vital parameters during the trip I collaborated with Dr Francesco Coppolino, specialized in cardiology, who provided valuable information about sensors useful for monitoring blood flow, pressure and heartbeat that can constitute a complete and constant basic clinical picture throughout the duration of the stay.

In fact, thanks to the monitoring of the user's blood pressure and heart rate, it is possible to have effective control of the health of the tourist during his stay in the space in microgravity and to be able to administer timely corrective interventions if any decompensation occurs.

Always keeping as the axiom of the project a conservative approach of the status quo of the user, as well as the idea of making a minimum use of material within the project, the first step in this sense was limited to the observation of the adaptations that the body makes in

microgravity conditions as defense of the organism against a new and unknown situation. Also, in this case with the specialist, it was agreed that intervening first on the pressure and the movement of the fluids that was expected, would be counterproductive by subverting the natural balance that the body would try to establish.

With the help of the doctor, simple cardiographic and blood pressure monitoring systems were identified. The concept is to obtain triangulation of the heart by strategically positioning plaques on the tissue with sensors that return a stable electrocardiographic signal.

To record the trace, the electrodes are positioned as follows: red electrode = left limb, yellow electrode = right limb, green electrode = lower right limb, black electrode = lower left limb, white electrode = abdomen or back (used to stabilize the trace). The fabric will be designed to accommodate these electrodes with a thickness of about 2 millimeters in its cavity, but their actual positioning will be drawn up when declining the "0_Textile" surface in functional clothing for the Near Space.

The issue of blood pressure monitoring was resolved by creating small watertight compartments in the cavity of the tissue; by blowing air into these cavities of the fabric, which have reduced elasticity, the fabric opposes the expansion of the "pocket" and produces pressure on the affected area. At this point, by positioning a small sensor that records the vibrations of the lamellar flow of the blood thus compressed and made turbulent, the user's diastolic and systolic pressure is recorded in real-time.

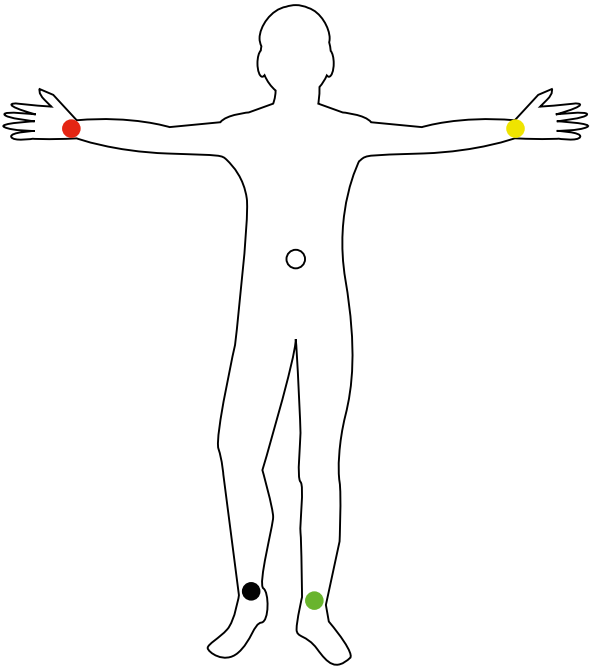

Figure 3. Scheme of positioning of the electrocardiography plates

The third advice I used was the one given to me by the engineers Massimiliano Masullo and Michelangelo Scorpio with whom I longly discussed about the possibilities of using sensors and actuators capable of dissipating some of the body surface temperature so as to allow at least a local lowering of the skin temperature and offer greater comfort to the user.

Considering the links between body temperature and heart rate, it has been shown how a slight drop in temperature can be useful in slowing down the rate and improving blood circulation. For the choice of sensors to be integrated, the study focused in particular on the use of "Peltier cells".

They are devices made up of 2 plates of very thin ceramic material which perform the following function due to the difference in potential between them: one of the two surfaces emits heat and the other absorbs it. In this way, the lowering of the surface temperature of the air at higher risk can be triggered and the opposite effect can be generated by slightly heating the surfaces of the lower limbs which are instead colder.

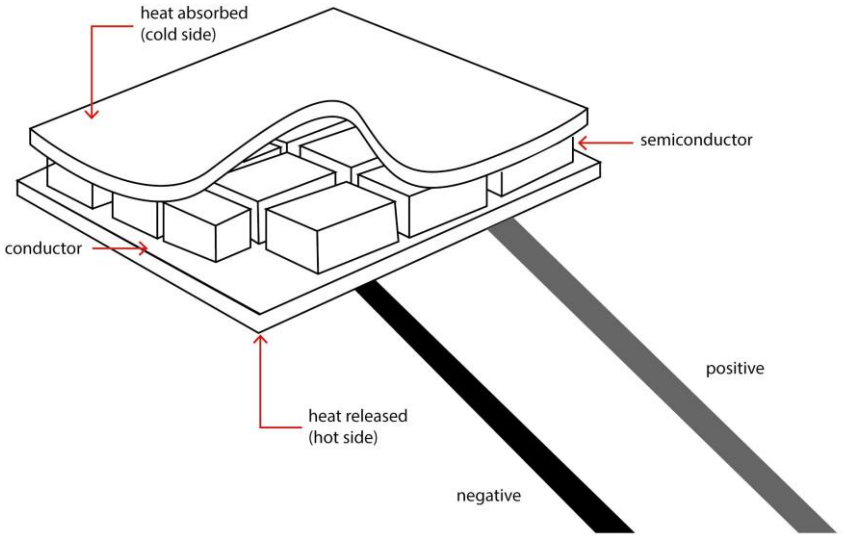

Figure 4. Functional diagram of the Peltier cell

Considering these researches particularly developed in many other areas and with satisfactory resolutions, I set myself to address these issues from a non-specialist point of view but aimed at creating a product that can be used by newbies tourists 2.0.

4. 0_Textile project

Concerning the elements that emerged from the field research phase, the design of "0_Textile" is focused with an impalpable structure made up of very thin and resistant weft and warp that supports a conductive gel (ECG type) with a reduced specific weight.

Glycerol microcapsules are housed inside the gel; this substance is released gradually according to a capsule design differentiated according to the user's residence time. There are in fact two types of release that have been identified: the matrix one and the tank one. The former releases the substance progressively with a decreasing dosage while the latter is more constant over time than on the basis of the thickness of the polymer that hosts it can have different periods of action.

The sensors that allow dissipating the heat, the Peltier cells, which have a surface of about 2 square centimeters, will be inserted inside the gel which, thanks to its conductive action, allows to amplify its effect by increasing its range of action on the skin. The sensors aimed at monitoring the vital parameters will be inserted outside the gel film and therefore in contact with the skin but will also be housed in special spaces in the fabric.

Finally, the small cavities, which will house the insufflated air producing a slight pressure on the skin, are obtained by welding two layers of the fabric, internally covered with insulating material which makes it effective as small circuits with sealed compartmentation.

"0_Textile" will be configured as surface that hosts different sensors and glycerol and will bring benefits and comfort to the space tourist. The fabric thus obtained is declined in the specific garment that is intended to be obtained so avoiding waste or surplus, being produced on a small scale, it can go through countless cycles of "remanufacturing" while keeping performance unchanged and even allowing an "upgrade" using minimal energy input without any addition of accessory material.

The application of "0_Textile" in the context of the creation of clothing for the "Tourist 2.0" is inserted within a cycle that involves the production of a certain stock which at the end of each exploration is regenerated, optimized and made available for subsequent trips. For this purpose, the next step of "0_textile" design turns towards the definition of a cycle of services (performance economy) that monetize operations capable of triggering product repair and enhancement processes, making "appealing" solutions generally excluded from traditional linear industrial economy and promoting a constant service that restores vitality to the product while maintaining high performance.

From a practical point of view, in a rapidly expanding sector such as that of private space explorations (for entertainment purposes), the need to create a type of clothing that supports the problems faced by the body when exposed for long periods to the microgravity or the so-called "weightlessness" effect. There are many solutions proposed by multiple specialized agencies and there are many experimental technologies used to design clothing that can be worn especially during the travel phases to reach the space site.

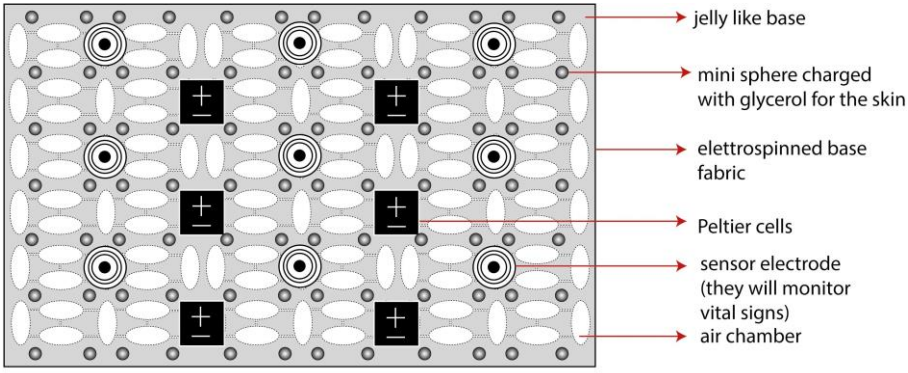

Figure 5. Integration scheme of 0_Textile internal surface

The fabric designed here is proposed as a base to be used below these structures, perfect engineering works many of which have already been consolidated, like a film, a sheath to wear during the entire duration of the user's stay; the purpose is to fill the interspace between the suit and the user's skin, guaranteeing comfort and safety.

With the creation of the fabric on a gel basis, a high percentage of the same will be made up of water, the glycerol inserted in such quantities as to be sufficient for a release that corresponds to the needs of an average user within 7 days, will be included in the gel in specific doses that guarantee complete absorption, significantly reducing waste.

The sensors, properly set at the end of each cycle of use, can perform their function for a considerable period of time and then be especially updated through software as well as inserted in regeneration processes which, using the constituent materials, are able to offer sustainable and advanced solutions. to be returned to the cycle of use.

4.1 Planning

Finally, the small cavities, which will house the insufflated air producing a light pressure on the skin, are obtained by welding two layers of the fabric, internally coated with insulating material that makes it effective as small circuits with sealed compartments.

The design of "0_Textile" is to be understood as a base surface to be used under engineering textile structures; it houses different components that as sensors or glycerol, will bring benefits and comfort to the space tourist.

The textile thus obtained:

- is declined in the specific garment that is intended to be obtained avoiding waste or surplus because specially designed;
- is regenerated, optimized and used for future trips in a cycle of "regeneration" that supports constant vitality services for the product;
- is declined in high performance solutions for advanced functionality when the same regeneration takes place following the experimental technologies and innovative materials in step with the progress of research.

The "0_Textile" fabric, as versatile as it is and placed in a circular process, can be said to belong to the fabrics obtained from materials programmed to respond to specific needs of the body in a specific context of use. The placement in the interspace between the suit and the user's skin is intended to respond to advantages in terms of *commodity, utility, facility.*

If on the one hand the use of glycerol has been the most recommended - as it helps to maintain skin hydration by slowing down the appearance of signs of aging and skin deterioration - on the other hand, a valid alternative still incorporated in the conductive gel of the basic textile structure - considers cross-linked hyaluronic acid.

Cross-linking, i.e., the union of linear hyaluronic acid molecules by means of a chemical bond, determines the formation of larger and more stable lattices that equally protect the skin from enzymatic degradation, guaranteeing a longer residence time at the site of application and a longer duration of action. This means that to achieve the same benefit, fewer administrations are required with cross-linked hyaluronic acid than with linear or glycerol; the result is an increase in the effectiveness of the benefit with a minimal amount of material even in the short-term user journey.

In the vision of programmable, regenerated and optimized textiles, taking advantage of nano-material progresses, it happens that the ability to subsidize different needs of the body is expanded. Micro-encapsulation with phy drugs or other substances contributes to the design of healthcare nanotechnologies that mediate bacterial infections or localized inflammation, as seen in aerospace.

The development of a textile base structure with Peltier cells as sensors and actuators - capable of managing the energy expenditure caused by localized rises and falls in body surface temperature - would find increased performance if a portion of the excess energy produced by humans themselves is stored to power wearable devices. The energy expenditure would do the same job as a watch battery with cleaner, more recyclable technology.

The connection of sensors to less hard electronic components results in the development of e-textiles that increase user comfort while in action, making the condition of data acquisition and monitoring imperceptible; in addition, for a more systematic study of the human body in conditions dictated by microgravity, the sensor component could include the manufacture of mini robots that in symbiosis with the body, can help to store information about the criticality of the body, to date still little known, becoming an opportunity for progress in

telemedicine, for human-computer interfaces and the study of the body at a distance. The sensors, properly set at the end of each cycle of use, can perform their function for a long period of time and then be particularly updated through the software as well as inserted in regeneration processes that, using the constituent materials, are able to offer sustainable and advanced solutions to return to the cycle of use.

5. Conclusion

At the end of the product design phase and the possible cycle of services which sees it included in a remanufacturing process, the prototyping and identification of the specific characteristics of the constituent materials are preceded by the resolution of the open questions during the assembly of the different skills requested o the product. In fact, following the consultations, there are several aspects that required a review because of the interconnection between the multiple disciplines involved and the related fields of action of the individual experts. The need, therefore, arises to further investigate the following aspects:

- Consider a relationship between blood pressure, the core temperature of the individual and dehydration of the skin in a short time span of 7 days with parameters and conditions referable to those present in microgravity;
- Check the range of glycerol activity and the release quantities that the body takes; calculate an effective dose for a release of 7 days
- Consider the degree of possible compression so that turbulent motion is triggered and blood pressure can be recorded, designing watertight cavities in which to blow air if necessary, and using a bottom fabric capable of offering resistance to the expansion of the cavity (value of the modulus of elasticity called Young's modulus rather high);
- Consider a thickness of the order of 5 mm for the finished fabric;
- Consider a specific weight of the finished fabric of the order of 100 gr/m2;
- Consider the use of renewable technologies on the platform, avoiding the use of sensors with programming limits; rather look for technologies that oppose obsolescence through the separation and replacement of the individual constituent components.

About the Authors:

Maria Antonietta Sbordone Associate professor in industrial design deals with research on innovation in fashion and design eco-systems linked with the circular economy in goods and service productions. Tutor of the research proposed in this paper, contributes to the assessment and to the conceptualization of the research theme, building the interdisciplinary panel of experts to have a large discussion to achieve the established findings.

Viviana Vollono Master' degree in fashion design scholarship carries out research of the paper proposed at Officina Vanvitelli hub of the Department of Architecture and Industrial Design of the University of Campania "Luigi Vanvitelli".

Carmela Ilenia Amato Master' degree in Fashion Ecodesign at the University of Campania, Italy. She collaborates with research groups in fashion design on biomaterials and digital fabrication developing smart, innovative and sustainable fabrics.

Barbara Pizzicato PhD student in Environment, Design and Innovation at University of Campania, Italy. Master's Degree in Fashion Ecofashion, her fields of interest are from Product to Fashion Design, focused on Communication, in both theoretical and practical aspects.

Acknowledgements: We would like to acknowledge the following experienced professionals who follow the research and with their precious collaboration we have created an interdisciplinary network, which are: the dermatologist of the Policlinico Nuovo of Naples: Dr. G. Argenziano, and two other collaborators: Dr. Elisa Fulgione and Dr. Caterina Fulgione; cardiologist, Dr. F. Coppolino; engineers M. Masullo and M. Scorpio.

Although the authors have shared the general line of the paper, however, the chapters are attributed as follows.

Maria Antonietta Sbordone has drafted the following chapters: Abstract; 1. Introduction; 2.1 Space tourism; 4. 0_Textile Project; 5. Conclusion.

Viviana Vollono has drafted the following chapters: 3. Research Development.

Carmela Ilenia Amato has drafted the following chapters: 4.1 Planning.

Barbara Pizzicato has drafted the following chapters: 2.2 Sustainability in Space.

Abstract | Cave dwelling (Yao Dong in Chinese) is a form of architecture with high ecological value, maintaining the balance of natural ecology and sustainable development. The advantages of living in cave dwellings, such as warm in winter and cool in summer, and its co-existence with nature, are well-known to the world. Meanwhile, the ecological features of its traditional construction skills and the ecological wisdom left by our predecessors are worthy of our research and inheritance. This paper re-recognizes the traditional cave-dwelling construction skills, the cultural value and ecologic sustainable value of cave dwellings from a novel perspective of the resilient characteristics of the ecosystem. Consequently, it promotes the formation of traditional residential protection mechanisms, and enables the sustainable research results of traditional construction skills to be applied to modern residential buildings, making buildings more energy-efficient and people 's living environment more comfortable, healthy and environmentally friendly.

KEYWORDS | SUSTAINABILITY, TRADITIONAL CAVE DWELLING, NORTHERN SHANXI PROVINCE (JINBEI AREA), RESILIENCE

1. Cave Dwellings and Environmental Resilience

1.1 Overview of Cave Dwellings in Jinbei Area

The Jinbei area refers to the Northern Shanxi Province, China, including Datong, Shuozhou, and Xinzhou areas. It is adjacent to the Inner Mongolia Autonomous Region in the north, Shaanxi Province in the west, and Hebei Province in the east. Located at the northern part of Loess Plateau, mountainous Jinbei area has varied landscapes and diverse terrains, which is relatively complicated and barren. They are mainly wind erosion and belong to the geology of the Maowusu Desert. The cave dwellings in China have a long history, and the relatively well-known prehistoric one with horizontal style appeared at the end of Yangshao culture around 3,000 B.C. [1] Up to now, the traditional Chinese cave dwellings mainly consist of patio-style, by-cliff-style and independent-style (Figure 1). [2] Due to the uneven distribution of loess and the different geological composition in different regions, the types of cave dwellings presenting in different regions also have different characteristics. Most of cave dwellings in Jinbei area are by-cliff-style and independent-style, because independent-style cave dwellings have the convenience of not being restricted by geological conditions. In Jinbei area, where the geological composition of soil and stone is not evenly distributed, the independent-style is the generally selected one to be built.

Figure 1. Traditional Chinese Cave Dwelling Style (Photo by Author)

Patio-style Cave Dwelling // By-cliff-style Cave Dwelling // Independent-style Cave Dwelling

1.2 Environmental Resilience

In the study of cave dwelling and its environmental ecosystem, resilience refers to the ability of an ecosystem and social system to continue to function under accidental and severe disturbances. Resilient ecosystem is the backbone of sustainable environmental support systems. The key of having resilience is to anticipate how things will break down and prepare for the worst outcome. [3] The resilient characteristics of cave dwellings and cave dwellings environment are a strong guarantee to promote the benign operation of the ecosystem. In natural and human systems, cave dwellings and their own resilience adjustment functions have made the relationship between people and nature ecologically integrated, and have

formed a good situation of harmonious co-existence and sustainable development between the two systems.

1.3 Cave Dwellings and Environmental Resilience in Jinbei Area

The cave dwelling environment in Jinbei area use the phase transition resilient characteristics of cave dwellings to adapt to changes of natural environment in the manner of “follow” and “welcome” [4]. The construction of cave dwellings adapting to environment reflect the characteristic of “follow”. The phase change properties of cave dwellings in response to seasonal, day and night temperature and humidity changes reflect the resilient characteristics of “welcome”. The cave dwelling in Jinbei area is a type of passive architecture built according to local conditions, local materials, regional situation and natural environmental conditions. It not only did not cause any damage to the natural system, but also coordinate the harmonious co-existence of human and nature, creating an ecological balance between them. In winter, the temperature inside cave dwellings is 10°C higher than that outside, while in summer, it is about 10°C lower. [5] The author monitored, analyzed and compared the temperature and humidity of villagers’ cave dwellings, brick houses, and outdoor areas in Gaoyang Village, Shanxi Province for 24 hours (Figure 2). It can be seen from the analysis chart that the temperature and humidity of cave dwellings are relatively stable when those of the outdoor fluctuate greatly. The temperature and humidity of cave dwellings are more suitable for human beings to live in. This resilient function with resistance to temperature changes effectively regulates the temperature in the cave dwellings, making it more suitable for people and can also save a lot of energy consumption.

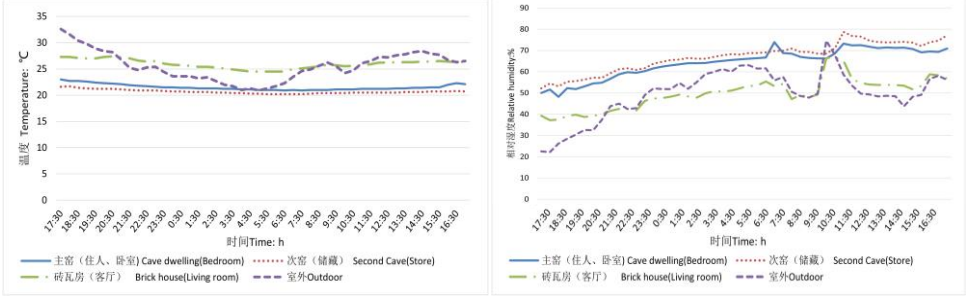

Figure 2. 24 -hour measurement and analysis of the temperature and humidity of villagers’ cave dwellings, brick houses, and outdoor areas in Gaoyang Village, Shanxi Province.

Measurement by Author; Time: June 23rd to 24th, 2019, from 17: 30 to 17:00 the next day;

Therefore, the cave dwellings in Jinbei area have the ability to respond to changes in the natural environment system, which is incomparable to our modern ordinary houses. When ordinary houses are built, they are not capable of adapting to natural environment, so most

of the buildings systems are made as independent as possible by means of active artificial intervention, such as waterproof and fire prevention. In addition, its ability to resist changes in natural environment is also weak: in the winter, more energy is needed to maintain heating; in the summer, air conditioner is required to cool down. The cave dwelling, on the other hand, only needs a small amount of energy to create the temperature environment needed to maintain the human body. The resilient advantage of its own not only does no harm to nature but also works in harmony with natural systems.

2. The Resilient Characteristics of Traditional Cave-Dwelling Construction Skills

2.1 Simplicity and Reproducibility

Reproducibility and repeatability are obvious in natural ecosystems and are also characteristics of ecological resilience. The by-cliff-style and independent-style cave dwellings in Jinbei area have the features of convenient construction, simple structure, material saving, health and environmental protection. Therefore, these two types of cave dwellings are widely applicable in Jinbei area, especially in the Loess Plateau area where wood is lacking. The “simplicity” is reflected in that cave dwellings do not require an additional supporting system. The wall and ceiling are integrated into one structure. One can use the most common natural materials to build cave dwellings. From the perspective of material classification, cave dwellings can be divided into adobe-made, stone-made and brick-made. (Figure 3)

Adobe Cave Dwelling // Stone Cave Dwelling // Brick Cave Dwelling

Take the independently constructed adobe cave dwelling as an example; it mainly uses adobe that each of it is 36cm in length, 15cm in width, and 8cm in thickness as the building material. The legs of cave dwellings are first built, with the support of wooden timbering. Then, the adobe blocks are used to build the vault layer by layer. According to the local residents, if there is no wooden timbering, the soil can be filled between the two legs to form an arched mound. Workers build a vault on the mound, and then dig out the soil inside the cave dwelling to pave the courtyard or cover the roof. This is called “tu niu” method. After the completion of main structure, the face of the cave dwelling is made. Usually, the doors, windows and vents are on the face. Finally, the top of the cave dwelling is covered

with soil to complete the whole construction of it. Whether the cave dwelling is made by adobe, stone or bricks, the construction methods are similar, except that the materials used are different. The materials used to construct the cave dwelling form the structure, dividing the cave dwelling into internal and external environments. Although the construction materials and techniques are simple, the thermal environment generated cannot be underestimated. Cave dwelling is a type of building with high ecological benefits. Different from bulk-built houses, the repeatability of cave dwellings is mainly reflected in shape and construction method, but the details are different. Each piece of material is derived from natural resources that are relatively easy to obtain and is adjusted to the actual situation during construction. So the reproducibility of cave dwellings is organic, which reflects the flexibility and resilience of traditional cave dwellings in dealing with natural environment.

2.2 Non-standard Forms in the Standard

Rudolfsky of the United States called cave dwellings or similar vernacular buildings "architecture without architects". [6] For a long time, the idea that “what is made by machines is perfect” has become an aesthetic standard for people, but now people have begun to admire irregular and gentle beauty, and pursue skills in manufacturing and processing natural construction materials. The traditional Chinese cave dwellings seem to be built according to a standard, because the external forms and the internal functions are similar. However, careful mappings show that almost none of the cave dwellings are completely the same in size. The construction materials are slightly different, even for adobe and stone cave dwellings. The mixing proportion of mortar and clay and the method of using it are also greatly different. Heating methods are also varied. Generally, the heating in the cave dwellings is through the stove connected with fire heating (Fig. 4). In Zhaishang Village, Baode County, Xinzhou, villager Wang Zaiqiang adopts the floor heating method (Fig. 5). Therefore, the furnace heating principle of the cave dwellings is the same, but there are differences in the operation mode. In fact, there are many changes in the heating methods and positions of cave dwellings: some of the stoves pass through heated *kang*; some through the chimney; some are set outside the cave dwellings. Based on the different needs, each household will have different arrangements.

Although the number of caves in cave dwellings generally appears in odd number, even-number caves are also common, and there are square-shaped caves. Depending on the surrounding environment, independent-style cave dwellings could be combined with by-cliff style cave dwellings, brick-made cave dwellings, and integrated with traditional courtyard houses. Therefore, the structure of caves is arch shape. The flexible and diverse environment presenting by cave dwellings and their combinations reflects the resilient freedom of non-standard forms in standard.

3. The Resilience and Sustainable Development of Traditional Cave Dwellings and its Living Environment

3.1 The Adaptability of Low Dependence on Human Input

Figure 5. Schematic Diagram of the Cave Stove of Wang Zaiqiang's Cave Dwelling in Zhaishang Village, Baode County (Photo by Author)

A sustainable human ecosystem is associated with less human input in the ecosystem. Nature dominates most things, but a large amount of human input will reduce the resilience of the natural system. Since mankind's needs and desires are endless, his continuous investment in fulfilling his own desires is boundless. One day, when the society and nature cannot afford endless expenditures, human beings would face punishments from society and nature. Traditional cave dwellings in the Jinbei area have become a model of ecological

architecture due to their adaptability of low dependence on human input. In the whole life cycle of the construction, use and abandonment of cave dwellings, the energy consumption at each stage is relatively small, and the abandoned soil, stone and other materials can once again become natural resources and be reused. In comparison, buildings in cities must rely on a large amount of human input to function properly, and maintain a balance between man and nature in a highly dependent and high-consumption manner. Of course, from the perspective of living comfort level, the buildings in the city are much more comfortable than the cave dwellings, which is why a large number of residents used to live in cave dwelling leave their original places to build new houses. Therefore, improving the living comfort level of cave dwellings, matching the new lifestyle of modern people, and solving the dilemma of traditional cave dwellings being abandoned are the main difficulties in cave dwelling research. Since the current status of cave dwelling development is not optimistic, we urgently need to find practical path to develop cave dwellings.

3.2 Application of Appropriate Technology

"No-energy-consumption" or "low-energy-consumption" buildings are more suitable for rural construction. The existing traditional buildings in rural China, especially cave buildings, can be considered as "no-energy-consumption" buildings because they have characteristics such as heating from natural resources, no air conditioning, low population density, low electricity consumption and so on. However, the quality of life of rural cave dwellers is not high, and the living environment and surrounding supporting facilities are relatively backward. Therefore, the purpose of cave dwelling research should be to help cave dwellers improve the living comfort level of cave dwellings and improve the supporting services of living environment based on energy saving. Low-tech construction technique is one of the ecological characteristics of traditional cave dwellings. Using low-tech method to protect and repair cave dwellings is the main technique. With the rapid development of modern science and technology, the application of high-tech has attracted much attention in various fields of society. However, at this stage, pursuing the application of high-tech is not the first choice for the development of traditional cave dwellings. It should be suitable for the actual needs and selectively use low-tech and high-tech, that is, appropriate technology. Appropriate technology is the technology that should be chosen for the development of traditional cave dwellings. At present, the residents of Zhaishang Village, Baode County, Xinzhou, in Jinbei area has applied appropriate technology in the living environment of cave dwellings. For example, villager Wang Yongqiang's family has already used solar energy, biogas, vegetable greenhouses, rainwater collection, waste recycling, breeding and other appropriate technology (Fig. 6). Raising pigs and poultry provide economic income for the residents. The feces of pigs and poultry could be used to make biogas, which meet the needs of boiling water, fertilizing vegetable greenhouses and so on. The collected rainwater is used for watering vegetables, old wine bottles are used for building barrier walls, and solar panels are used for supplying electricity. Each format and facility complements each other to form a complete system that integrates with the natural environment system and human living

system as a whole. The living system of Wang Yongqiang's family is a relatively good attempt to apply appropriate technology. Of course, there are also some problems during operation. For example, when the temperature is not high, the existing biogas equipment does not have good production of gas. The flow direction is not well-organized, thus the amount of rainwater collection is relatively limited. These problems need to be further solved. Therefore, the application of appropriate technologies requires long-term exploration to form and improve. The appropriate technologies suitable for cave dwellings also include three-dimensional greening, wind energy, optical fiber tube, Trombe wall, and sunlight room, etc. All of these reflect the functions and role of practicality. Combining with high-tech, low-tech and traditional wisdom, appropriate technologies should be widely promoted. It is an integrated technology that is suitable for the current situations and is also a system matching the original one. Through the application of appropriate technologies, the resilience of cave dwelling can be enhanced to make it closer to the needs of people, and to achieve the harmonious co-existence among human, nature and environmental ecosystem.

4. Conclusion

In summary, the resilient characteristics of traditional cave dwellings in Jinbei area are reflected in aspects such as simplicity, reproducibility, non-standard, diversification, and adaptability of low dependence. There are many other aspects worth studying and researching, such as the biodiversity of cave dwelling environment and the multi-functional applicability of cave dwellings, etc. Many people would think of poverty when traditional environmental-friendly buildings are mentioned. In fact, simple and localized buildings can give residents more space for self-expression and allow them to get closer to nature. [7] From the angel of resilient characteristics, this paper researches and discusses the sustainability of traditional cave-dwelling techniques in Jinbei area. In this way, the unique internal mechanism can be explored from. It can also enlighten us to re-understand the values of cave dwellings from the exterior to the interior, inspiring us to use the resilient law of cave dwellings for ecological design.

Abstract | Sustainability has become increasingly important for the fashion industry to take ownership of which Governments support by enforcing regulations on manufacturing industries to reduce waste. Some fashion brands have recognised the economic benefits of a circular approach to production and collaborative approaches through textile innovation and the role of fashion designers to design sustainable products with minimal waste. The aim of this research is to explore the creation of zero -waste fashion garments intended for the ready-to-wear sector through a holistic Fashion Designer- Creative Pattern Cutter approach that considers garment lifecycle and environmental impact. Viewing the textile waste problem from a designer perspective, a small range of garments were created from one or two single pieces of cloth, incorporating a no-cut policy which allows garments to be deconstructed when no longer required. This enables the cloth to be easily remade into other garments as desired. The collection supports this sustainability-led fashion concept.

KEYWORDS | CIRCULAR DESIGN, ZERO WASTE FASHION DESIGN, SUSTAINABLE FASHION, CREATIVE PATTERN CUTTING, RE-DESIGN

1. Introduction

The aim of this research is to explore the creation of zero -waste fashion garments intended for the ready-to-wear sector through a holistic Fashion Designer- Creative Pattern Cutter approach that considers garment lifecycle and environmental and social impact. A study of early zero waste fashion design was undertaken, both historical and within contemporary fashion, to understand the possibilities for producing zero waste garments, which not only produce no waste at the initial cutting stage but also provided possibilities for producing a zero-waste collection of garments with the potential to become part of a circular design process. As the researcher has a background in fashion design and creative pattern cutting, this laid the groundwork for the project experimentation. What became significant in this research was that the designer needed to consider end of life possibilities for reuse and/or recycle, at the initial design stage , a process which has previously been overlooked by many designers and fashion industry brands. This design for end-of-life use, allowed for possibilities of future value creation of garments within a circular design process.

What we can say about design is that it is the discovery of something new, and what we would also now accept, in the light of the environmental cost highlighted in the fashion industry, is that good design must include some level of sustainability. The environmental sustainability problem requires widespread action now to eliminate the issue of waste within the fashion industry and slow the depletion of natural resources. The average person buys 60 per cent more items of clothing every year and yet only keeps them for about half as long as they would 15 years ago, consequently producing immense volumes of textile waste. This trend, exacerbated by the 'fast fashion' market, has led to a system overloaded with unwanted clothes. It is estimated that more than half of 'fast fashion' produced is disposed of in under a year either to landfill or is incinerated (Remy et al,2016). As Remy states, 'each year, the EU alone generates 1.5 to 2 million tonnes of used clothing, much of it unsalable due to poor quality' (2016). The linear model of take-make-dispose is hugely wasteful and destructive to the environment and despite this the global demand for clothing, particularly in developing countries, looks set to rise. With a US $3 trillion global industry employing over 300 million people (Strijbos,2018), it is a significant undertaking to educate diverse brands and manufacturers about the merits of becoming more sustainable, environmentally and economically, "addressing the social aspects of continuing mass consumerism and mass production is becoming equally imperative" (Flinn,2015).

1.1 Zero Waste Fashion

Zero waste fashion design is a design technique that eliminates textile waste at the design stage. As a prominent researcher in the area of zero waste fashion design, Rissanen (2013) presents zero waste fashion design as a holistic approach between the fashion designer and

pattern cutter, which is endorsed in this research project. Where these two roles have traditionally been quite separate, zero waste fashion design requires new approaches where pattern cutting becomes an inherent part of the design-process. Zero waste fashion design in itself is not a new process, it originates from Ancient Greek and Roman eras. Some may argue its origin goes as far back as the caveman, where textiles were so valuable that it would be incomprehensible to cut any of it away and discard as waste. Certainly, the process of producing garments without waste can be traced back to a time when animal skins were draped on the body as clothing. With the introduction of woven cloth, early known examples of clothing were lengths of cloth used to create garments, such as the Indian sari and the Peplos, Chiton and Himation in Ancient Greece. As early as 2000BC woven lengths of cloth were draped and folded around the body (Burnham, 1973). The width of any cloth depends upon the loom and how looms have developed over time is a necessary consideration. "The Ionic chiton was nothing but an oblong piece of fabric whose dimensions varied with the countries that belonged to the same culture" (Rudofsky,1947). Rudofsky, criticises the gradual deterioration of clothes making as clothes, particularly in Western civilisation, became more fitted and required the use of patterns and curved shapes, which in turn creates fabric waste.

Figure 1. Marble Funerary statues of a maiden and a little girl wearing distinctive Ancient Greek dress – c.a. 320 BC. The Metropolitan Museum of Art

The Japanese kimono, one of the better-known garments for not wasting cloth, was made from cloth woven at a particular length and width, split into eight pieces, with no fabric waste produced (see figure 2). The narrow width of the fabric used in the kimono determines its horizontal dimensions' (Tarrant, 2016) and the fit is created by tying around the obi belt.

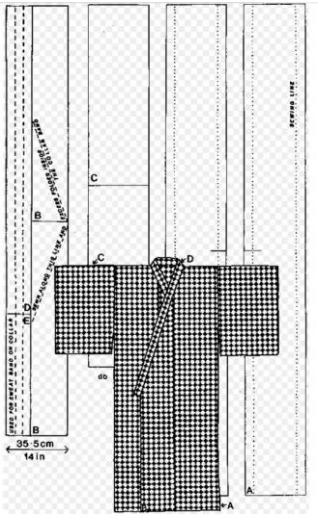

Figure 2 Kimono pattern showing the individual pieces of cloth woven to create the garment (Rissanen2016)

A sixteenth century man's shirt as seen in figure 3 was made primarily of squares and rectangles for the body and sleeves, and in the particular example, triangles were used tadd in extra ease. The pattern of the shirt showed little change until well into the nineteenth

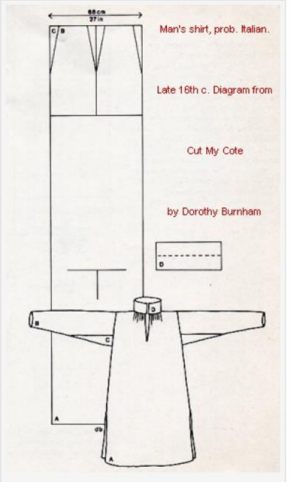

Figure 3. Sixteenth century man's shirt pattern constructed from a single cloth length (Burnham, 1973)

These garments were made at a time when raw materials were scarce and the process of producing textiles was slow. Fabrics were a luxury and as such were valuable and treated with care and respect.

> "Prior to the Industrial Revolution cloth was an expensive luxury and not easily obtainable. Therefore, fabric was carefully manipulated to use as much of it as possible, resulting in close to 100% usage" (Burnham, 1973)

Extra width for ease could be added in the form of inserted godets. A similar triangular shaped godet on this particular shirt was added to the underarm sleeve to give ease. This piece of fabric could easily be replaced when worn. The nature of the pattern produced no waste. The neckline, rather than a circular cut out, as traditionally expected, was a T-shape with any excess fabric folded in to provide a facing. No allocation for seam allowance was made on the pattern, giving a less precise form of construction compared to more traditional pattern cutting techniques. On this particular pattern, this would be particularly evident around the neckline.

This early literature concerns itself with the value of cloth, its beauty and craftsmanship, rather than the pressing issue of waste production. The eminent curator, Burnham describes various factors "affecting garment cut", the material from which the garment is made being the "factor that has the most influence on the particular shaping of it" and was probably one of the first researchers to highlight a link between "textile width, garment cut, and the resulting waste" (1973). The focus of her work highlights early origins of zero waste pattern cutting, more through lack of knowledge of sewing skills and then later through fabric appreciation and time spent producing materials of different widths on various looms. Vionnet is often quoted as the designer who laid much of the groundwork for zero waste fashion design of the twenty first century (Rissanen,2013). The one- piece approach to pattern and garment-making has historically been found in couture. Much of Vionnet's work was based around the bias cut, creating garments with as few seam lines as possible and creating fit with use of grain lines and manipulating fabric, rather than the traditional approach of designers using curved seams and darts. Vionnet's early inspiration came from studying Greek dress, particularly classical styles based on the shape of the rectangle.

1.2 Recent studies into zero waste fashion design

The term Zero Waste was first used publicly by chemist Paul Palmer who in 1974 created a company, Zero Waste systems (Zaman, 2015). He then went on to form the Zero Waste Institute to highlight the need for explicit design for reuse. Palmer established three basic forms of how humanity has dealt with the goods at their end of life, similarly explained in figure 4 below:

- First generation (Immediate satisfaction) - **DISCARDS AND DUMPS = GARBAGE**

- Second generation (Short term) - **POST-DISCARD REUSE = RECYCLING**
- Third generation (Long term) – **EXPLICIT DESIGN FOR REUSE = ZERO WASTE**

Figure 4. Three stages of product end of life. www.zerowasteinstitute.org

> *"Zero waste is a practical theory of how to wring maximum efficiency from the use of resources. It is third generation planning, where wasting is the first generation and recycling is the second" (Palmer,2001)*

It is a far more logical approach to efficient use than recycling, for example. Zero Waste states that the best way to avoid waste is to reuse everything over and over – perpetually. And that this can only be done if reuse is designed into all products right from the start, as highlighted in fig 5. It does no good to design ultimate discard into a product and then struggle after discarding to find some way to reuse the bare materials, as recycling does today. Design for zero waste considers the use of materials in their present form, without losing their capacity to be re-used once they come to their end of life (Zaman, 2015).

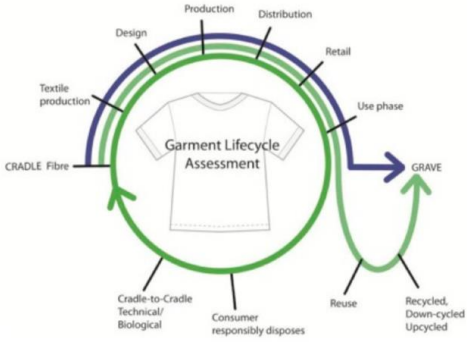

Figure 5. Garment Lifecycle Assessment" by Alice Payne, www.thinklifecycle.com

The study of zero waste fashion design has become of particular interest to creative pattern cutters and fashion designers who wish to design and create garments with reduced or no waste. Zero waste fashion design, post 2013, has quite often resulted in garments with unusual style lines and often with very little consideration to fit and form. As a commercial design approach, zero waste fashion design has so far had little impact and remains a niche approach due to the complexities of fabric width, garment fitting and also size grading (Fletcher,2014). Research on zero waste pattern cutting has tended to focus on the flat pattern cutting approach. Generally, garments produced in this manner have little fit and

form and where this does exist, it appears in quite casual construction, un-tailored to the body. Researchers into zero waste fashion design, Rissanen and McQuillan (2015) in particular, focus on the flat pattern cutting 'jigsaw' approach, designing patterns within the whole width of the fabric. The designs produced have "repositioned seams, exaggerated lines and a changed aesthetic" (Fletcher,2014), with construction techniques that fall beyond traditional garment manufacture capability. There is no mention in this early research of the end-of-life stage of these 'zero waste garments, questioning the Palmer theory of third generation 'zero waste' being described as third generation design for reuse (2001). It should be stated that as Rissanen suggests, "zero-waste fashion design is not 'good' in and of itself; it needs to be examined in a much broader context." (2013). New sustainable ways of approaching design within the fashion industry needs not only to include the design and production elements, but also garment life cycle and end of life.

Niinimaki (2013) discusses zero waste fashion as a sustainable design approach and its "capabilities and opportunities" for textile appreciation. Niinimaki uses both a theoretical and practice-based approach to zero waste fashion design to "demonstrate the potential" to change designers' attitude to garment design and production. "Self- made and unique textiles increase the value of the material and multiply its meaning to the fashion designer" (2013), a process which is crucial to the development of sustainable practices within the fashion industry. This appreciation of materials is almost forgotten in contemporary fashion, and reserves itself to slow fashion, produced in the smaller fashion design studio. Self-made and/or unique textiles increase the value of the material and multiply its meaning to the fashion designer. Artist and Designer Issey Miyake places "importance on the development of materials" for his clothing (Koike, 2016), recreating traditional natural materials, such as linen, silk or cotton, or developing new materials from advanced technologies (2016). Miyake's philosophy of A-POC, that "every piece of fabric begins with a single thread" allowing the designer to imagine the production of the material, and how much fabric needs to be produced, from the thread stage to the finished form, and how this can be achieved (2016).

Research into zero waste fashion design is most commonly associated with the work of Rissanen (2011-2016) and McQuillan (2011-2016), both of whom have identified the link needed between pattern cutters and fashion designers to produce garments with zero waste. These studies, although groundbreaking and thought provoking, have not, as yet, established a way of producing garments for the mainstream fashion industry. The emergence of fast fashion and the tragedy it has inflicted on human life and the environment, has resulted in a growing demand for more sustainable fashion-industry practices. One small part of this is a renewed interest from fashion designers and creative pattern cutters, in Zero Waste Fashion Design. Much of the previous research has been exploratory in nature, with fashion designers adopting approaches allowing them to produce

small niche collections. Further research is needed to enable mainstream industry to develop techniques for garment production with no waste.

According to Rissanen the separation between the roles of designer and pattern cutter, particularly in the mass production market, is the main challenge to addressing the issue of waste. At present “80% of garment environmental impact lies in the design stage” (Redress, 2018). To achieve a more holistic approach within the fashion industry, roles would need to move away from the traditional design to production process.

There are two main areas of waste within the fashion industry that concerns us;

1. Waste produced at the pre- consumer stage due to inefficiencies in pattern and garment width, including waste during the production of textiles in the form of fibres and inadequate quality of textiles.
2. Waste produced at the post-consumer stage in the form of used garments and household textiles.

Many researchers investigating zero waste pattern cutting have experimented with and utilised techniques such as draping with a piece of cloth or flat ‘jigsaw’ pattern cutting or a mixture of both. Townsend (2013) conducts practice-led research into how creative pattern cutting can develop the design process of patterns with zero fabric waste. The research highlights the importance of collaboration with textile manufacturers/designers, to develop the required textiles which “enhance the cut and drape of the garment”. A theory reiterated by Niinimaki (2013) whose previous research on zero waste fashion design incorporates not only the pattern cutter and fashion designer, but also the textile and material designer to inform the whole process from beginning-to-end. Townsend argues that “counting on one’s own experience of what looks right, what works together and just how far to push the fabric”, works in favour of applying rules and processes, habitually practiced (2013). A limitation of this study is the style of garment used to create the toile - a loose-fitting draped garment lacking commercial aesthetic. A question that needs to be asked is how the introduction of close fit can be developed through zero waste pattern cutting.

Carrico (2014) provides a discussion around previous research into zero waste fashion design and zero waste pattern cutting, by Holly McQuillan and Timo Rissanen, covering several ways of approaching the pattern making process. Carrico introduced a further experiment, using minimal seam and cut techniques, resulting in a simple garment form. The study provides a new and interesting development from a fashion design perspective, however further developments in the cutting processes would be useful to show how this technique could be used within the future fashion industry.

1.3 Circular Economy from a Design Perspective

This study used a designer – creative pattern cutter approach that considers garment lifecycle and environmental impact with some consideration of social impact, while producing a zero-waste collection of garments with the potential to become part of a circular design process. The circular economy principle sits on three essential criteria; designing out waste and pollution, keeping products and materials in use for as long as possible while still retaining their value and thirdly providing the opportunity to regenerate natural systems (MacArthur, 2014; MacArthur,2017). Products produced within a circular economy system are designed to eliminate any negative environmental impact as well as negative impact to human health through the use of hazardous substances in the production process, release of harmful gases from textile waste, and water pollution. The circular economy system requires products to be kept in the system for as long as possible, which requires the initial design process to take this into account through design for durability, design for reuse and design for disassembly to allow for more efficient recycling processes to come into play. Many researchers consider the circular economy to be a system which mirrors the role of nature and the need to keep the balance of the ecosystem by returning nutrients back to the soil. Looking at biological cycles with the circular economy system, problems occur when the materials used are a myriad of complex components which allows no room for extracting raw materials resulting in loss of value (MacArthur, 2014). . Supply chains which exist regionally and locally are the most attractive to a circular system, because of local supply of material production, product manufacture and use. Supply chain logistics can be organised with relatively low transport costs and without the import/export levies of crossing International borders. Opportunities for having some influence over retrieving products for further reuse, recycling and remanufacture become more possible (MacArthur, 2014). Within a circular economy system, necessary criteria to take into account would be

1. to introduce renewable bio-based materials, chemicals and energy sources.
2. to increase end-of-use recycling and energy recovery
3. to introduce sharing or pooling of resources, to make full use of assets throughout their useful life
4. to increase lifecycle through reuse and repair and remanufacture models (Lacy et al, 2020)

Until recently fashion designers have typically failed to consider end of use for the produce or material at the initial design stage. Fast fashion garments are made purely as a disposable item with no consideration for end of life. This planned obsolescence is a considerable challenge to cleaning up the impact of the fashion industry, highlighting the need for more circular design practices.

2.Method

Taking inspiration from early traditions of attaching emotional value to cloth, the aim of this research was to look at effective ways of producing a series of garments each with a single piece of cloth employing a no-cut policy to allow fabric re-use as required. To aid deconstruction of the garments at the end-of-life stage, a water dissolvable polyvinyl alcohol thread (PVA) was used in the construction process. As the research centres around sustainability and a circular process, natural un-dyed, untreated wool was used, also cellulose fabrics created in a closed loop system, alongside zips and embellishing thread made from recycled polyethylene terephthalate (PET). Where necessary in the design process a nonwoven material was cut to shape which has since initiated further research into fully -fashioning such smaller pattern pieces to eliminate the possibility of producing waste. The nonwoven textile used was a sustainable hessian, with British wool applied in a nonwoven process and naturally dyed. The benefit of this approach was to help understand how zero-waste pattern design could be taken further to create a 100% zero waste approach and to determine the factors needed to be explored for future fashion production.

An initial design sketch was made to refer to using a 2D-to-3D realisation process. Garments considered were a skirt, trousers, a jacket, and a coat. The whole width of the fabric was used and the length of fabric was estimated from the design sketch. The width of the fabric becomes a design feature and for the purpose of this experiment all fabric used was of the same width and had a selvedge which could easily be used within the design, adding to the aesthetic of the garment. This 'garment' was then developed further by draping on the female mannequin. The initial drape was developed in calico, a similar weight to the chosen final fabric. This method of drape is a tried and testing method of creative pattern cutting and one which allows the freedom to design directly onto the body form. This process was chosen for its experimental qualities and freedom to develop innovative techniques and patterns. Designing on the stand also gave the opportunity to focus on design aesthetic and quality of fit to the body.

The skirt was the most straight forward of the garments to drape from a single piece of cloth and a design which fit within the collection aesthetic was easily achieved. Some decisions were made during the process regarding the raw edge of the wool along the weft grain, where there was a possibility of light fraying. A bias trim was attached to prevent future fraying, however this in itself would create further problems with disassembly at the end-of-life stage. It was questioned whether it was more important to prevent fraying for future redesign, or to leave the fabric raw for future disassembly. Further research to establish this is ongoing.

Figure 6. Photo of skirt made from a single piece of cloth, full width.

The trousers were created from a width of cloth cut into 2 equal pieces down the warp grain. Although this created smaller pieces of cloth to work with for future designs, it did allow for the trousers to easily be created without further cutting. Pleats created the fit required around the waist and poppers and recycled zips were used for fastenings. The trousers had no crotch shaping and although this created no problems with the smaller ladies' sizes (8-12 UK sizes), this would restrict movement and comfort for larger sizes. The introduction of a fully-fashioned piece for the crotch is considered for further research.

Figure 7. Photo of trousers made from two half widths of cloth.

The jacket shown in Figure 6, was created from a width of fabric, pleated into the waist to create a fit. The difficulty with this garment was one width of cloth being too small for the whole jacket and two widths of fabric being too much. The introduction of a collar and rever to the jacket was difficult to achieve without cutting the cloth. Further experiments are ongoing to create an outcome to fulfil the concept of creating a garment from single pieces of cloth with no cutting. For this early collection, the garment was completed with an additional garment created from a cellulose based fabric, in a whole width.

The coat was made from a heavier weight version of the same cloth. This weight was too thick to create pleats and therefore darts were used to create shaping to the waist. The wool properties were such that these darts could then be moulded and shaped with steam to create a pleasing shape around the hips. The coat was eventually made from 3 widths of fabric, one for the sleeves and collar, one for the coat length from the waist and one width for the main body. On disassembly of the coat, the darts could be pressed out and the stitching did not mark the fabric in any way. As traditional with a fabric of this nature, a lining would be inserted; the research is again ongoing.

Figure. 8. Photo of coat made from full widths of heavier weight cloth.

3.Conclusion

A small range of garments were designed on the stand. The method is outlined in this article. The experimental processes described are the result of creating garments from a single piece of cloth with a no-cut policy to address textile waste from garment-making and consumption. This was complicated by attempting to create an element of fit within the garment which differs from current research in zero-waste fashion design. The purpose of this method was to allow for ease of deconstruction of the garment at its end of use, when the fabric could be used to make another garment. The design for disassembly allowed for the materials to be reused without future products losing value. The durability of the chosen fabric would keep the garment in useful life for as long as possible. The local production of the natural wool fabric as well as localised production of the garments would allow for greater possibilities for retrieving the garments for further reuse and/or repair. The trousers and skirts were easier to achieve from a single piece of full width cloth. The coat had to be made in three separate widths but still facilitated greater use of the fabrics on disassembly. There was very little fraying with this fabric, although this needs to be assessed as the garment is worn for longer periods.

The fabric for this design experiment was initially chosen for its quality and natural properties, but in the final creative design experiments, it proved to hold its drape, while still providing a structure to the garment. It was concluded at this stage that elements of fully-fashioned pattern pieces would be beneficial to the fit and aesthetic of future designs. It was also discovered that the use of water dissolvable thread was relatively unreliable as, while strong enough to hold the garments together under normal conditions, it would not be suitable for general garment construction. Further research into this circular design process is ongoing.

About the Authors:

Author 1 : Debbie Moorhouse is a Fashion Designer and Senior Lecturer in Fashion at the University of Huddersfield. Her research interests are in Sustainable Fashion and Circular Business models from a design perspective .

Author 2 : Tracy Diane Cassidy is a Reader in Fashion & Textiles. She obtained her PhD through the investigation of colour forecasting and is the author of a Textile Progress entitled *Colour Forecasting*. Tracy's research covers fashion/textile design, trends and marketing.

Author 3: Professor Parikshit Goswami (BSc (Tech), MSc, PhD, MRSC, ASDC, C Col, FTI, CText, CMgr, MCMI, FHEA), Professor Goswami is the Director of Technical Textiles Research Centre and is the Acting Head of Department of Fashion and Textiles at the University of Huddersfield. Research interests include Professor Goswami manages a large profile of research concerned with fibre/polymer science, nonwovens, medical textiles (implantable materials and non-implantable materials), sustainable materials (fundamentally understand the properties of new material), application and development of nano/submicron fibres for novel applications, and plasma treatment for functionalising textiles and textile chemistry.

Author 4: Dr A.D. Hewitt BSc MSc PhD PGCHE FHEA Technical Textiles Research Centre, Department of Fashion & Textiles. Dr.Hewitt's research mainly focuses on the development of innovative, commercially relevant textile products and processes, predominantly using nonwoven structures and technologies. Much of his research relates to engineering textiles for reduced environmental impact and the circular economy.

Acknowledgements: I would like to thank Professor Rina Arya for her kindness and support with this research paper.

Abstract | Nowadays resilience, beyond its relevance for economic studies, is becoming of fundamental importance in Design for sustainability, inclusion and social improvement. Around this term, the authors have developed and experimented a design strategy, tools and methods for sustainable and inclusive design researches and teaching, which are based on three concepts: Compatible, Aware and Equal. The approach is human centred with a mix of different applied methodologies that variates according to the context and the research purpose. Multidisciplinarity and Co-Design are constant, while tools like QFD have been redesigned and adapted to the new methodological requirements. In this paper, authors will discuss about their design strategy by analysing some experiences in various fields such as cultural heritage or Internet of Things for increasing awareness, sustainable lifestyle and intergenerational sociality. Three examples will be illustrated evaluating their result and impact on the society in terms of awareness, compatibility and equality.

KEYWORDS | RESILIENCE, SUSTAINABLE DESIGN, DESIGN RESEARCH, DESIGN METHODS, HUMAN-CENTERED DESIGN

1. Introduction

According to Bauman (Bauman, 2012), the world is losing its solidity day after day. Organizations are becoming more versatile, life forms more fluid, projects more flexible, and choices are becoming less rigid and, if possible, reversible. This (almost) fluid world emerges from the previous (almost) solid world of the XX century. In fact, in the last century, industrial societies were more stable and solid. The productive and organizational society was more solid as well as the connections between people and communities.

This solidity was mainly related to two reasons: the first reason was the poor-mobility of goods and people. In the XX century, people were economically “confined” to their land and their physical houses since traveling and moving were very expensive and only for very rich people. The second reason is linked to the limits of information transmission. Communications were slower for the language barriers and for the slower speed of the communication media. In addition, one layer of solidity was added by permanence over the time of social and cultural conventions. Such conventions in fact guaranteed a solid resistance to the mutation of local organizations. Nevertheless, the scenario of the world is different now. The global connectivity has gradually “melted” the solid structure of the old world. Consequently, the rigid social conventions have softened, the solid relationship between people has weakened and it has gradually established a world composed of light, variable, flexible and reversible organizations. This new world, colonized by a neoliberal economy and characterized by sudden changes, generates many problems such as lack of work for young people, social and economic inequalities and mass migration phenomena. This is also called “the fluid society” by Zygmunt Bauman.

A phenomenon that has increased the sense of precarity that characterizes the liquid society of Bauman can be considered the climate change, whose consequences are becoming more and more perceivable in Italy as well as in the rest of the world. In November 2019, Venice’s inestimable cultural heritage suffered huge damages due to the extraordinary height of the tide. Millions of euros were estimated as necessary to repair structures and to cover the missing income of tourism. The situation was so severe that the major of Venice declared a state of emergency. Considering the extraordinary magnitude of the event, the main culprit was climate change. (Henley & Giuffrida, 2020). Between the 26th and 30th of October 2018, several consecutive days of thunderstorms and very strong winds, called "Vaia storm" by meteorologists, caused considerable damage throughout the Triveneto area, affecting, alpine forests of the Dolomites.

Heavy rains and specifically the intense sirocco wind, reached an exceptional speed of 200 km per hour and felled 8.5 million cubic meters of timber. The figure was never recorded in Italy, on an area of 41 thousand hectares of land. Federforeste and Coldiretti have assumed that the total number of trees felled is 14 million. In the entire Triveneto area the estimated economic damage was 2.14 billion euros (Il Post, 2020).

But this is not just an Italian issue, it is a global problem. In December 2019, climate change was the main topic discussed during the UN Climate Change Conference. The conference was about the implementation guidelines of the Paris Agreement at COP 24 in Poland last year. The key objective of the conference was to complete several issues with respect to the full operationalization of the Paris Climate Change Agreement (UNFCCC, 2020). In this continuously changing context, Andrew Zolli and Ann Marie Healy (2012), propose the concept of Resilience as a key factor to overtake sudden, social and environmental alterations.

From the Latin verb “re-salio” which means “bounce back” the terms resilience is widely used in several fields. Within the Material science, Resilience is the ability of a material to absorb a shock without breaking (Accademia Della Crusca, 2020).; In Psychology, Resilience is the ability of the person to react positively to traumatic events (Treccani, 2020), while, in Ecology, Resilience is the ability of an ecosystem to return to its initial state, after a disturbance has occurred. The term “Resilience” has become of common use even in economic disciplines. This is probably due to the increasing frequency with which economic destabilization happens. Especially in Italy, there are everyday cities ruined by economic dislocations or companies which are bankrupt due to globalization and ecological transformations. Changes that alter the native secular lifestyles of small and big communities.

Resilience is becoming increasingly relevant in social awareness because it represents a viable reaction to today's constant mutations in this volatile global economy. Since it is clearly difficult to predict such sudden changes and consequently develop and provide instruments to strengthen societies defences, a strategy that could increase structural resilience of communities is required. Design disciplines are trying to participate in the definition of such a strategy through new approaches, focusing on methods that are not any more merely based on the humanization of technologic solutions. Since one of the main causes of the diminished resilience of society is its liquefaction, the reduction of stable connections, interactions and cooperation between individuals, families, groups, organizations and institutions, design disciplines are called to give answers in terms of projects able to redefine how services and institutions absorb unpredictable disturbances through participation, awareness, solidarity.

Developing resilience means developing skills such as agility, cooperation, connectivity, and variety to prevent crises, stress conditions, and to implement adaptive strategies quickly and efficiently. Our unit is operating in human-centred design research on topics regarding societal issues. We are developing and testing methodological tools and projects in the area of design for sustainability, inclusion and social improvement. Our strategy of intervention is based on three basic concepts: Compatible, Aware and Equal. Compatible: A design that considers the impact of its projects on people’s physical and mental health, trying to foster a lifestyle more compatible with human wellness. A design that aims to reduce the unsustainable impact of human behaviours on communities, society, environment and the

earth's ecosystem. Aware: A design that aims to increase human awareness about the consequences of people's daily choices on themselves, their society and the environment. A design that fosters connection, interaction and cooperation between individuals to increase their awareness and solidarity sense and belonging to communities and society. Equal: A design that aims to create equal opportunities for access to products, services, and systems for the benefit of the largest part of the population beyond physical, cultural, economic, social and any other kind of distinction. A design that aims to increase society's resilience through the empowerment of citizens, providing them new tools and methods for cooperation and participation.

In the following chapter we will expose three of our recent design research projects, different in terms of context, objectives and results but all united by a common strategy and methodology, based on the three concepts previously described. All the projects follow a mix of human centred methodological tools such as QFD, codesign, participative design that is adapted to every case study.

2. The INCEPTION project

Regarding accessibility to cultural heritage and, to the historic buildings – the discussion is often limited to architectural barriers. These constraints represent the traditional attitude of thinking about disability as a personal attribute which is characterized by a reduction of human physiological ability (for example a handicap that limits autonomy and mobility). However, cultural heritage is not only something physical and perceptible but sometimes it concerns also the intangible experience generated by history, art, and culture and associated with the built heritage. Moreover, although ability biases create effective solutions for individuals with similar abilities and circumstances, they exclude a much wider group of people.

As the World Health Organization (2011) reported, it is necessary to consider disability as a complex phenomenon, which regards the interaction between people's bodies and nowadays society features. In this term, it is possible to interrupt the idea of disability as a personal health condition and start to consider disability as a mismatched interaction between people and their own world (Holmes, 2018). From this perspective, these mismatches are more visible today due to technology complexity that produces exclusion to people who are not physically impaired. Therefore, the same mismatched interactions are presented to cultural heritage. As reported by the corresponding author (Mincolelli, 2012), the exclusion to the cultural heritage is produced not only by the building itself but mostly by lack of accessibility to its cultural information: the physical distance, the limited data accessibility, the communication tools inadequacy (due to technical and linguistic reasons) limit the experience of a common cultural heritage to a great part of the European citizens. Regarding nowadays technology, although many potential solutions are available to facilitate access to cultural information, there are several factors that limit digitalization and Cultural

heritage inclusiveness such as resource limitation, the lack of standards and big data management issues.

The first research case was developed to tackle the aforementioned problems. Inception is a multidisciplinary research project coordinated by the Department of Architecture of the University of Ferrara and financed by the European program, Horizon 2020. Its purpose is to enable and promote inclusiveness and accessibility of the European cultural heritage through Information and Communication Technology (ICT), which can increase knowledge, enhancement, and dissemination of its cultural asset and value through the Web (Di Giulio, Maietti & Piaia, 2016). The project followed a Human-Centred approach and Co-Design was used to develop the platform in collaboration with the main stakeholders and users. They not only co-designed the platform, but they also actively participated throughout the entire design process.

In particular, INCEPTION developed an open-standard Semantic Web platform for sharing 3D HBIM models (Building Information Models for Cultural Heritage) to be implemented in user-friendly Augmented or Virtual Reality operable on different digital devices. This specific configuration can catalogue every cultural heritage artefact data (including also context data), which can be subsequently communicated to a wide audience. The aim of this configuration is to make cultural information freely accessible to all (Pauwels, Bod, Di Mascio, & De Meyer, 2013).

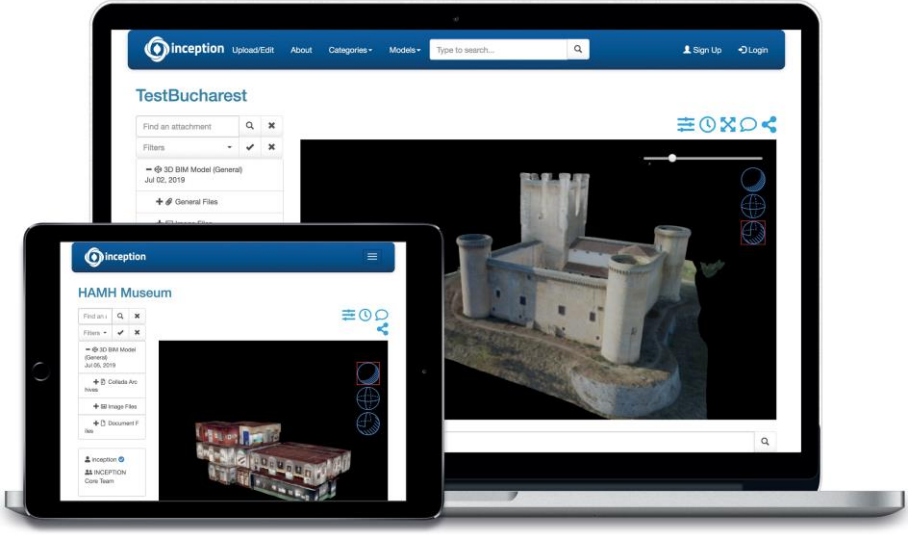

Figure 1. Representation of the beta version of the INCEPTION web platform, which is accessible on different digital devices. In particular, two 3D examples of HBIM models.

Considering these characteristics, the project can be firmly considered resilient under all of the three concepts described in this paper. INCEPTION is intangible and compatible due to its digital nature. Digital technology accelerates the migration from the physical property of a given product to the bits of a virtual experience or service (Anderson, 2009). The physical dematerialization makes INCEPTION accessible and on-demand to all, decentralizing at the same time its system through a ubiquitous communication generated by the Web (Kelly, 2016). Furthermore, this process makes accessibility to cultural heritage easier and stronger. In fact, the 3D model properties can be elaborated and processed without running the risk of distorting the original configuration of the historic buildings.

Digitalization makes INCEPTION also equal because the platform is designed to be accessible and open source to all. In fact, a versatile service adapts itself to the numerous people categories, from the expert necessities to the common citizen's needs. Linguistic or cognitive barriers – in terms of perception, navigation or cognition of virtual information (Thatcher et al., 2006) – can be overtaken by the User-Centred Design approach because it allows finding inclusive solutions that accommodate those needs, capabilities, and ways of behaving (Norman, 2014).

Finally, INCEPTION is also aware because is participative starting from its development. Digital media, indeed, are able to support people's cultural actions (Manovich, 2013), such as accessing and elaborating knowledge; sharing or remixing information; engaging in interactive cultural experiences to visualize digital contents. Regarding inception, those operations can be performed by people directly on the INCEPTION platform. The cultural heritage is available for all European citizens in an interoperable way, in which people can interact or work with the HBIM models in different levels of details: download or upload its files, gain or enrich the information of every 3D source, or simply explore it corresponding documentations. Moreover, since every digital model maintains all the technical and historical information of its corresponding building, INCEPTION acts as a huge digital archive for the safeguard, for the restoration, and the reconstruction of every built heritage. This including the last extreme case of the fire-damaged Notre Dame cathedral in Paris (Agency Research Executive, 2019). For this reason, all the interactions with the platform are capable to increase people's personal knowledge about the European cultural identity on people (Maietti et al., 2017), stimulating them to be more participative and active in preserving it over the time.

2. The HABITAT project

Another project carried out by the research team was the project HABITAT (Home Assistance Basata sull'Internet of Things per l'Autonomia di Tutti): the project was financed within the POR FESR 2014-2020 program of the Emilia Romagna Region in Italy, which started in April 2016 and ended in July 2018. The multidisciplinary team that developed the project was composed by the by the CIRI-ICT group (Centre for Industrial Research of the University of

Bologna which specializes in radio frequency systems) who was the leading partner in the research; CIRI-SDV (Life Sciences and Health Technologies of the University of Bologna who are experts for the technical validation of inertial sensors.

Figure 2. The Habitat project prototype and test with elderly users.

The HABITAT project aims to develop and test a platform based on the Internet of Things for the realization of adaptive and supportive living environments. The members of the research team developing the part of the project related to Design Research decided to apply a design methodology that could ensure a high level of usability, accessibility, and inclusiveness (Mincolelli et al., 2019). The final choice was the application of the User-Centred Design approach, also known as UCD (International Organization for Standardization, 2010), the reason of that option was linked to the main objective of the project itself: the development and testing of a platform composed by smart objects with a TRL - Technology Readiness Level (Mai, 2017) of 5 (that means that the prototypes were expected to be tested in a natural environment and not in a laboratory; the starting point of the technologies used for the project was a TRL of 3rd grade, also known as proof of concept) and, at the same time, the integration between technological aspects and human factors.

The chosen approach, which is characterized by a multi-level problem-solving process, allowed the research team to analyse and predict how the user would interact with the final products, and also to verify and validate the research contents and the design development (Mincolelli, 2008). Given the specificity and the peculiarities of the different users involved in

the project, it was important to set up a research methodology that would allow the optimization of the characteristics of the domestic ecosystem by developing an open, flexible and customizable platform that could change its behaviour according to the needs of the individual person (Mincolelli, Marchi & Imbesi, 2017).

The HABITAT project consisted in designing, prototyping and testing a home ecosystem composed of objects with natural interfaces but equipped with sensors governed by Artificial Intelligence, able to improve the user's self-sufficiency and capable of facilitating an active ageing for older people, without forcing them to face the difficulties related to the learning of new interfaces and communication systems using the Internet of Things. Those daily objects were supposed to ensure a high level of usability, ergonomics, and inclusion through the creation of customized profiles based on the analysis of the needs of each individual person (Imbesi & Mincolelli, 2020). The system also allowed to catch, elaborate and monitor a series of data for the analysis of the quality of ageing, in the short, medium and long term.

The HABITAT project can be defined as "compatible" because it tries to analyse how daily activities of the users can be modified, in order to consent healthy ageing for them that can directly and indirectly positively impact to other people and to the whole society. It was "aware" because it allowed primary users, secondary users and stakeholders to understand how the elderly's quality of life can have significant consequences on the community and on the environment. Lastly, it was "equal" for its inclusivity that aims to give the same opportunities and the same level of usability and accessibility for products, services, and systems to the largest number of users, including the ones belonging to niche categories needing special requirements.

3. The PLEINAIR project

The team is carrying out another research regarding the PLEINAIR project. The project started in July 2019, will last 2 years and is funded under the action 1.2.2 POR FESR 2014-2020 of the Emilia Romagna Region. One of the problems (Ministero della Salute, 2017) the world population is facing is the sedentary lifestyle; this aspect has negative and concrete consequences on multigenerational users: from children to the elderly. At the international level, it is estimated that one adult in four (aged between 18 and 69) and three out of four teenagers (aged between 11 and 17) do not do any type of physical activity or exercise, as recommended by the WHO. In Europe, according to the WHO, the sedentary lifestyle causes every year one million deaths (about 10% of the total).

The project team has identified one of the possible solutions to reverse this constant and dangerous drift: sharing and realizing better lifestyles to improve people's quality of life, social and recreational activities for greater physical activity. These are the reasons why the INCEPTION project has been developed: Free and Inclusive Parks in Networks for Recreational and Physical Intergenerational Activity.

Figure 3. System general layout of the PLEINAIR project

Usually one of the weaknesses of the existing playgrounds is the one of being very sectorial; Such playgrounds meet only the needs of specific users. There are beautiful playgrounds for children, modern skate parks for teenagers or life paths for the elderly but, it is difficult to see a park that simultaneously targets multi-generational users. Parks where the child can play, collaborate and deal with different users, such as the elderly and adults. Even if in different contexts, there are already best practices (International Child Development Initiatives, 2012) that prove how sharing heterogeneous activities by different users can widely benefit all the users involved.

PLEINAIR is made up of a highly specialized scientific-industrial research team: the partners TekneHub and A.I.A.S.have cultural and methodological skills aimed at the Human-Centered Design approaches. DataRiver, CIRI SDV and Future Technology Lab have proven competencies in the sector of IoT/IoMT, sensors, as well as data management, Machine

Learning/Artificial Intelligence. The industrial partners – that are important for their skills in terms of industrial and experimental operation – are Ergotek s.r.l. (wooden seats and furniture), Sarba s.p.a (playground equipment and urban furniture), mHealth Technologies S.r.l (healthcare furniture sector). The main goal is to create playgrounds and inclusive contexts in order to carry out outdoor socio-recreational activities. A context that can adapt to the needs and necessities of each person, personalizing the interface with targeted motivational strategies. To achieve this objective, the team plans to develop and create the Outdoor Smart Objects (OSOs): auxiliary objects or ludic tools equipped with actuators and sensors that detect important parameters for a correct and healthy lifestyle. The network of possible solutions is wide and open, as the adaptation through the auxiliary objects will occur thanks to the development of distributed artificial intelligence within the OSOs.

The project is ongoing and follows design research approaches and methodologies aimed at satisfying people's needs. Users (understood in the broadest sense) have been and will be constantly and frequently involved in the research. During participatory working days, tools such as the co-design will be applied in order to plan and design together with the users. Therefore, the project is permeated by the concept of resilience.

PLEINAIR is definitely a Compatible and Equal research project: the signals that gave birth to and think about the project are closely linked to concepts concerning people's health and lifestyle; improving the – physical, social and inclusive – the quality of the surrounding environment in order to raise people's quality of life. The objective of PLEINAIR is the development of OSOs that allow creating inclusive contexts in which people of different ages, skills, cultures, sensitivity, and abilities can carry out recreational-social activities together, without physical, cognitive or social barriers.

The research is certainly Aware: one of the strengths of the constant and systematic use of Human-Centred Design methodologies (such as the co-design) is to trigger an emotional bond with people from the first phases of the research; thanks to this "trigger" it is credible to be able to make people more aware of both their needs and the shortcomings (or not) of the surrounding environment. One of the most significant problems we are experiencing, especially within Public Administrations, is the one regarding the management and maintenance of the park. Being able to design a context together with the people belonging to the neighbourhood community where the park is located, can create inclusive and virtuous dynamics for its good maintenance. Involving people and making them active actors within the strategic choices for the realization of a park, crucially increases their responsibility on the context conceived all together.

4. Conclusion

Within the context of climate change and fluid society, the impact of our approach in design research is aiming to improve every day's life quality in terms of awareness, compatibility, and equity. To clarify the connection between the projects INCEPTION, HABITAT, PLEINAIR

and the resilience in terms of equity, awareness, and compatibility the Table 1 has been done.

Table 1. Conclusive Table with relationships between projects presented and the concepts of equity, awareness and Compatibility.

	INCEPTION	**HABITAT**	**PLEINAIR**
Equity	Accessible to all, remove linguistic barriers by means of HCD.	Does not leave behind fragile categories but encourage social and inter-generational inclusion	The project aims to create recreational-social activities together, without physical, cognitive or social barriers.
Awareness	Promotes awareness of the territorial identity	Promote awareness of elderly's life quality and the impact on the society among primary, secondary users and stakeholders.	Human-Centred Design methodologies (such as the co-design) trigger an emotional bond with people and stakeholders involved.
Compatibility	Digital and intangible	Promote healthy ageing for a positive impact on society	Improve the quality of the surrounding environment

Projects such as INCEPTION, HABITAT, PLEINAIR are intended to foster a resilient culture that helps to preserve the territories' integrity and society's sustainability and empower citizens through their communities and pass this empowerment on to future generations. Each project enhances a resilient culture on a different level: HABITAT promotes a resilient, inclusive society that does not leave behind fragile categories such as the elderly, but rather encourages them to be active and autonomous within their limits and taking advantage of a dignified and sustainable help provided by the society they belong to. PLEINAIR is instead focused not only on fostering a healthy and active lifestyle of individuals, but also on encouraging dialogue and closeness between different generational groups, increasing connections and interactions between citizens of different ages. Finally, INCEPTION not only represents a participatory strategic tool to create a crowd-based backup of data useful in an emergency (as in the case of the fire of Notre Dame in Paris) but it also promotes awareness and understanding of the territorial identity.

Dive deep into the design research and into the human-centred design, the resilient approach is not only useful to improve everyday life but also to promote a sustainable progress of the society. Promoting equity, awareness, and compatibility not only can contribute to grant a sustainable development of human society through the design of products, services and institutions, but also by encouraging individuals to consider and adopt

behaviours that empower their community. Design research for promoting resilient culture can represent an alternative perspective, a counterbalance to the diffusive consumeristic and individualistic mindset that can be considered the greatest danger for an equitable and united society.

About the Authors:

Giuseppe Mincolelli is an architect and designer, specialized in HCD and Inclusive Design. He is Associate Professor of Design at the University of Ferrara, to which he is coordinator of the M.Sc. in Innovation Design. Numerous patents, publications and awards in Italy and abroad.

Gian Andrea Giacobone is a product-interaction designer and Ph.D. specialized in HCD methodologies, HCI, HMI, UX, UI and Internet of Things. He is now a research fellow and lecturer at the M.Sc. in Innovation Design at the University of Ferrara.

Silvia Imbesi is an Architect and Designer. She works in the inclusive design field as freelance designer. Now she is a Ph.D. candidate at the Department of Architecture of Ferrara, carrying out a research on Inclusive Design for the elderly.

Michele Marchi is an architect and Ph.D., graduated at the University of Ferrara. He is author of articles, speaker at national and international conferences and consultant for public and private associations on issues regarding physical accessibility, cognitive and sensory.

Filippo Petrocchi is a product designer and Ph.D Candidate of Design at the University of Ferrara. He conducts his research field on inclusive and sustainable design with a special focus on automotive and elderly people.

Circle Sector: exploring the role of designers in a circular economy

Ben Hagenaars[a], Niels Hendriks[a]

[a]Luca School of Arts campus C-mine Genk (BE)

ben.hagenaars@luca-arts.be, niels.hendriks@luca-arts.be

Abstract |In this paper we research the role of the designer in the framework of a circular economy. We explore what methods, attitudes and strategies designers deploy to facilitate the transition from a linear towards a circular economy in and around the city of Genk, Belgium. First we elaborate on the context of Genk. We continue by questioning our role as designers in this context by elaborating on the Circle Sector project. An archive, lab and studio that maps, experiments and prototypes with locally available materials. We will explain our method of mapping, experimenting and prototyping with these materials. We conclude our research by highlighting our role in the framework of a circular economy.

KEYWORDS | CIRCULAR, ECONOMY, DESIGN, ROLE, CULTURE

1. Introduction

The city of Genk as a laboratory for circular economy

Circle Sector started as a project in 2018 to research the role of designers in the framework of a circular economy. Our research and design work is situated in the city of Genk, Belgium. Genk is a former coal mining region that, after the closure of the coal mines in the 80s, is focused on industrial manufacturing often linked to the car industry. However since the closing of Ford Genk in 2014 the city of Genk, its residents and local companies are trying to reimagine their role in a post-industrial city. Many of Genks's residents have skills in the manufacturing industry but are left without an employer as most industrial manufacturing has moved away. The policy makers of Genk look towards design and innovation to generate new opportunities for industrial activities and local employment. One of the potential paths to explore deals with activities within a circular economy. In 2015 the city of Genk published a paper titled; "Genk as a laboratory for circular economy" (2015). One of the triggers for setting up the Circle Sector lab, archive and studio at our design and research campus located in the city of Genk.

Circular economy: Challenges and opportunities for design

Circular economy holds a vision of a future where material flows mimic biological cycles. To turn this vision into a reality the linear system of taking, making and disposing resources needs to be transformed into a circular one (Macarthur, 2013). Hawken (1999) highlights the potential designers have to impact the system since up to 90% of the environmental impact of products is determined during the design stage. Which stresses that designers have an important role to play in the transition from a linear towards a circular economy. Preston (2012) argues product designers can play a key role in the transition from linear to circular if they embrace circular design strategies such as reuse, repair, remanufacturing and recycling. These strategies have been popularized by Braungart and Mcdonough (2002) as Cradle-to-Cradle design. Cradle-to-Cradle focusses on overcoming the technological barriers to facilitate the transition towards a circular economy. They have resulted in many technological innovations that follow the principles of circularity. But the linear system of taking, making and disposing continues to produce a lot of waste. Although the technical focus is fundamental to make the circular economy a reality they are not the only barriers to overcome. Kirchherr (2018) reports that cultural barriers such as changing company culture and consumer awareness, have the largest impact in slowing down the transition from linear to circular.

A fundamental reorientation of the business models on which the linear economy is based need to be transformed to facilitate a transition towards a circular economy. This creates uncertainty about the future and results in resistance to change in industry and policy. The linear economy not only represents a system it also represents a culture where citizens embrace the role of passive consumers, companies make and sell products without taking their environmental impact into account, policymakers support the linear system rather than questioning it and designers often create more troubles than solving them. Rittel (1977)

described this complexity as a 'wicked' design problem that involves social, economic, political, cultural and environmental challenges. If designers want to facilitate the transition from linear to circular they need appropriate strategies that go beyond technological problem solving.

Dan Hill (2012) describes social, economic, political, cultural and environmental barriers as the dark matter of design. The culture context, business model or vision of the future in which products, services or systems are designed. Similar to dark matter the culture of an organization or vision is hard to perceive, yet it shapes the physical properties of the designs it produces. Imagine a car, it is clearly defined by its material properties. However the vision of the car company on the future of mobility, its business model, the relationships with its customers, … are part of the dark matter that shapes the car. Hill (2012) argues that dealing with the dark matter of design requires a strategic design approach. One that encompasses both the questions and the solutions of design problems which challenges the problem solving role designers play.

2. From Problem solvers to trouble makers

What role can designers play in facilitating a transition from a linear towards a circular economy?

Designers often take on the role of problem solver who proposes solutions in the form of drawings and prototypes for a given problem framed by a client (Cross, 2000). Yet, designed solutions like single used packaging can cause more troubles than they solve. They help a client deliver and sell its product to a consumer. The designers of the packaging can consider circularity by choosing mono materials that can easily be recycled. Problem solved from the perspective of the client. But these single use packages also create new problems. In theory recyclable packaging can circulate in many loops. In practice they end up in water streams, break down into microplastics and cause harm to the global ecosystem. Although the intentions of the designer and client might be good by proposing a recyclable packaging material, their design decision still can cause harm in unforeseen ways.

Tony Fry (1999) argues that good intentions are not enough, designers need to learn how to operate in an increasingly complex society by exploring the future consequences of design decisions. We encounter this critical attitude in speculative design. Where possible futures are explored through design. Speculative designers like Dunne and Raby (2007) start with posing questions; what future is possible, plausible, probable or preferable? The speculative strategy also considers things in its larger context, the cultural environment in which product, services or systems are used. Speculative design borrows strategies from 'future studies' but combines it with the tactile nature of design. Victor Margolin (2007, p.4) points out that designers have the unique ability to make future situations tangible. By designing prototypes that enable the "staging" of future use situations in a physical space. Ilstedt and Wangel (2013) argue that prototyping enables to reveal the dilemmas and opportunities in a design space.

To facilitate the transition from a linear towards a circular economy designers need to learn to address the dark matter of design. Shaping the cultural context in which products, services and systems are used. This requires a critical attitude where design is used to generate a dialogue about what circular future is possible, probable and preferable. John Thackara (2005) argues that facilitating a transition requires an on-going and collaborative effort of people with various backgrounds. Creating an environment where stakeholders with different backgrounds and expertise can collaborate is the ambition of the Circle Sector project. The goal is to make circular futures tangible in order to explore and evaluate their potential.

3. Circle Sector approach

The scale of the linear economy poses a challenge for creating a collaborative environment. The linear economy is spread out across the world which creates a lot of physical but also cultural distance between the people who design, produce and use products. The physical distance impacts the environmental footprint of the product. The cultural distance makes it very complex to facilitate a constructive dialogue between the people who design, make and use things.

In contrast to the globalized linear model, Circle Sector is organized on a regional scale to establish an ecosystem of designers, producers, policy makers and citizens. The goal is to draw together new relationships between these actors and set-up decentralized production chains with a minimal environmental impact.

Our approach to achieve this goal is threefold; mapping, prototyping and testing. We start by mapping locally available resources. Materials and expertise that can be found in and around the city of Genk. We organise labs that are integrated into the curriculum of the productdesign department of campus C-mine in Genk. In the labs the design researchers and students experiment with local available resources. In the Circle Sector studio, we transform our design experiments into prototypes of circular products, services and systems. The prototypes act as props that represent a possible future of a circular economy. They can be used to experience and evaluate the potential impact of the circular economy. Mapping, experimenting and prototyping is an iterative process that involves local companies, policy makers, experts, citizens around the campus C-mine of the LUCA School Of Arts in Genk.

3.1 Mapping

Our process starts with mapping materials that can be found in and around the city of Genk. Like a chef who challenges himself to only work with local ingredients we start by looking for locally available resources that we can use for designing circular products, services or systems. The mapping process follows a bottom up and qualitative approach. By visiting local industries, interviewing the employees and translating that documentation into a narrative we aim to tell stories about opportunities and challenges of available resources.

One of our mapping exercises focused on a plastic recycling system within the region. Single use packaging is sorted by citizens, collected by waste management services and processed by a local recycling firm. The plastic waste is a mix of various plastics that are transformed into a granulate. The granulate is melted to make public furniture like picnic benches. It is promoted as an example of circular economy. However, the recycling process also has its limitations. When different types of plastics are mixed, the quality of the material downgrades. The colour palette of the recycled granulate is limited to different shades of grey. The volume of single use plastics is growing exponentially resulting in an overstock of recycled plastic granulate. Should we design more solutions using the recycled plastics or question the way we use and perceive them? Plastic as a material is quite sustainable; it lasts for several hundred years and can be remelted to make new products. But we use it in an unsustainable way for single purpose products like packaging. The relationship between material properties and how we use them needs to be considered when designing new systems for circular economy. These insights provided the base for the CS Lab 'plastic systems'. Where our design students explored alternatives to recycling plastics.

A challenge in drawing together new relationships on a regional scale is creating an inspiring storyline that includes the perspective of the participating partners. We are still learning appropriate storytelling strategies from journalists, photographers and video makers. But we see this a crucial skill to make new connections between industry, policy and citizens. Stories can be documented and shared. Important qualities in generating a collaborative culture around circular economy.

Figure 1. Recycled plastic benches by Eco-Oh!

3.2 Experimenting

The next step in the Circle Sector proces is experimenting with materials from the Circle Sector archive to unlock their potential. To do this, we organise labs together with industry around specific topics like colour, plastic, algae, …. In each lab we try to involve expertise from industry, science and policy. Together with the parters a state of the art design challenge is formulated.

Recently we organised the Circle Sector Colour Lab where we experimented with coloring processes based on agriculture waste streams. The agricultural region around (City name) is focused on fruit production. About 20% of the apples and pears are labeled unfit for consumption. During the lab we extracted pigments from the fruit and used them to dye natural textiles. The experiments we conducted propose an alternative to the chemical colouring processes of the textile industry. The experiments provide an opportunity to open up a dialogue about colour processes in the textile industry. We facilitated the dialogue by organising an exhibition around the colour lab topic. This also provides the students that participated in the lab a platform to share their experiments. One of the issues raised is the stability of the colour. The biological colouring processes can't 'fix' colours, so they degrade when they are used and washed. This is seen as a problem form industrial textile production. Based on the results of the Colour lab we argue that degrading of colour over time could also be seen as a quality.

The Circle Sector labs aims to highlight the possibilities of locally available resources. By presenting them in a different context to the public, industry and policy it creates new opportunities for collaboration.

Figure 2. T-shirt made from bio cotton dyed with pigments made from food waste. Design by Karel Op t Eynde, picture by Anke Van Asbroeck.

3.3 Prototyping

The experiments created in the lab create opportunities for setting up new pilot projects. Custom Territory is such a project that originated in the Circle sector Lab. It is an ongoing research project focused on reimagining fixed roles within the sneaker industry; designers, producers and consumers. With the support of a design researcher and art director the project evolved into a research and design project in collaboration with a local shoe production company Ambiorix and fashion incubator MOOI.

Custom Territory is a collective of shoemakers, designers and wearers that aims to decentralize the global sneaker industry into local territories where boundaries between designing, making and wearing can blur. In collaboration with local actors CUSTOM TERRITORY transforms locally available resources into custom creations to generate a contextual design language. Each territory represents a different city and develops into its own aesthetic. Through this process Custom Territory draws Retake-Remake-Reuse patterns that reconnects materials, expertise and infrastructure.

Custom Territory proposes a decentralized production model for the shoe industry that is focused on repairing resources rather than then turning them into waste. It aims to be the first step in facilitating a transition from a linear towards a circular sneaker industry by showing how it could work.

Figure 3. Custom Territory prototype made from local available resources. Picture by Laurens Thys.

4. Discussion

We framed our research in the following question; What role can designers play in facilitating a transition from a linear towards a circular economy? We differentiate ourselves from the problem solving perspective (Cross, 2000) by embracing a critical attitude (Dunne & Raby, 2007). We argue that our added value is that we can make circular futures tangible (Margolin, 2007) in order to assess together with local stakeholders if they are possible, plausible, probable or preferable.

Adopting a critical attitude by posing questions rather than proposing solutions

The mapping exercises helped to make available resources visible, connect them and understand the system of which they are a part. They also made it possible to explore the challenges and opportunities of using local resources in a specific area. Our mapping exercise of the plastic recycling industry revealed several challenges; such as the limitations of the recycling industry. The mapping strategy requires a critical attitude, like an investigative journalist who researches the complexity of a specific issue. Storytelling is important to share the story of a specific issue.

Drawing together new relationships between industry, policy and citizens

By experimenting with locally available resources and documenting experiments the potential of a local circular economy can be made tangible. In the CS Colour Lab where we extracted colour pigments from fruit waste and applied them to textiles it brought together an agricultural sector with the textile industry. The experiments developed by our design students made that connection tangible. Although they are by no means ready for industrial production they do open up a new conversation between partners that never talk to one another. These results were also exhibited to spark a dialogue with the public about the potential of biologic colouring processes. Drawing together relationships requires designers to zoom in and out between a system perspective and hands on experimentation.

Making possible futures tangible to explore their potential

We argued that making the vision of a circular economy tangible is crucial to facilitate the transition towards it. We applied this in our Custom Territory project. In this project we developed a workshop format which provided participants a temporary stage where participants can explore and practice their role in a circular system. Custom Territory has been shown at several cultural institutions and events. It helped to open a dialogue with several actors about the potential of a distributed production system for the shoe industry. However the true challenge of this and other projects is to move beyond the prototype and integrate it within the industry. The prototype is the first step. We now have to develop new strategies to test the Custom Territory ideas in an industrial and commercial context.

Future Challenge: how to make the Circle Sector project sustainable?

Circle Sector started as a project in 2018, it is too soon to evaluate if it contributed to a cultural change in the city of Genk. Our biggest accomplishment so far is the integration of the Circle Sector in the culture of our own organization. Circle Sector is now part of our design curriculum and research agenda. Circle Sector creates a context where design students can explore their role in a circular economy together with local partners. To ensure the continuation of the Circle Sector project we have to overcome several challenges. We have to look for funding from both industry and policy, Without losing our critical position between industry, policy and society. This will require other strategies that help to integrate the principles of the circular economy in the culture of an organization, a political agenda or business model of a company.

5. Conclusion

Besides overcoming technical barriers, a transition from a linear towards circular economy requires a cultural shift in the role designers, policy makers, citizens and industry leaders play. If designers want to facilitate this transition they need appropriate design strategies that move beyond the problem solving perspective. In the context of the Circle Sector project we explored mapping, experimentation and prototyping strategies. We suggest that designers; adopt a critical attitude by posing questions rather than proposing solutions, learn how to draw together new relationships between industry, policy and citizens and develop skills to make possible futures tangible with the goal of exploring their potential together with local actors. These strategies help to discuss and experience the potential of a circular economy. Strategies for embedding the principles of a circular economy in the culture of an organization, a political agenda or business model of a company still need to be explored.

Cooperatives enterprise, incubators for the co-design of a new organizational and management model for sustainable development.

Caterina Rosini*[a], Silvia Barbero[a],
[a]Politecnico di Torino
*caterina.rosini@polito.it

Abstract | In the global economic context, cooperative enterprises have a considerable impact, with approximately one billion people worldwide estimated to be members of cooperatives (ICA e International Cooperative Alliance, 2015). In the historical evolution of the cooperative enterprise, they were born progressively, different typologies according to the most emerging collective problems (Depedri & Turri, 2015). However, the profound changes in the socio-economic context have expanded the emerging social needs, resulting in greater complexity that has challenged the established resilience of cooperatives. This complexity has led to the creation of a study based on the approach of Systemic Design (SD). Thanks to the primary tool of SD, the Holistic Diagnosis (HD), is possible to determine the current scenario and its complexity. The first phase of analysis of the context of reference is viewed from multiple points of view, such as economy, society, demography, and culture to identify strengths. With this background, the aim of this study is to define the first basis to design a new organizational model for social cooperatives, in the Italian context, to face the actual fluid situation. Specifically, the study highlights the cooperatives hidden potentialities to improve the structure of the organization and provide effective answers within the economic context. The HD is the first step to develop new organizational model for cooperative enterprises to be replicated on similar business models. To reach this goal a literature review is settle to highlight the actual gaps and a case study is analyzed in depth in order to obtain original data and validate the first hypothesis.

KEYWORDS | SOCIAL COOPERATIVES, HOLISTIC ANALYSIS, ALTERNATIVE APPROACHES, SYSTEMIC DESIGN

Introduction

In Europe, the term social enterprise refers to those enterprises defined as organisations whose mission is to produce goods and services to meet the needs of local communities, social groups and people, sometimes in fragile conditions. In every European region, these enterprises have different definitions and frameworks, some studies have investigated the birth and development of this type of enterprise (Borzaga & Santuari, 1999; Barr, 1992). However, the main reasons behind the birth of social enterprises can be identified in:

- market crises due to the lack of homogeneity of information between producers and consumers; social enterprises offer an alternative to government-led interventions by creating a more socially embedded, equitable economy (Ridley-Duff & Bull, 2015).
- inability of the welfare state to meet the needs of public services; social enterprises sell or offer social services, programs, and/or products to fulfil human needs, by addressing the social problems that humans face (Rasheda, 2019).
- Individuals and/or groups of people who take actions to meet their ethical, ideological or religious aims (Hansmann, 1980; Weisbrod-,1975; Costa,2012).

The distinction between social enterprise and social cooperative has been the subject of different studies (Defourny, Nyssens & Brolis 2018; Linzalone, 2013; Chell, Nicolopoulou & Karataş-Özkan, 2010). The International Cooperative Alliance (ICA), whose task is to promote and strengthen autonomous cooperatives around the world, has come up against the difficulty of defining uniquely the form of the cooperative so as to reconcile all experiences on a global level (Vella, 2010).The first univocal definition was profiled at the 1996 Manchester Congress with the following description: "an autonomous association of people who come together voluntarily to meet their economic, social and cultural needs and aspirations through the creation of a jointly owned, democratically controlled enterprise". At the legislative level, cooperatives have been officially recognized in the European Union by Article 48 of the *Trattato di Roma*, which defined them as a specific type of "company". From this moment on, each member state has designed regulatory frameworks to protect the interests of members and third parties.

Among all the member states, Italy was the first to create *ad hoc* legislation to regulate this type of enterprise (Kerlin, 2006). With the law n.381/1991 art.7, the Italian normative defined social cooperatives as non-profit entities subject to an advantageous tax regime with the aim of "pursuing the general interest of the community to the human promotion and social integration of citizens". More in detail, Law 381/1991 distinguishes three types of social cooperatives: 1) Type A social cooperatives dealing with the management of social and health services, education, and cultural activities; 2) type B social cooperatives, which have the objective of introducing "disadvantaged individuals" into the world of work (at least the 30% of the cooperative's workers); 3) Type C social cooperatives represent a category made up of consortia of social cooperatives. The consortia may have different characteristics, of mutuality, territorial, cross-sector and experimentation for activities in new cooperative sectors (Borzaga, 1996; Borzaga & Janes, 2011).

In general, in Italy social cooperatives, even if they are not the predominant form of enterprise, still play an important role within the national economic context. According to the Euricse (European Research Institute on Cooperatives and Social Enterprises) report which examines both sectoral differences and the economic situation in national context, the number of social cooperatives in Italy is about 14,000 Although the Euricse survey is among the most accurate, it remains difficult to make a clear distinction between type A and type B cooperatives. However, to date, the Italian National Institute of Statistics (ISTAT) remains the main source for making historical comparisons between data, to frame with growth percentages, the phenomenon of social cooperatives in Italy, for example, referring to ISTAT data we know that in 2015 working cooperatives and social cooperatives had generate the most value added of whole cooperative sector equal to 73%. The strong growth of social cooperatives is partly due to legal regulation and partly to the growing demand for welfare services both from the community and from the individual founders of social enterprises (Galera & Borzaga, 2009). In this regard, to correctly frame the flowering of these enterprises it is important to underline how towards the end of the twentieth century in Italy there was a crisis of the welfare state that had become inefficient and state centred. In this period of economic and social crisis, cooperative enterprises began to flourish. Thanks to their social mission, cooperatives became the answer to market and government failures, which were mainly due to budget cuts that led to an increase in unemployment with a subsequent growing economic disparity and an increase in people at risk of poverty and social exclusion (Riva & Garavaglia, 2016). In this context, the strength of cooperatives lies in their ability to promote an alternative model of growth and development to that commonly adopted by for-profit companies. The alternative model translates into the creation of opportunities for economic and social inclusion and the ability to adapt political decisions to the interests and values of stakeholders (Linzalone & Lerro, 2014; Kerlin 2006). Moreover, there is a large part of the literature that has highlighted the factors related to the resilience of social cooperatives (Cecop-Cicopa Europe, 2010; Euricse, 2015; Depedri, 2010). The human capital, among other factors, is a key element for the success of social enterprises. Indeed, much research has shown that workers in social cooperatives show greater commitment and loyalty. These elements translate into lower turnover but an high organizational effectiveness and productivity (Carpita & Golia S., 2012; Becchetti, Castriota & Tortia , 2013). In recent years, in order to withstand competition in the market with other types of companies, there has been increasing diversification within social cooperatives, which contributes to the development of multidisciplinary in terms of both professionalism and services offered (Euricse, 2015). On one hand, this multidisciplinary has contributed to increasing the resilience of cooperatives in the economic context, making them capable of facing and resisting the current economic crisis; on the other hand, a more varied composition, and a continuous drive for innovation in the organization flows allow a better adaptation to the social changes underway. Moreover, the merging capacity, the strengthening and renewal of the supply chains have contributed to increase productivity and competitiveness in this sector. In agreement with Shaw E. and Carter S. (2007) we can state that social cooperatives have been identified as an innovative model to address

emerging socio-economic needs. However, despite the positive aspects, some research and studies also explain the difficulties that social cooperatives have had to face in the process of affirmation (Linzalone & Lerro, 2014; Thomas, 2004). Nevertheless, type B social cooperatives enjoy an advantageous tax regime, the outsourcing of public social services from social enterprises and the reduction of their budget are threatening the prosperity of cooperatives. Some studies have identified as major problems perceived by cooperatives: (i) the difficulty of opening to the market and becoming more independent from the public sector; (ii) the decrease in public procurement contracts by public authorities contributes to increased competition on cost-effectiveness by forcing cooperatives out of the market; (iii) the difficulty of obtaining financing and late payments by clients (Euricse, 2014; Riva & Garavaglia , 2016). Although in the past, social cooperatives have been fully able to respond to social needs, in the current context characterized by a strong complexity and also by a progressive reduction of resources, they are increasingly called upon to respond to new and particular needs (Linzalone & Lerro A., 2014; Depedri & Turri, 2015).
In this framework, the present paper aims to study the current situation of Italian cooperatives not only in terms of growth and in terms of development, as already discussed in the literature through statistical, qualitative and quantitative studies. Rather, we want to investigate in deeper the internal organization and the problems related to the management of human and material resources. To this purpose, we will use the Systemic Design (SD) approach, an alternative business and design model able to provide interconnected solutions to the typical complexity of current situations, without neglecting social, environmental, and economic contexts. The analysis is strengthened from a real case study, a cooperative in Northern Italy, in order to work with primary and original data, like the historical evolution, the sectors of activity, the internal structure and the organizational flows of the work, and so on. The first step in the SD methodology is the Holistic Diagnosis (HD) to map the current scenario in all its complexity. Since the HD requires a deep level of detail, we decided to start with a single case study to use it as a reference to develop the analysis of other comparative case studies in the future, especially outside of Italy in order to have a more European scenario. The result that the study wants to achieve is to understand what are the critical issues in the current organizational model of the social cooperative, with respect to the new needs of the economic and social context. Once the criticalities of the current model and the needs of the reference context have been identified, we will proceed with the SD methodology in order to design a new model of social enterprise organization that can be replicated also on other similar realities. A fundamental aspect is also to facilitate the birth of new synergies that can involve not only public administrations but also private subjects, single citizens, or companies. The limits of the research are mainly related to the difficulty of finding all the data necessary to carry out an accurate mapping of the cooperative under examination. In fact, the cooperative in question has been in business for 30 years and has gone through many different phases that have brought with them changes in human resources and activities. In addition, there is another difficulty in obtaining information on the organisational flows of the work due to defined but not so rigidly defined roles within the cooperative as in a for-profit company, which makes the

changeover and maintenance of information more dispersive. However, we feel that by applying the SD methodology we could make a significant contribution in the innovating sector. We aim to increase knowledge about social cooperatives as an innovative business model aimed at meeting the emerging needs of today's society and to develop a new organizational strategy that meets both economic growth and workers' needs.

Method

For many years, there has been a concern to understand the growth of social cooperatives and their development in different territories. Some research has adopted qualitative methods to explore the co-evolution of social enterprises and the welfare state in Italy (Testi, Bellucci & Biggeri, 2017; Corbie, 2012). Different methods have been proposed to assess the economic benefits that these enterprises are able to achieve (Kohonen, 2012; Arogyaswamy ,2017; Cordes , 2017; Gordon, Wilson & Tonner , 2018). However, given the strong growth and development of social cooperatives and because of the difficulty in finding financing for their activities, impact assessment has become a much more discussed topic in recent years. In fact, quantitatively assessing the social impact of a cooperative can serve both the financiers, as a basis for evaluation, and the social enterprises themselves, to understand if their work is working and if it meets its objectives. The literature has developed a lot on this issue, applying different methodologies, for example, the activities and outputs created (i.e. jobs, tangible products, cost reduction…) have been examined and evaluated as main indicators of benefit delivery or results (Olsen & Galimidi, 2009). Then there are approaches such as Social Return on Investment (SROI) and Blended Value Accounting that seek to combine financial value with social value to define a single parameter that represents the company as a whole (Kroeger & Weber , 2015). Therefore, we want to try to go beyond the evaluation of the most easily measurable or immediate results (Arogyaswamy, 2017), because these types of evaluation have a big limit in the field of social cooperatives, and especially type B social cooperatives: it is not always possible to give back the results of an activity in monetary terms. For example, the inclusion of a disadvantaged person in the labour market can be evaluated in economic terms as a monetary amount saved to the state for the economic support of that individual. However, being able to assess how long the individual will remain in the labour market or whether or not he or she will have negative effects is not taken into account. In relation to this, it is therefore useful to ask whether it is no longer necessary for type B social cooperatives to talk about social impact monitoring rather than evaluation.

According to what has been described, in the current framework of cooperative enterprises there is a fair degree of complexity both in terms of what to assess and how best to assess it. The aim of the paper is to investigate through SD the complexity of the relationships between the company, the workers and the results achieved, finally defining a new system based on social, environmental and economic sustainability. The SD is an alternative design approach able to provide interconnected solutions to the complexity that characterizes the current situations, including in this process also the economic, social, and environmental contexts (Battistoni, Giraldo Nohra & Barbero, 2019). For our study and for the promotion of

an even stronger social cohesion and flourishing of local economies, the SD intervenes with the HD. The HD is an analysis process that determines the context of the system, considering both the quantitative and qualitative characteristics of the scenario under examination. Through the data collected through HD, problems and levers for change are identified. The next step will then be to define guidelines for co-designing a new system whose results are accessible and understandable to all stakeholders.
The HD, applied to our case study, is divided into two steps: the first involves in-depth analysis of the cooperative's internal relations and its operational context; the second is divided into top-down and bottom-up analysis to map the relationships with the entire value chain. Initially, we proceed to analyse the current organizational forms of workflows and the policies in place, the basic activities in the cooperative's sectors of reference and, finally, we identify all the potentialities that can be stimulated to promote sustainable development.

Specifically, phase 1:

We analyse the cooperative enterprise from its birth and historical evolution, then we examine the organizational structure from multiple points of view: workers' composition by age, cultural and economic dimension, scope of intervention. The data are collected directly at source thanks to the collaboration with the cooperative under examination and with its members. The information collected shows that the co-operative has most workers with fixed-term contracts and the majority are of Italian nationality; in fact, only 13% of the workers are of foreign origin (Fig.1). The average age of the workers is quite high, more than half of them are over 50 years old, and this factor has been identified as an influential aspect in the cooperative's capacity for growth and development. Having an older workforce implies greater difficulties in implementing internal changes especially about the digitalisation of processes and the transfer of knowledge. Most of the workforce is male, but this is due to the types of work carried out which often require greater physical strength but in no way attributable to discriminatory issues (Fig.2). In this context, the most important factor is the type of people the co-operative hires to fulfil its social mission. A 30% of the workers fall into the category of "socially disadvantaged people", which according to Italian law includes ex-prisoners, ex-alcoholics, and people with past drug addictions or in recovery, people with physical and mental disabilities. A peculiarity of the co-operative in question with respect to other co-operatives of the same type is that it chooses among disadvantaged people those who do not have any kind of work experience. In this framework, it is necessary to point out how much the social mission can influence and, in some ways, slow down the development of the organisation. Often these people are trained with the aim of making them acquire knowledge and skills useful for the job, but very often, they cannot sustain career transitions to roles that require responsibility. For the initial phase of historical analysis, interviews were carried out with the president of the cooperative and with the older members. For the organizational flows, information was collected through interviews with the department managers (Gardeners, Cemeteries, Selected waste collection) and took part in the weekly meetings in which the problems faced during the week were brought out. In this way, the designer has an immediate feedback on the validity of the data.

Once phase 1 is finished, it is necessary to frame the potentialities for the development and change of the cooperative and to do so it is essential to move on to phase 2: top-down and bottom-up analysis. In this phase, we proceed to map all the relationships with the stakeholders involved to identify the strengths and weaknesses on which to work together. HD requires a high degree of detail, fundamental to map and understand the intrinsic complexity of the study context. According to the HD results an high dependence from public institutions emerged, tangled relations with employment office for workers recruitment and internal resistance to change especially in the management sector.

Case Study

The type B social cooperative, Agridea is based in Turin. It was founded in 1992, following the publication of Law 381 of 1991, as a spin-off of another social cooperative called Stranidea. The initial sector of activity concerned the management and maintenance of green areas and there were five social workers in total. In 1993, the management of cemetery services was included, and so the second sector of activity was born. However, the first important development was in 1995 when Agridea was entrusted by the city of Turin with the management of urban green areas with a 2-year contract. Thanks to this first contract, the cooperative can obtain loans that it will use to buy the necessary equipment and to train its workers after this first big leap, the intention to create a more structured organization begins to manifest itself. In 2005, in collaboration with a Consortium, Agridea started to test the separated waste collection from the markets. The cooperative has grown significantly; to date it has about 70 workers and dependent members of which 30% are disadvantaged, as required by legal regulations. The governance model adopted by the cooperative is a traditional one, i.e. there is a board of directors, in this case represented by the president, vice-president and director, and a Board of Statutory Auditors, which supervises the work of the administrative body. The analysis of the organisational structure has shown that Agridea adopts a hierarchical model, which today is found almost exclusively in companies of minimum size. This model is functional thanks to the speed of transmission of orders and the transparency and clarity of relations. However, this organisation makes difficult the specialisation and the creation of “key roles".

Results and discussion

The growth of social cooperatives throughout Europe has gone hand in hand with the evolution of social problems. In Italy, too, this phenomenon has triggered a growing development of this type of enterprise. The SD approach with HD, promotes a multidisciplinary approach that brings together different stakeholders from different levels of the cooperative (managerial, operational, collaborative contacts with external bodies...) and provides the starting point to establish an innovative co-design. From the first part of the HD emerged a strong ability of Agridea to reinvent and develop itself in a quite autonomous way. In fact, since the birth of Agridea (1992), analysing its historical evolution, two years of economic loss have emerged, one in 2006 and one in 2010. The losses have always been absorbed in a maximum of two years and all sectors of activity have been maintained. This fact can be summed up in a good ability on the part of the management sector to manage difficult situations and to be able to recover. At the same time, we point out that in both years of crisis, all the workers remained in Agridea, no one resigned or was dismissed, a factor that shows a strong link on the part of the employees with the cooperative reality, which in turn contributes to strengthening the resilience of the cooperative. Another aspect that emerges is Agridea's willingness and ability to structure its

office staff in a more hierarchical way and with better defined roles, in the last few years this has improved the difficulties in managing the three sectors of activity: gardeners, cemeteries an selected waste collection. While on the one hand the hierarchical approach allowed a better management of tasks and work, on the other hand it contributed to a centralisation of responsibilities especially in the sector heads. This has led the co-operative to have a strong dependence on the people who incorporate these roles and who have become "indispensable" for the proper functioning of the whole organisation. Initially, what appeared to be an already consolidated organisation, HD brought to light the most hidden criticalities (Fig.3). When looking in detail at the organisation of a single sector, critical points emerged in the various areas. For example, the sector leaders must deal with the management system and the preparation of the daily programme according to the work to be carried out. The management system requires digital skills, which the managers have acquired through training. This training has not been extended to other workers who could potentially replace the current sector managers, so the co-operative does not currently have people capable of replacing the current managers in office tasks. This leads to two others closely related problems, a managerial culture, which is not encouraged and unilateral substitutability, i.e. the heads can fill in the gaps in the operational area, but the opposite is not possible. The head of each sector must interface with the administrative area for customers and suppliers, which constitutes an additional burden of tasks for the sector heads who, especially at certain times, e.g. holiday periods, monthly closures of activities in terms of budget, have an overload of tasks to perform that sometimes forces them to stay beyond the 8-hours working time. Finally, from the analysis of the production area and therefore, of the management of the workers, a strong operational-strategic dependence between the teams of workers and the sector manager emerged. There is a lack of intermediate responsibilities among workers who are unable or unwilling to take responsibility for operational and organisational choices even when they would be able to support them thanks to previous experience. Moreover, there is no horizontal mobility between sectors, although it could be activated in some tasks.

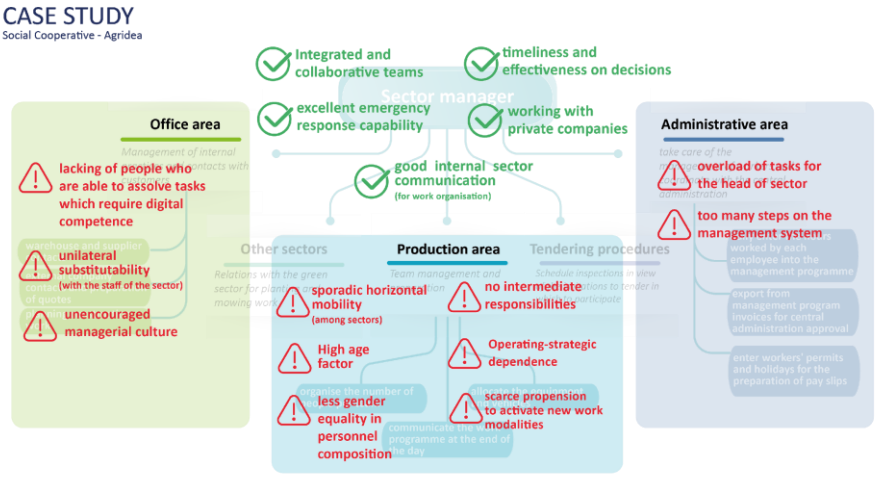

Fig.3 Criticalities and potentialities of a sector

Among the positive aspects that emerged, there is certainly good internal communication between sectors and efficient timing in making decisions, especially in response to work emergencies.

The teams are integrated and collaborative in two sectors (gardeners and cemeteries) while the sector of selected waste collection sometimes suffers from conflicts between workers. Furthermore, among the critical aspects that emerged between the first and second phases of the analysis, there are the difficulties in communicating changes and their acceptance. Communications between the sector managers and the workers are quite efficient but there is resistance for some subjects, especially in monitoring the proposed changes at organisation and management level. Interviews with the president and the workers' members showed that of the three sectors, the selected waste collection is the one that has had the lowest growth and for which there has been no news for many years. At the organisational level, there has been a strong propensity to solve problems in the immediate future, probably thanks to the solid experience of 30 years of work. At the same time, an inability to plan solutions to problems that are repeated cyclically (i.e. at seasonal level or annual) has also emerged. This may be partly due to have mostly works through tenders with variable durations: it is difficult to apply a method for solving problems that there is no certainty of having to deal with those problems again. Based on these assumptions, we decided to deal with the transmission of information as a first step to be able to implement organisational changes in the future. Given the nature of the company and its workers, it is indispensable that all the workers of the cooperative are aware of the processes active in the organisation of work, in this way it is possible to raise awareness towards the assumption of greater responsibility and collaboration.

In this perspective, an active training course was started which involved a first group of 30 people. At the end of the training, we expect to be able to identify among the workers those

who have shown greater predisposition in assuming roles of responsibility and who are evaluated by colleagues as reliable. The final intent will be to implement changes in the cooperative not only as regards the organization chart but also in the management of workflows. Moreover, the organizational changes should come through a co-design process within the workers.

Conclusion

The paper analysed through the methodology of SD the case study of the type B social cooperative, Agridea, in order to have some preliminary data and reflection on how the organizational model could be more effective in this times. The intent of mapping the growing complexity in the economic and social context that cooperative enterprises must face is to design a new organizational model concerning both the internal structure and therefore the roles and responsibilities of employees and external activities. With the new model, the aim is to develop new supply chains and new synergies, able to make the cooperative strong and resilient in the territory and in the context of action. This new type of social enterprise will be able to contribute to the development of new local economies, and the social impact will be greater as the relationships and actions undertaken increase. Above all, not only an innovative organizational model will be valuable outcomes of this research, but also the way in which this will be designed. This study aims to be the first step in the development of a project that will lead the Agridea cooperative to concretely implement the new model of organization. In addition, the paper contributes to the scientific literature by providing a deeper knowledge on the needs that social cooperatives must diversify within the national economic context. Moreover, it wants to contribute to the development of a more sustainable cooperative economy with full respect for the social mission.

About the Authors:
Caterina Rosini is a PhD student in Management Production and Design at the Politecnico di Torino (Department of Management and Production Engineering). Her doctoral research focuses on applying the Systemic Design in organizations, especially cooperatives, with the intent to boost the development of a sustainable enterprise model which respects the resources of our planet, both humans and materials.
Silvia Barbero, PhD, is an Associate Professor at Politecnico di Torino (Department of Architecture and Design). She is a lecturer of "Product Environmental Requirements" at the Design and Visual Communication degree and of "Open Systems" at the Systemic Design Master degree. She is also responsible for the stage & job in design curriculum. Her research mainly focuses on Systemic Design applied to territorial sustainable development.

Abstract | Within the framework of the Erasmus + KA2 Strategic Partnership in Vocational Education & Training program, the Craft your future project is being carried out. The aim is to show the result of three years of work in the regions of three countries as a Case study. At this time, we are evaluating the impact and disseminating the achievements. We already have interesting evaluations to share in this congress. The Craft Your Future project unites educational institutions, students, local authorities, creative centres and (social) businesses in creating a strategy that help regions use intangible cultural heritage to increase their attractiveness, boost local economies and build a future based on regional resources. The Craft Your Future strategy is founded on the vision that young people are the source of tomorrow's economy and therefor need to be in the lead in designing future strategies. Developing students' leadership competences, pro-activeness and entrepreneurial mind-set will steer change and innovation.

KEYWORDS | CULTURAL HERITAGE, CRAFTMANSHIP, DIGITAL TECHNOLOGIES, SUSTAINABILITY SHAPE OUR IDENTITIES AND LIVES, CIRCULAR ECONOMY

1. Theoretical framework

One of the most detailed difficulties in time that perhaps best describes craftsmanship is that of a *"careful, deliberate planning, skill and execution process in which a consistent relationship between the artist and the object occurs"* (Oxman, 2007). In this process, the object and tools are not clearly defined, but rather inform a gradual process of searching for forms. If you added this description the concept of Pye on manual work, in the *"quality of the result is not determined, but depends on the judgment, skill and care that the creator exerts while working"* (Pye, 1968), we will see that the technological factor not determined to the craft but that participates in the relation between who designs and the own object that constructs.

It is true that we are not aware of the benefit of handicrafts both in terms of the possibilities of obtaining short series, unique pieces and even restoring existing artifacts or objects, as well as in the benefit of the community, as much more sustainable manufacturing units, circular and close than the industry represents. To these productive and economic factors, the cultural ones are joined, because we have a heritage that many times, we do not know yet having had a real and important presence in our regions.

In this sense, UNESCO will tell us that any effort to safeguard traditional handicrafts should focus not on the preservation of handicraft objects, however beautiful, precious, rare or important they may be. In this sense, the creation of conditions that encourage artisans to continue producing handicrafts of all kinds, and to transmit their skills and knowledge to others, is defined.

To give an example of what craftsmanship for the economy of a country still entails and the value it represents, just cite as in a country that historically suffered more the impact of industrialization than in others, it approximates 3.4 billion pounds in the UK, which represents 0'3 of the country's GDP. But at this point, what does craftsmanship mean to our young people, how do they perceive it and what future could they develop in that productive, economic and cultural context? Professors Martin Woolley and Amalia Sabiescu (2015), can give us an orientation or clue to this question when they talk about traditional and new skills around crafts. The first of these are the improvements that these new ones bring about the digital transformation, incorporated in the manual manufacturing process; the second is the promotional one, in its help both to commercialize and to make crafts known; the third is to register and disseminate knowledge and craft skills; and the fourth, the one used to transfer the skills and knowledge of manual manufacturing to new production contexts.

This leads us to assess these points of view from which we would have to reflect future reflections, which we will consider useful to establish a clear encounter between handicrafts, digital technology and the circular economy: one, the change of the business model around

the crafts; two, the use of technology itself, in which reflection revolves around its personal or collective incorporation, taking advantage of the emergence of maker or fablab spaces; three, the one that revolves around its social perspective and its impact on the community or region, with the collaborative results that can be developed; and four, how can this implementation of the so-called digital crafts be carried out, with what resources to count and the interests that may be taking place in each case.

Several authors come to interpret and define digital crafts, as a new way of making crafts that uses these processes and technologies to develop their proposals (Shillito, 2013), which not only depends on the usual or accredited craftsman, but on other professionals with guidance creative (architects, designers) or technicians (engineers, makers), but whose goal is to solve unique 'artifacts' or very short series. Other cases, understand that the main craft trade today goes through digital specialization, and that these experts 'non-craftsmen' are the new digital artisans (Jabi, 2013), the result of interdisciplinary education. Close to that principle, the concept of personal manufacturing, somehow identifies that idea of taking advantage of digital manufacturing spaces where that tactile counterpoint is provided, to that of the digital environment (only based on computers and images) as Negroponte reflected at the time (1995) and specified Gershenfeld (2005). Doyle (2016) proposes the idea that digital craftsmanship comes from computational thinking, digital manufacturing and robot construction, separating it from traditional craftsmanship by appropriating their meanings (related to inherent materialization). Authors like Carpo (2012) argue that the digital world does not have to be seen as an alternative or a substitution to crafts, but as a complementary dimension, which has allowed architects, designers and engineers' greater freedom in the physical world.

Regarding this last vision, we understand that a new world of opportunities for artisans and creative opens up, by allowing technology to perform geometries and tasks that were previously impossible or more complex, to be able to combine materials, and all this in a simpler, faster way and economic in many cases (Martínez Torán et alt., 2012). Juan Carlos Santos (2011) defines this opportunity as techno-craftsmanship, to this progressive incorporation propitiated by digital manufacturing, and where the role of designers appears as fundamental. There are variables that bring us closer to a new mode of craftsmanship under the influence of digital transformation, such as the examples of customization that have been possible thanks to these digital manufacturing technologies. This customization represents that beginning of a closer relationship between production and digital consumption that allows the creation of unique designs based on user specifications. However, the design methods used in the creation of these forms are not yet sufficiently exploited given the potential that digital technology allows creating unique, hybrid and / or individually designed forms (Bunnell, 2004). On the other hand, the ability to produce customized products with moderate prices, predicts a paradigm shift of what has come to be called personal manufacturing. Each time the concept of *fabbing* is understood, applied and appreciated, while young (and not so young) entrepreneurs design their own shirts, print

bound volumes of their own written or illustrated work, or sell jewelry that they themselves have designed (Bell et al., 2010).

Figure 1. Spanish students from UPV at Craft Your Future training week Leewarden, Netherlands, October 2018.

Digital manufacturing has also transformed processes in the last twenty years, and has allowed the validation of the work of architects and designers through "research through manufacturing" (McCullough, 2015), and maker culture (DIY) is intervening through tools such as Arduino, robotics and electronics in this new model of crafts that incorporate other 'trades' when prototyping (create a digital model, 3D printing, programming, etc.). McCullough believes that digital manufacturing takes craftsmanship, especially the model configuration process, and the variations it makes with its creation. From the maker culture, it coincides in those aspects related to the selection of resources, the adjustments to the model and how it calibrates those details that allow solving the 'artifact' according to the chosen process.

Different initiatives of recent years, such as the Lab Craft (Craft Council) exhibition, have made it clear that the best work occurs when an artisan marries his skills (trade), aesthetic sensitivities and knowledge of the materials, with the possibilities of digital tools available today (Fraser, 2010).

Figure 2. Craft Your Future training week in Bulgaria. The week lasted from Monday 2nd to Friday 6th of September 2019. Students realised that the knowledge about crafts that is still very much alive in Bulgaria, combined with new digital techniques and preferably made of renewable raw materials is a source of inspiration for the design and manufacturing of new, future-proof products.

Within the project Craft Your Future we indicate that we want students to be in the lead. We do this based on the conviction that you can only really learn when the student takes control of his or her own learning process. As a basis for this we take the principle of work-based learning. In other words, we bring real time activities and real issues in education or let students look up real time issues and activities in order to come to learning from them. This does not happen by itself. As an educational institution, it is therefore necessary to make arrangements for collaboration in connection with the relevant network. We also call this 'organizing spontaneousness', a framework within which students can get down to work and ask to investigate. In this approach to work-based learning, we see reflection as the motor of learning. In it, reflection (before, during and after) should ensure that students make choices in learning and that learning becomes meaningful as John Dewey expressed it in his pedagogical vision (Woerkom, 2015). This specifically involves reflection as a systematic and critical process, aimed at acquiring knowledge and leading to action (Woerkom, 2015; Mittendorf, 2015). This process of reflection before, during and after leads to new actions and leads to self-regulation (Zimmerman, 2002). Self-regulation, however, is not something that students have or that arises by itself (Kostons, Donker, & Opdenakker, 2014). This requires concrete efforts of both students and teachers (Kostons, Donker, & Opdenakker, 2014; Katholieke Universiteit Leuven, 2016; Zimmerman, 2002) in building up self-regulation

skills. It is therefore a misconception that self-regulation can be expected directly from students or that self-regulation is synonymous with self-reliance (Luken, 2008). When lecturers expect students to adopt a self-regulatory approach, they will have to support and supervise a lot in this. This is the core and essence of the educational approach to be developed in Craft Your Future! To this end, not only the educational material will be developed, but also the regional network will be involved to make this method of self-regulation possible (freedom within frameworks). The 'introduction' of self-regulation in education therefore means that instructors will need to provide a great deal of support and guidance in order for students to take the lead. Instructors will have to get used to their new role, which is more coaching and focuses on the student rather than their subject (Lucassen, 2016). Important in promoting students' self-regulating skills is the use of hints (reflective questions) and modelling (Kostons, Donker, & Opdenakker, 2014; Katholieke Universiteit Leuven, 2016). Teachers can give these hints when they see the connection between the elements that are connected within Craft Your Future; i.e.: using craft principles through new techniques to realize a circular economy. After the teachers themselves had gone through the phases of self-regulation in an equivalent assignment and setting as the students, they really understood what self-regulation was and how they could apply it. This is what the educational approach within Craft Your Future provides for. The reflective questions designed in the model of self-regulation (Zimmerman, 2002) also help in practice to promote self-regulatory skills among students.

Figure 3. Craft Your Future training week Bulgaria, projects and presentations about the different cultures proposals.

Regarding the integration of these digital processes in education, manufacturing processes and digital "doing" are a new and important chapter in the processes of creativity, literacy and expression resources for children and young people in their training processes (Blikstein,

2013). Today, the range of accepted knowledge has expanded, to include not only programming, but also engineering and design (Astrachan, Hambrusch, Peckham, & Settle, 2009; Yasar & Landau, 2003).

Now fossil resources are getting scarcer there is more demand for waste material and renewable resources. In addition, the pollution impact of oil and other fossil-based materials has become more transparent that people are more active in looking for alternatives (Sumter, D.; Bakker, C. & Balkenende, R., 2018; Andrew, R. M., 2018).
Ellen Mc Arthur developed the model Circular Economy, a framework to change the economy from a use-and-through-away-system into one that can be restored a redesigned. Thinking this way demands a new approach for product designers.
Designing within this model aims to think about the biological systems using renewable resources and technical systems re-using existing material to use for production, consumption and end of use to create a waste-free future (Chamberlin, L.& Boks, C., 2018). Designers are challenged to approach this waste-free system in creating tangible products as intangible services to establish a sustainable cycle.

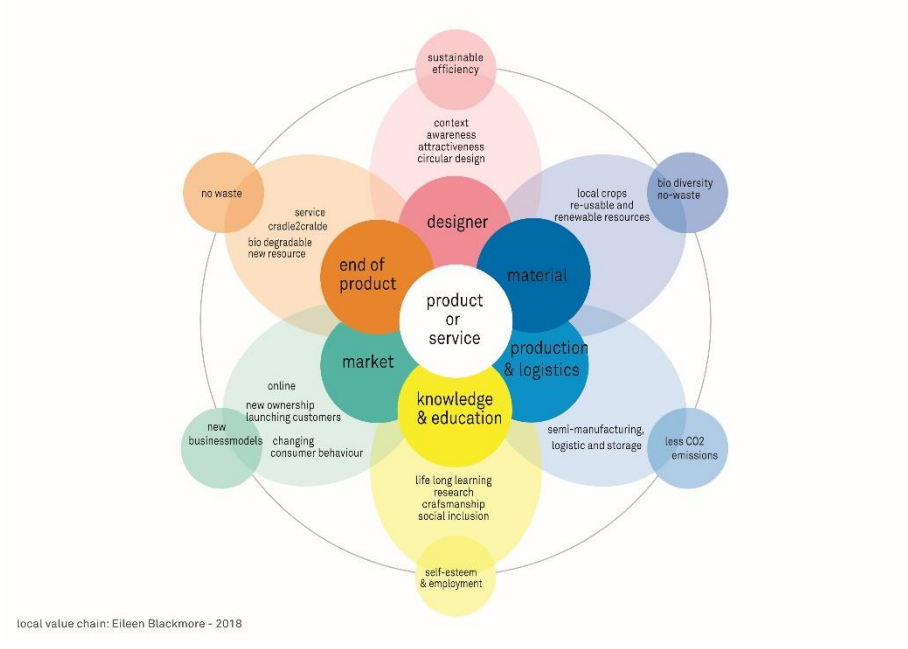
We live in a world where products are designed to be replaced as often as possible and not designed to last as long as possible. Due to marketing we are triggered to buy new products even sooner than the products' end to even hasten this process, quite the contrary to the crafts which are made to last.

Circular focuses on the resources of sustainability and stives to consider the entire lifespan of a product as a complete process (Mugge, R.A. 2017). Looking back to the crafts, we can learn a lot of craftsmen how they gained their resources and reused them. The role of cultural heritage including the stories of family ties and traditions, attached to the crafts products, gave people an identity and made people proud. This resulted in preserving these products carefully.

2. Work methodology

To start working on a project in which circular economy, craft and digital technology can be used. Students and teachers define a societal problem first that they would like to approach by the three subjects. These matters are from a sustainable perspective and affecting the direct region of the institutes. To work on the problem, the students' research what stakeholders are involved and use the Local Value Chain model by Eileen Blackmore to do this. The aim of this model is to map out all the activities concerning the societal matter, in order to look at where value can be added and benefits can be created at the same time. In addition, there is the circular value chain in which the principles slowing down, narrowing and closing of material flows are important added by social values to the value chain in which sustainability, society, quality of life and creative design power as important pillars. In this model the links in the production chain affects the effects on the environment and society and use the power of the region. The local value chain consists of a core, surrounded by 5 links and a core value at the output of each link. The values are; less waste, biodiversity, reduction of CO2 emissions, generating local knowledge and employment, new

revenue models and changing buying behavior. The product and system designer plays an important role in our model and has a connecting role between all links. Design is the discipline of generating solutions to problems and developing opportunities by "making" something. The designer was caused to make lasting change and improve the quality of life. Students and teachers learn how to redesign systems into sustainable systems, using the model as methodology and the three pillars of the project as approach, as well as an active engagement of the external stakeholders.



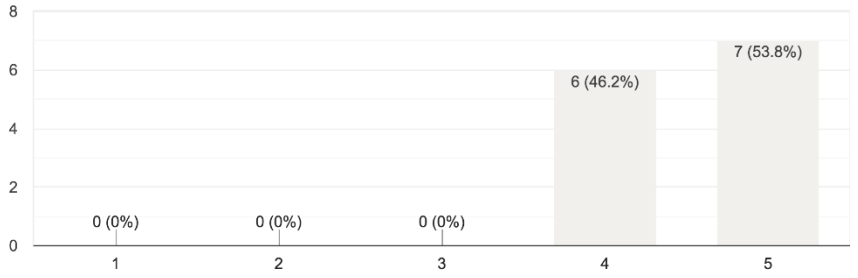


Figure 4. Local value chain by Eileen Blackmore (2018)

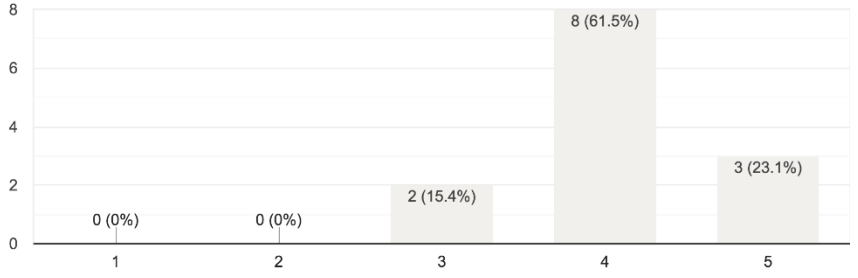
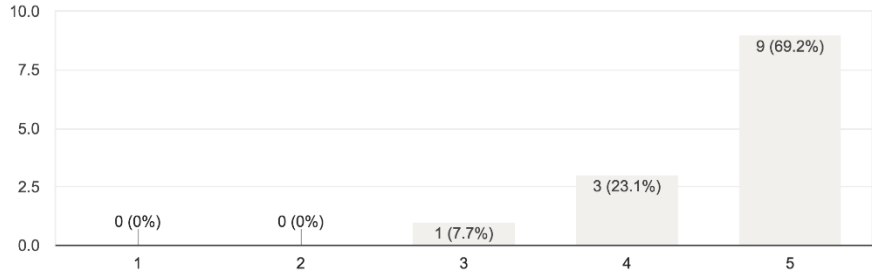
3. The results: First evaluated indicators of the Craft Your Future project

The project partners already evaluated the Leeuwarden meeting after the processing the data extracted by the responses of the young participants of the meeting, for which our partner of the Universitat Politècnica de València has taken responsibility. We can announce as a very satisfactory data that young people considered the knowledge they obtained about the traditions and crafts of the region as a very high (84.7%), and what is relevant for the EU, which can be assumed for their future (Craft your future).



We can advance that among the most satisfactory data, young people considered the knowledge they obtained about the traditions and crafts of the region high-very high (84.7%), and what is relevant for the EU, which can be assumed for their future.

Table 1. Graph on the response that young people gave, after the first meeting of the project, to the importance of cultural heritage and crafts. (1 = Strongly disagree; 5 = Strongly agree)



Regarding the effects and importance of the circular economy, a very similar result is also reproduced (84.6%).

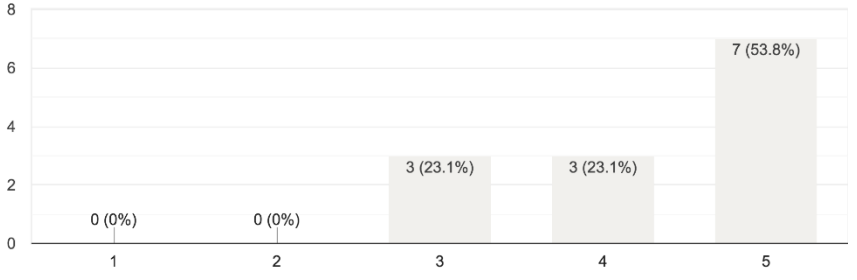
Table 2. Students received examples of circular economy during the meeting held.

Regarding the interest and the possibilities of innovating through digital manufacturing technologies, the data is lower but with a high figure of 76%, although they consider it very important for them (also in 84.6)
Other relevant figures are the stimulus that has creatively meant for them to participate in the meeting (92.4%), and the relevance of being able to access spaces that enable this creativity (92.3%), as was the DLab.

Table 3. Students believe it is important to develop creativity and have meeting spaces that stimulate that creativity in the EU (fablabs, hackerspaces, creative hubs, etc.)

Regarding the meeting held in the Netherlands, the data reflects both satisfaction and the fulfilment of objectives in a very high order. 69.2% recognize that they can develop competencies around the project areas in a short-medium term and that this can influence at the labour level (77% would like to work in some of these lines in the future), and 53.8 believe the possibility that innovative projects can be developed around these three areas is very high.

Table 4. Young people believe that it is very possible to innovate through crafts, circular economy and digital technologies



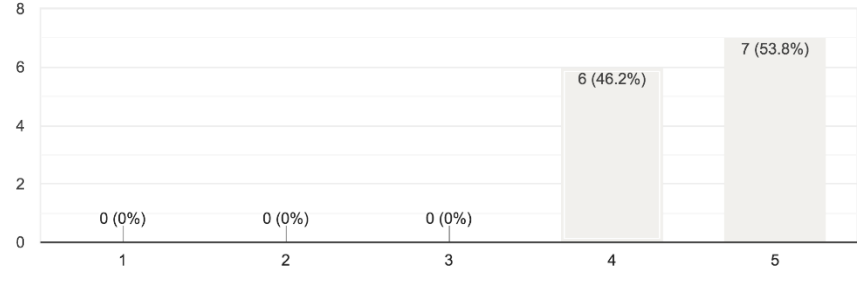


Table 5. For them, more initiatives that work on these areas in the EU would have to be developed

A 77% would be interested in deepening with more training in these areas and 69.3 believes that it would be necessary to have specific information on the Internet, 100% being those who believe it is necessary to develop more initiatives of this style in the EU. Almost 80% believe that teachers would have to provide them with more information in this field, and believe that their classmates would like to meet her (84.6%).

4. Conclusions

In this contribution, horizontal results such as management, evaluation and dissemination give rise, indirectly, to how the cooperation between the partners takes place; the development and the quality of the activities carried out (toolkits, activities, workshops, exchange of experiences, participation of young people, partners and stakeholders', etc.) and ensure their impact.

The quantitative and qualitative supervised indicators that act as criteria to evaluate the results are at least:
• Correspondence between objectives - activities - results;
• Impact achieved in the target groups;
• Comparison between actual and expected quantitative parameters;
• Implementation of the exploitation strategy,
• Efficiency and overall sustainability.

To be more specific, the team of researchers has developed a methodology based on a questionnaire that measures skills acquired in the three pillars of the project, and based on the drafting of a Quality Evaluation Plan. Based on these premises, the development of evaluation indicators for the evaluation of the effectiveness of the project, its progress, the quality of the IO (Intellectual Outputs), the impact on the target group (numbers and feedback), the TNM and the Organization of Multiplier Events (number of participants and their feedback).

The evaluation activities that are included in the IO development methodology and that belong to the activities that lead to the final result, include a baseline measurement after the target groups (students, teachers, working world) participated in the initial Craft Your Future activities. An impact measurement was also made after the students have completed the program. The indicators we show measure the provisional impact reached on the young people who participated in the first exchange of the three countries.

Figure 5. Crafts in today's economy. The Tryavna and Gabrovo (Bulgary), training week (2019), coincides with a large international Craft Congress. During the congress, artisans will not only show their products, but especially their skills, and they will discuss the role of crafts in the current economy. We will bring this knowledge and inspiration back to the Netherlands.

The Regional Partnerships aim to bring together like-minded people and organizations. This defines a strategy that helps regions use intangible cultural heritage to increase their attractiveness, boost local economies and build a resource-based future. Regional strategies and action plans are pioneers in the formulation of actions that are unique to the specific regions involved in the "Craft Your Future" project. It is a strategic regional project on how new technologies and the circular economy can be used to elevate traditional crafts to the new demands of the 21st century.

The project brings together educational institutions, students, local authorities, creative centres and companies in the creation of a strategy that helps regions use intangible cultural heritage to increase their attractiveness, boost local economies and build a future based on regional resources The Craft Your Future strategy is based on the vision that young people are the source of tomorrow's economy and, therefore, should be at the forefront in the design of future strategies for the regions .

The final result will be different deliverables in which the action commitments of the interested parties involved are exposed in various formats (digital and activities fundamentally), guaranteeing the impact and sustainability beyond the useful life of the Craft Your Future project. The contents of the project may be used as best practices and transferred to other regions, and may be widely shared with other schools.

The European project Craft Your Future (ref. 2018-1-NL01-KA202-038952) has been supported in its 2018 call by the European Union, through the K2 Erasmus + program. The following European organizations from the Netherlands, Bulgaria and Spain participate as partners in this project: Friesland College, Learning Hub Friesland Foundation, Stichting House of Design, The Fabric Association, NGPI Tryavna School, Oceanonaranja (FabLab VLC) and Universitat Politècnica de València.

Abstract | The value of culture and creativity in the development processes of post-industrial economies is internationally recognised and plays a decisive role for growth, competitiveness, sustainable development, innovation, employment, social cohesion, the sense of belonging and the spread of shared values. This takes the form of urban regeneration that become spaces in social aggregators, but also in social innovation practices as events, collaborative and aggregative projects, which provide contents and new meanings to territories that are often "unidentified" and "disidentifying", creating opportunities for relationships and networks between social actors, who in turn are bearers and propagators of new values and identities.
Richard Florida 15 years after the release of his first book (Florida, 2002), in the new essay "The New Urban Crisis" (2017), notes the consequences of the rise of the creative class in terms of gentrification and social inequality at the urban level, which have made large urban sections inaccessible to the popular classes with the expansion of the "service class with very little creative or qualified tasks. Perhaps the original sin of the Florida theory consists in not having considered that the "creative class" cannot be merely the engine of economic growth - albeit of a creative economy ... - but that it is necessary to rethink the role that the creatives must have with respect to the society, going to fill the educational role - if not even duty - advocated by Antonio Gramsci when he speaks of the intellectual class (Antonio Gramsci, Prison Notebooks, Einaudi, Turin 1975, vol. III, 1550-1551).
This concept is connected in some way to that "Design when everyone designs" by Manzini (2015) which recaps about the role of "creativity bearers", and specifically design, in contemporary society. A role that Manzini defines as that of an expert designer, facilitator of bottom innovation processes.
A facilitator therefore, and also an educator, who works to bring out those capabilities that the philosopher Amartya K. Sen defines as a fundamental piece to build a measure of well-being as an alternative to the so-called "GDP approach". The development, which Sen defines

in the Human Development Index, is primarily the development of people and communities and economic indicators are freedom, quality of life, justice: a fundamental paradigm shift in which the criteria for defining poverty are no Longer attributable to a lack of resources but rather to an insufficient freedom to conduct adequate existences or a lack of capability (Sen 2000). Cultural production is closely linked to the territories in their complex anthropic and social stratification and it is impossible to think about the development of a territory without taking into consideration the social capital as a whole. Francesco Zurlo, about the concept of creativity, believes that this is a term that has now been abused and that it is, and must be, linked to a territory and a social capital.
A development that takes place through culture cannot therefore be considered only from an economic point of view, but rather in terms of increasing the skills of various kinds, distributed over a territory that thanks to creativity can grow in a virtuous process.
Perhaps this is the great challenge for the cultural and creative industries: to make an ethical choice according to the logic of social responsibility of culture, promoting actions that have a real social relevance, encouraging participation and placing the public at the centre. A choice therefore not dictated exclusively by the economic return but also by the intent to produce value by creating more active and aware communities.

KEYWORDS | SOCIAL INNOVATION, FESTIVAL, CREATIVITY, CULTURE, ETHICAL & CIVIC DESIGN

1. The value of culture and creativity in territories development

The value of culture and creativity in the development processes of post-industrial economies is now universally recognized at an international level. From the report on the economics of culture prepared for the European Commission by KEA – EUROPEAN AFFAIRS of 2006, to the "Unlocking the potential of cultural and creative industries, Green Paper" of 2010, it emerges that culture plays a decisive role for growth, competitiveness, sustainable development, innovation, employment, social cohesion, a sense of belonging and the dissemination of shared values. Cultural activities, in addition to the classical activities related to the cultural heritage, also include the creative sector (creative industries) which includes a set of functions linked in more or less direct forms to production, such as design, architecture, advertising, as well as a composite set of activities related to the information and communication industry.

The spread of well-being and the full satisfaction of basic needs make the "consumption" of culture possible and the demand for added value of consumer products increases more and more, with a demand for products and services in which the creative and innovative component becomes fundamental. In new economies, the symbolic value of material goods becomes increasingly important and the competitive factor of a product is increasingly linked to the quality, experience and meanings it is able to generate. Companies no longer invest in culture or design for merely promotional and communicative reasons but to create content and meanings.

According to Symbola's 2019 report " Io sono Cultura. L'Italia della qualità e della bellezza sfida la crisi.", it is precisely through creativity and design that Italian companies have shaped their products by redefining their meaning, connoting them culturally, strengthening their competitiveness and at the same time enriching a positive image of Italy, ensuring that products "Made in Italy" are among the best known brands in the world. It is even more important in the contemporary context, with the pervasiveness of technologies, to be able to count on "hybrid figures", on the "managers of complexity" as Piero Dominici defines them, "on curricular profiles that know how to hold together imagination and rationality, creativity and methodological rigour, the human and the technological aspects." (Interview with Piero Dominici in Morning Future, 2018)

In Italy the studies and publications of the last decade on the role of creative classes and cultural districts (from Santagata to Sacco) highlight a paradigm shift and the expansion of the very concept of "culture" which is no longer limited only to the material, artistic and architectural heritage and to the level of education and innovation, but it opens up more and more onto territorial capital as a whole and onto human and social capital in particular. The interaction between culture, with its creative components, and the sustainable development of complex territorial systems clearly emerges in the words of Sacco and Blessi:

> “In all the components of the economic, social and environmental reality, the role of culture is increasingly to operate as a synergistic agent capable of providing other sectors of the system with content, tools, creative practices and added value in terms of symbolic value and identity through the enhancement of local assets. Therefore, the importance of culture in the social growth processes of urban areas is also evident, whether they are subject to territorial upgrading processes or when it is necessary to complete the infrastructure planning action.” (Sacco, Blessi, 2005, p.3).

What has been said so far has materialised in the redeveloped spaces that become social containers and aggregators, engines of urban regeneration (not only on an infrastructural but also on a social level), and in the events that provide content to often disidentified and disidentifying territories, turning into occasions for relationships between individuals and for building networks between social actors, in their turn carriers and propagators of new values and identities.

However, it is true that creative processes alone are not sufficient to univocally determine territorial developments. If we think of powerful urban redevelopment and regeneration interventions such as those determined by international events such as EXPO and the Olympic Games or the recovery of industrial areas from the end of the 1980s in many cities in Northern Italy (two cases are the Bicocca in Milan and the Lingotto in Turin) it should be noted that these operations did not generate a real involvement of the communities, giving rise to phenomena of gentrification which further excluded the working classes from development. The local communities have not identified themselves with these operations and evidence of this is the recent refusals of the candidacies for the Turin and Rome Olympics.

Richard Florida in 2002 with the best-selling book "The Rise of the Creative Class" theorised the fundamental economic value of creativity and going beyond the concepts of information and knowledge economy, affirmed the birth of the "creative economy" and the rise of the "creative class" in advanced capitalist countries. The creative class, made up of scientists, engineers, university professors, artists, architects but also doctors, lawyers and managers, has the social function of generating new ideas, new technologies and / or creative content, revolutionising the old hierarchical and formal ways of managing the economy and work and becoming in fact the real engine of globalised development. New poles of development will be those urban centres which, based on the 3T (Technology, Talent and Tolerance) are able to attract this emerging social class.

Richard Florida's so-called "repentance" 15 years after the release of his book is dealt with in his new essay "The New Urban Crisis" (2017) in which he notes the consequences of the rise of the creative class in terms of urban social inequality with a strong gentrification, which has made large urban sections inaccessible to the working classes. In addition, the creative economy and outsourcing have seen the ranks of the "service class" swell, the employees of the services with very uncreative or unqualified occupations: waiters, carers, supermarket cashiers, and finally the well-known "riders". The spread of populisms that culminated in

Trump's rise in America and Brexit's victory in the UK, the returning illiteracy that seems to be getting stronger, actually appears to contradict Florida's optimistic vision: the three Ts, Technology Talent and Tolerance, which constituted the engine of the new creative economy, do not seem to have given rise to a similar response on a social level.

Perhaps the original sin of Florida's theory lies in not having considered that the "creative class" cannot be solely the engine for economic growth - albeit of a creative economy - but that it is necessary to think about the role that creatives must have with regard to society. The "creative people" has first and foremost an educational and ethical duty towards society as Gramsci stated in relation to the role of intellectuals:

> "The way of being of the new intellectual can no longer consist in eloquence, the external and momentary engine of affections and passions, but in actively mixing with practical life, as a builder, organiser, persuader (...) When a distinction is made between intellectuals and non - Intellectuals in reality we refer only to the immediate social function of the professional category of intellectuals, that is, we take into account the direction in which the greatest weight of the specific professional activity is heading, whether in intellectual processing or in muscular-nervous effort. This means that if one can speak of intellectuals, one cannot speak of non-intellectuals, because non-intellectuals do not exist. There is no human activity from which any intellectual intervention can be excluded; homo faber cannot be separated from homo sapiens. Finally, every man, apart from his profession, has some intellectual activity, that is, he is a "philosopher", an artist, a man of taste, participates in a conception of the world, has a conscious moral course of conduct, therefore helps to support or to modify a conception of the world, that is to arouse new ways of thinking " (Gramsci, 1975, pp. 1550-1551).

This definition that - with a certain visionary nature, includes the creative class as a whole as formulated by Florida, is connected in some way to that "Design when everybody designs" by Manzini (2015) confirming the need to question the role of "Bearers of creativity", and specifically of design, in contemporary society. A role that Manzini defines as that of the expert designer, facilitator of innovation processes that arrive from below.

A facilitator therefore, but also an educator as advocated by Gramsci, who works to bring out those capabilities that the philosopher Amartya K. Sen defines as a fundamental element for building a measure of alternative well-being to the so-called "GDP approach", because in addition to this economic indicator there are freedom, quality of life and justice. Development, which Sen defines in the Human Development Index, is primarily the development of people and communities, and this implies a shift of attention from material goods and resources to skills and freedoms, proposing a fundamental change of paradigm in which the criteria for defining poverty are no longer attributable to a lack of resources but rather to an insufficient freedom to lead adequate lives or to a lack of capability (Sen 2000).

In fact, cultural production is closely linked to the territories in their complex anthropic and social stratification and it is impossible to think about the development of a territory without taking into account the social capital as a whole. Francesco Zurlo, wondering about the

concept of creativity, believes that this is a misused term and that it is, and must be, linked to a territory and a social capital.

In all this, Design and "design driven innovation" (Verganti, 2008, 2011), and therefore an innovation not driven by technological innovations or driven by the market, but connected to the "socio-cultural regimes" in force, appear among the mechanisms with the greatest thrust (Lombardi, Macchi, 2016): keeping the fluidity of knowledge, identifying new technological combinations and, above all, generating new meanings and new functions, helping to define new interaction strategies that meet not only territorial needs, but also and above all those of the end user.

A culture based development cannot therefore be considered only from an economic point of view, but rather in terms of increasing the skills of various types - distributed over a territory that thanks to creativity can grow in a virtuous process - of education - to complexity and critical thinking - and citizenship - respecting legality, differences and responsibility (Petrocelli, 2019).

And perhaps this is precisely the great challenge for the cultural and creative industries, that of making a choice that we could define as ethical according to the logic of the social responsibility of culture, promoting actions that have an effective social relevance, encouraging participation and placing the public in the centre. A choice therefore not dictated exclusively by an economic return but also by the intent to produce value by creating more active and aware communities.

If we think of an event like a Festival, a topic that we will discuss as a pilot project in the next paragraphs, the first level of value production is certainly that of the usable product / service, which, however, represents only a tool to achieve the second level of value production, or rather that of the participatory process, which has the most profound and strategic effect, aimed at stimulating community processes. On this second level, the main ingredient lies in the ability to activate territorial networks and alliances with the aim of encouraging the birth of a real urban cultural system that makes the impacts of the actions promoted sustainable over time. Last but not least the educational and training level, understood in its entirety and therefore not only as an expansion of knowledge but also as education for citizenship, aware of the need today, in the rapidity of technological and social evolution, of transversal skills, of flexibility, critical skills and to identify and solve complex problems, but also empathy and sharing. All these skills are constitutive of the designer, or rather of the "citizen designers" who "have both a social and a moral responsibility to use their visual language to address societal issues either within or in addition to their professional practices" (Resnick, 2019, p. 39).

2. Design Driven Innovation strategies for and with the territories, the case of COSè festival

> "In Italy, as in all the other territories of the world, we make things. In our country particular things are produced: Italy is famous for Design and Fashion objects, with an increasingly high added value. In particular, the plain that stretches from Florence to the sea is a vast area where things are produced. A place, the place of things, therefore. Things that populate our homes and that sometimes, due to their ever-growing number, when they become waste, end up besieging us. Things must therefore be rethought: it is necessary to restore a deeper sense to objects, to recreate new emotional relationships with them, to extend their life (so as not to make them become waste). The challenge starts in childhood. Hence the idea of a festival for children and young people dedicated to education about things, because after all, the challenge for a new model of more sustainable development also starts from there ".

These words written by Giuseppe Lotti in the press release (2016) contain the idea of the COSè Festival, which was held in two editions, in 2016 and 2017, between Calenzano, Campi Bisenzio and Sesto Fiorentino, in the middle of the plain between Florence and Prato. The festival was born and was created as an event aimed at local communities with a particular focus on the complex relationship we have with things and a target that ranged from children, to young people, to students of the Design Campus, but also to families and in general to the inhabitants of the plain.

This challenge certainly starts with young children, being more sensitive as well as easier to educate in practices focusing on safeguarding our ecosystem, in every sense. Hence the idea of a festival for children and adolescents dedicated to education about things that in the previous words gives a description of its mission and the starting point that effectively generated the executive project of the COSè Festival[1].

The theme of the first edition (2016) was "us and things" - and was aimed at rethinking the objects that surround us and giving them a deeper sense, recreating new emotional relationships with them -, the 2017 edition instead worked on the theme of "the work behind things" - to be understood as the commitment, the stories, the times and the places behind the objects that surround us, but also the crafts that are no longer there.

[1] The COSè Festiva was conceived and designed by the Design Laboratory for Sustainability of the University of Florence coordinated by prof. Giuseppe Lotti with an extended partnership that involved Convoi social cooperative; LibLab, Library-workshop for children and teenagers; the Municipality of Calenzano and with the involvement of many other territorial entities, including the main sponsor, Centro Commerciale I Gigli. In the 2014/2015 academic year, a thesis was developed: "COSè. us and things, the festival "- by Irene Fiesoli and Ambra Quercioli, Prof. Giuseppe Lotti (supervisor) - Master's Degree in Design, which analysed the theme and developed a coordinated image and graphics of the event.

Around these two macro-themes, programmes of events were organised, of which there were a great variety, both in type and in their reference target: they included workshops, exhibitions, meetings with book authors, open readings, guided tours to local companies, shows and events, some dedicated specifically to schools for all age groups and others open to the public at large. The different lines of action, the quality of the contents and the ability to stimulate users as regards contemporary issues and problems, (from compulsive purchasing, to the theme of migrants, to that of work, sustainability and many others) provided the elements for which the festival has managed to attract an ever wider audience, also involving a particular target such as young people, who recognised the event as an alternative cultural and social moment with respect to the predominantly commercial products that the territory offered[2].

Figure 1. Workshop "Things with art", Fausto Gilberti, 2016 edition.

The primary educational goal of the Festival materialised in workshops on the theme of sustainability, with the desire to make people reflect on the fact that every day we buy

[2] The festival in only two editions was able to involve 350 pupils from Nursery Schools, 350 pupils from Primary Schools, 350 pupils from Secondary Schools, 350 pupils from Secondary Schools. In addition to these, the festival has reached, thanks to the many open events: 2,000 citizens, 1,500 families, 1,800 young people and university students.

something by making choices that affect not only our lives, but also that of others: producers, workers, those who live in a certain area, future generations and that even in our small way we can choose quality products, opt for companies that respect workers' rights and the environment and avoid waste.

Among the laboratories that developed these themes certainly those that stand out are *How many things… WorkSHOPping!* (2016 edition), *I buy things…Therefore I am!* (2016 and 2017 edition), *Refuse or reuse?* (2017 edition) – held in collaboration with the CONVOI non-profit cooperative – which have analysed in depth the general theme, stimulating reflection on the role of the consumer, or better consumer-actor (Fabris, 2010), who chooses on the basis of his own wishes and no longer only his needs; they talked about compulsive shopping, an extremely topical subject for adolescents; they also tackled the theme of the reuse of waste in creative, practical laboratories.

Other events, on the other hand, were aimed at making children and adults aware of some social problems and in particular the transformations of an increasingly intercultural society, where the boundaries between people as well as the different cosmologies of objects - also coming from cultures remote from ours -, do not disappear but interact with each other:

Also on this subject were the workshop *Amo non amo*: *what can you do with a ball?* (2017 edition) inspired by Anna Baccellieri's book, which gave an insight into the differences that exist between children around the world, some who can play with a ball and others who simply don't have the time and are often employed in making toys that they will never use. Two very important exhibitions were organised on the same subject, both of them held in the main halls of I Gigli Shopping Centre. One is the exhibition "Work Right!", in collaboration with the International association Poster for Tomorrow, which has supplied 100 posters, by graphic designers from al l over the world, winners of the competition dedicated to the Right to Work; an exhibition with a great visual and emotional impact that explores the theme of the second edition of the festival, "the work behind things". Lastly, a very important project, the exhibition "Le Cose degli Altri", in collaboration with Caritas Florence and 3 reception centres for refugees in Calenzano, Campi Bisenzio and Sesto Fiorentino, comprising portrait photographs of people seeking asylum in this country, accompanied by their life stories and the story about a particular "thing" that for the people interviewed represents their "home".

These objects of affection were then represented through their absence in the photos, filled with illustrations depicting the most similar possible version of the objects left at home or lost on the journey.

On this project apart from the exhibition there was the meeting Things from the sea, to discuss with experts and people directly involved the drama that many people have to suffer, people fleeing from wars and famine in search of a better future. At the end of the meeting, thanks to Giulio Carlo Vecchini, luthier, who made a guitar -- *Mare di Mezzo* – using

the fragments of the boats that arrived at Lampedusa, giving life to an evocative concert for guitar and voice.

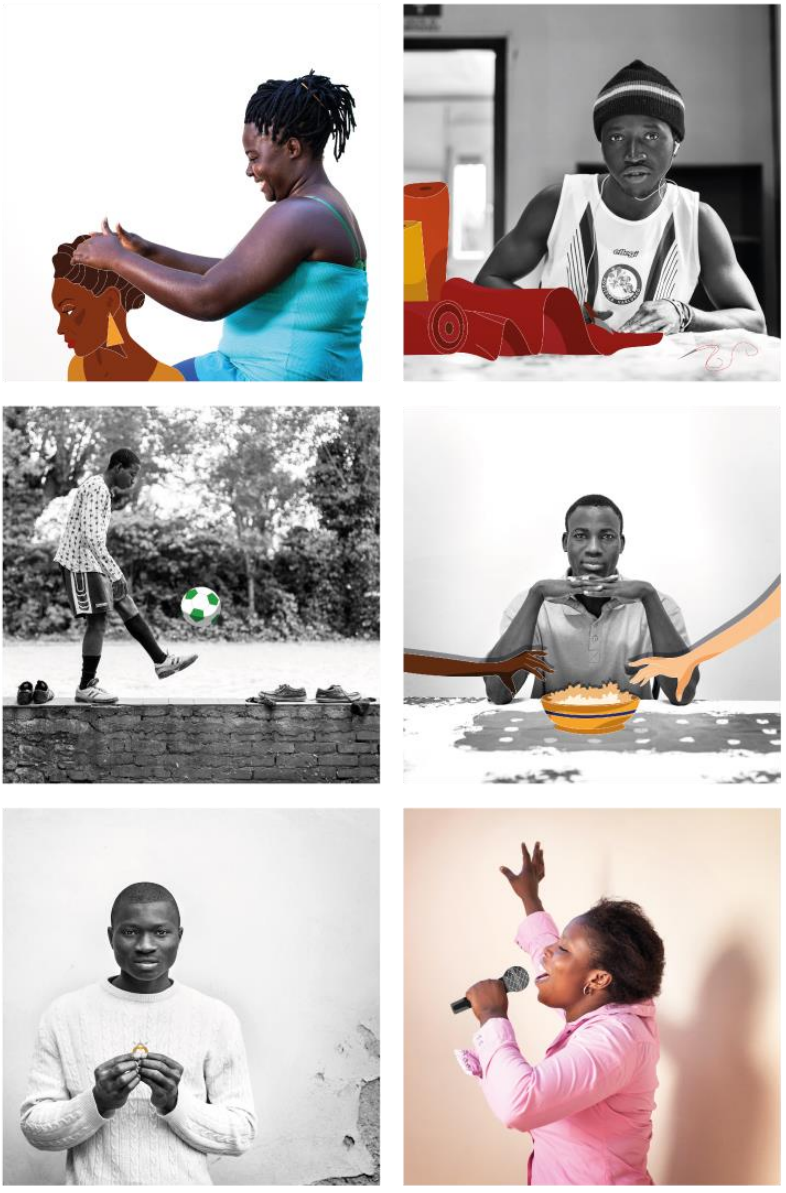

Figure 2. Selection of some photos protagonists of the photographic exhibition "Le cose degli altri".

Still other events were aimed at making known and reflecting the reference territorial context, through meetings and exhibitions relating the thousand forms that work takes today: from the craftsmanship of the artisan to robots, through visits to factories, events and meetings in collaboration with companies, associations such as ADI Association for Industrial Design or Artex.

It can be claimed that the main characteristic of the COSè Festival is that it is an “open festival”, in that in the two editions it succeeded in involving dozens of actors present in the area. It had an important role because it increased the level of social aggregation within the event in a territory through culture and creativity in a dimension that was not that of "selling", to which the many events scattered in our territories have accustomed us, such as festivals and fairs and cultural events mainly used as a tool to promote tourism and trade.

Figure 3. Merchandising COSè Festival.

Certainly most of the events have been designed to address a public of children, seen as the users who could learn the most important topics for the future and put them into practice as they grow up. This is above all through play, as the basis for the teaching methodologies aimed at the world of childhood, as the child learns spontaneously, free from any constraints, becoming in some cases himself the creator of the game. In addition to this didactic and pedagogical character, play has always played a cultural role too, as through games and toys it is possible to trace a story from one era to the next, of the type of relationship between adults, children and society. *As La Cecla also underlines:*

> "Games, toys […] tell us about the image that adults have of children, the idea of children's 'task' in society. Of course, children also play alone; they invent ways to play with the world on their own, but adults 'take advantage' of the seriousness of child's play to guide it along the channels of what they expect from children. In this sense, toys are the matter of a relationship between two categories of humans who, although 'familiar', are foreign and divided. "(La Cecla, 2013, p. 62)

In the current transformation period, in which the relationship between adult and child must also be reviewed, it is fundamental to understand the importance of children's ability to "play with the remains of the world to recompose it in their own, new way" (La Cecla, 2013) which can become one of the truly innovative strategic levers to rethink the world of the future. Precisely because of the experience gained during the COSè Festival, we have understood that through some play-workshops it is possible to promote children's creativity and re-establish an adult-child relationship based on new principles; the smaller ones learn by playing and the older ones begin to reflect on a different future. So if for the little ones the "world of things" is approached in an exploratory way, for adults it is approached in a reflective way. In fact, the child explores the multitude of things in his objectivity; the adult instead reflects on them following more complex and elaborate processes. However, the form of learning that most characterised this festival experience and that was interesting in terms of social impact was that among peers, in which the child - as a social innovator - challenges the world as the adult has always known it. The child then poses questions to the adult that he had never thought of and cannot answer. In fact, the child can play this role of destroyer of schemes" because he lacks models inherited and / or imitated from the social context in which the adult is already immersed, and perhaps contaminated.

Figure 4. Laboratory "I materiali delle cose" (2016 edition), on the themes of Sustainability: environmental, economic and socio-cultural.

The COS'è festival therefore set itself as a tentative to catalyze and direct, through a Design Driven strategy, the energies and the various actors present in the territory in a sort of common platform of capabilities of individuals and society for the production and circulation of knowledge on the one hand and identity construction on the other. The visits and the involvement of manufacturing companies or other entrepreneurial entities ascribable to social entrepreneurship, the involvement of public institutions have in fact constituted an important attempt to give identity and meaning to the many "non-places" spread throughout the territory as is the emblematic case of the "I Gigli" shopping centre, the main sponsor of the Festival, which has become the theatre of exhibitions with a high social content and educational and recreational workshops that have involved " I Gigli" customers.

The festival therefore becomes the tool not only to produce tangible and accessible value, but also to generate aggregation, through participatory and formative processes, aimed at stimulating the community, understood as the set of bodies, structures, companies and people. It is an example of how it is possible to concretely try to activate, or reactivate, territorial networks that in some cases exist on the territory but that very often unfortunately find themselves with their nodes disconnected from each other, placing a small piece in trying to intervene on global problems that in one way or another affect us all.

About the Authors:

Author 1 Debora Giorgi is Associate Professor of Design at Department of Architecture, PhD, Architect, with a Masters in Eco-sustainable Architecture from the Faculty of Engineering of the University of Bologna. Since the university years she has been interested in issues related to Local Sustainable Development and the social implications of the project. Expert in the field of social design, service design and user experience, she is leader of several research at international level. For over 20 years she has been involved in several international projects as an expert and project manager with the most important national and international institutions.

Author 2 Irene Fiesoli is a Designer and she has a Post-Doctoral Fellow at the Department of Architecture DIDA of the University of Florence (Italy). She is involved in research activities at national and international level at the Department of Architecture DIDA, University of Florence, specialising especially in the sectors of Industry 4.0 (Digital Design), Strategic Design for territorial systems, Sustainable Design and Social Innovation Design.

Abstract | Space and service design is an emerging discipline, triggered by contemporary social-cultural-economic challenges. Shifting from traditional spatial emphasis, the focus is on the user-centeredness and systems of spaces and services, addressing touchpoints as spaces, communication systems, objects and the intangible scenarios, interactions and experiences. Comparative literature research revealed that existing service design methods and tools were found to provide insufficient responses to the combination of space and service. Through maximum variation sampling a taxonomy system for service spaces and tools simultaneously addressing service and spatial touchpoints was developed and provides critical reference points that allow for comparison of the situation pre-intervention and analysis of the intended effectiveness of the adapted situation. Finally, the article describes a space and service design process of "the Make Learn Space" for the city of Leuven, a project in line with two societal innovation challenges, namely Design for New Learning Environments and Design for Circular Economy.

KEYWORDS | SERVICE DESIGN, DESIGN METHODOLOGY, SPACE AND SERVICE DESIGN, SOCIAL INNOVATION, CIRCULAR ECONOMY.

1. Introduction

Contemporary social, cultural and economic challenges such as ageing and social inequality to ecological and technological changes have encouraged designers worldwide to reflect on their roles, approaches and their responsibilities regarding these topics. Space and service design is an emerging discipline, triggered by social innovation and focusing on these contemporary social-cultural-economic challenges through design (Fassi, Galluzzo, & De Rosa, 2018). Shifting from a traditional spatial emphasis in design towards a user experience-centered approach, the discipline aims to offer added value for the users of service spaces and contexts (Felix, 2011 a and b; Stickdorn & Schneider, 2010; Van Geetsom, 2018; Tu Ngoc & Fassi, 2018). Research has suggested that, for users, services and goods or touchpoints are inseparable (Penin, 2017) thus the priority should focus on the design of a system of spaces and services that jointly meet the needs of the stakeholders as well as individuals, clients and communities (Ou, Wang, You, Tao & Liu (2017). Throughout the design process, designers equally address the touchpoints – including spaces, broader context, wayfinding, communication systems, furniture, objects - as the intangible scenarios, interactions and experiences (Van Geetsom, 2018).

Since 2014, Thomas More University of Applied Sciences in Mechelen, Belgium, offers a postgraduate in Space & Service Design that combines the design of spaces and services. Utilising only real-life projects that involve real clients and users, an authentic learning experience responds to the demand of predominately local or regional partners by improving their service spaces and user experiences. Over the past five years a design thinking methodology has been developed, based on service design methodology; combining participatory, multidisciplinary, user-centered, interaction and social design approaches.

Educational practice and ongoing empirical research revealed that prevailing service design methodology and tools provide insufficient responses to the transdisciplinary approach (Hormess, Lawrence, Schneider & Stickdorn, 2018; Fassi, Galluzzo, & De Rosa, 2018; Collina, Di Sabatino, Galluzo & Mastrantoni, 2018) of spatial design and service design. While working on these projects and appraising the initial spatial situations and user-scenarios, the need arose to provide more instruments - including tools and the methods to apply them - to aspiring designers and professionals. Like many design challenges, the multiple layered space and service design projects involve many stakeholders and disciplines and deal with wicked problems (Buchanan, 1992). The creation of a taxonomy system for service spaces and the creation of applied design tools are particularly relevant in space and service design projects (Fassi, Galluzzo & De Rosa, 2018). These address the supporting touchpoints of the services and assist the designers and aspiring designers in holistic complex problem solving (Buchanan, 1992).

This paper describes the development of a new space and service design taxonomy model through maximum variation sampling. The taxonomy model supported the development of

more suitable tools and facilitated the choice of the tools for the design of services and spaces. The goal was not to provide more tools –more of the same- but to create tools that offer practical advice regarding the research process and therefore also the learning process.

2. Methodology and goals

2.1 Limited tools and undefined baseline situations

In the interdisciplinary approach of space and service design, spatial design is no longer considered as designing well-shaped containers but as an essential element; as important as the design of the services and as important in supporting organisations, people and activities (Felix, 2011 a and b). Spatial design stimulates the ongoing use of intangible services and it is these tangible features that evidence the existence of the service. The spatial service system identifies the services and defines the scenarios for continuous interaction between people, spaces, objects and communication tools. These evidence-based and holistic designs of spaces, objects (e.g. furniture), communication tools and services are jointly capable of fulfilling the user's need (Van Geetsom, 2018).

The conventional spatial design process follows the Double Diamond model (British Council, 2015). In service design, key attributes and specific tools are applied to each phase (Felix, 2011; Vezzoli, 2014; IDEO, 2015; Thoelen, Cleeren, Denis, Peters, Van Ael & Willems, 2015) in order to facilitate the investigation of design solutions that support complex challenges. While developing educational methodologies and practices for space and service design, tools and methodologies that were potentially appropriate were investigated. The research question "Which tools can facilitate the phases of the design process and include both spaces and services?" related to the final goal of the research: to use integrated space and service design tools and methodologies that simultaneously incorporate the tangible as well as the intangible features of a service, and will guide designers throughout the entire design process.

Because various effective service design tools and toolkits exist, a comparative literature research of service design tools (n=32) was conducted. Toolkits supporting the complete Double Diamond process, literature about service design methodology and the application of specific service design workshop approaches were examined. Analysis proved only a small number of tools considered "spatial context" as an essential touchpoint. While an existing service space always hosts an existent service (Penin, 2018; Fassi, Galluzzo, & De Rosa, 2018) the examined service design tools offered little opportunity to evaluate or elaborate on existing tangible service contexts and none carried the spatial data through the entire Double Diamond process.

Drawing from literature, the service system design is seldom explicitly incorporated into conventional interior design, interior architecture or architectural design methods, though

social design, user-centered design, co-creation and participatory design are often used in contemporary design project of public spaces and buildings (Di Prete, Crippa & Lonardo, 2015; Poot, Van Acker & De Vos, 2015; Camocini, Petrillo, Rebaglio, 2015; Lucas, 2016; Wagne & Watch, 2017). Although these are all also approaches or characteristics of service design, there is little explicit reference within the vocabulary of architectural or interior design to that of the design of services.

The literature review concluded that prevailing service design toolkits that address a complete service design process provide inadequate responses to space. In addition, the methodology for spatial design projects offers no explicit and structured approach to managing spatial and service design simultaneously.

2.2 Testing and developing

The following step in the research process was the selection and testing of existing tools which addressed the space as well as the service and to appoint them to specific phases in the Double Diamond process. Existing tools were adopted, and the aspect of “space” was added. By testing the tools, new challenges emerged: which tool is appropriate for which situation? By working with real-life clients, public service organizations and NGO’s, the baseline situation of the project was often different. Sometimes the organisation already operates in an existing building, thus the spatial context causes limitations and constraints. Sometimes the organization already offers services and sometimes they do not. Applying the correct tools, then, is not always self-evident. One needs to research the tangible and intangible contextual situation in order to be able to define the design challenge. Next to this, design briefs also begin from different starting points and thus require different methods and tools (fig. 1). If the design of space and service design go hand in hand (Collina, Di Sabatino, Galluzo & Mastrantoni, 2018; Fassi, Galluzzo, & De Rosa, 2018), how these different baseline situations be distinguished?

To gain a better understanding of divergent baseline situations of design projects, a comparative analysis of 25 space and service design requests was conducted. The methodology for the baseline assessment of service contexts provides information on the situation the design outcome aims to change and provides critical reference points that enable one to compare the existing situation to the effectiveness of the adapted space and service. In order to select and adapt existing service tools and to create new ones, it was necessary to apply tools that were responsive to the initial service space situation.

From 2014 till 2020, the Design Department of Thomas More received 25 relevant design requests from public services and NGOs for service and spatial design challenges for public and semi-public buildings, spaces and contexts. Through maximal variation sampling (Creswell, 2015) four types of baseline situations were distinguished from these 25 requests.

The methodology to determine the essential baseline situation of the service context, was named the Taxonomy of Service Spaces. The next part of the paper describes different baseline situations and illustrates them by design projects examples.

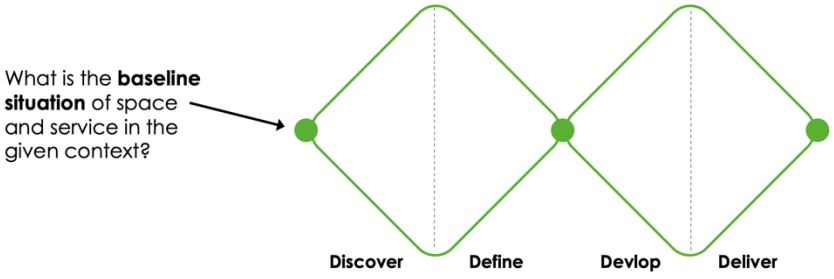

Fig. 1 The unsecure starting point in The Double Diamond design process model (British Council, 2015).

3. Space & Service Design taxonomy

3.1 A space and service exist

The Taxonomy of Service Spaces is an analysis method to overcome the indetermination of the space and service design context and problem. Before the Double Diamond's first diverging phase "discover" begins, the following questions are asked: "Is there an existing building that needs to be used?", "Is there a certain space or specific spatial objects that should be used?", "Is there a specific outdoor area that was determined?" If the questions are affirmatively answered by the (future) service provider (fig. 2), the next question is suggested: "Are there already services offered in the allocated space that need to be taken into account?" If this is the case, the current spaces and services need to be examined, evaluated and improved or expanded.

Six projects (n=6) were identified that had a baseline situation with existing tangible components and intangible services. In these cases, the service provider operated from an existing building, offered existing services and wished to improve both or complement existing services with new ones.

In 2018, the elderly community WZC De Lisdodde[1] in Mechelen asked to design outdoor services and experiences for their residents in order to stimulate them and support their health as well as offering them a platform to interact with fellow residents, neighbours and a neighbouring school (photo 1 and 2). This project illustrates the baseline situation with an existing site and the position that designers must take existing services into account.

Photo 1 and 2. Existing space and existing services: Space & Service Safaris for and pitches with and for the residents of Elderly Community De Lisdodde (2018).

3.2 Existing space but no services

A service provider can be in the possession of a space, but the necessary services and scenarios must be designed from scratch and the designated spaces, objects and communication tools, must be evaluated and adapted to the requirements of the service, the service provider's expectations and the needs of the users.

The majority (n=12) of the design assignments for public service organizations and NGOs were found to be in this situation; the client was in the procession of a building and wanted to develop appropriate services for a specific target group in order to respond to a specific social need.

[1] https://delisdodde.zorgbedrijfrivierenland.be/

Figure 2. Baseline situation within a designated space (Van Geetsom, 2020).

In 2018, the NGO Ekisande2 requested to design the services and transform an existing school building into a health care centre for a local rural community in Bwera, Uganda. The building initially accommodated educational services and a primary school, but with the success of the NGO, there was a growing number of pupils and a new school building was being built. This in turn provided an opportunity to use the former school building and the site around it to provide health services that were lacking in the area of Bwera. This brief called on space and service design students to organise these newly developed health services and experiences on this site. (photo 3 and 4). This project was an example of an existing building which had no existing services. The selected student project will be executed in Uganda in 2020.

services for Bwera, Uganda - Design: Verbeke, P. (Belgium), Verhas, E. (Belgium) & Liu, Y. (China) (2019)

3.3 No designated space or objects, existing service

Another baseline situation that occurs is that there is no designated building, assigned room or touchpoints, nor an allocated outdoor space within the broader service context. Here, the same questions as in the previous situation will be posed: "Are there already services offered by the service provider?" In this situation, current services need to be investigated, assessed and improved.

According to the analysis of the 25 design requests, two service providers (n=2) showed the need for tangible objects to make their invisible services visible and required the creation of touchpoints in which users/users and users/service providers could interact. The service providers lacked physical elements in the environment which would evidence their existing service.

A sample of this baseline situation is the project for the organization Community Building[3], a social non-profit organization financed by the Province of Antwerp. Assisting socially disadvantaged families in legal, housing, financial and educational issues, one of their goals is to inform families about the importance of going to pre-school in Flanders as research suggests that beginning school at a later age leads to learning deficits. Their existing door-to-door information sessions lacked tangible features they could use to help explain what going to pre-school education could mean to families who often do not speak the local language. In 2016, space and service design students designed touchpoints that evidenced the service and extended it by use of new service venues and user interactions (photo 5 and 6). The project was executed and is currently in use.

3.4 No designated space or objects, no existing service

The last baseline situation is one in which there is no determined space, nor a developed service. In this case an organization or start-up wishes to establish a service, hence there is a need to assist with the development of the service and the relevant touchpoints. These touchpoints can be places, spaces, objects and communication elements. In the service case survey of 25 space and service design requests, five projects (n=5) were in this situation. The broader spatial context was determined e.g. the city of Leuven, the urban context of the Gandhi neighbourhood in Mechelen.

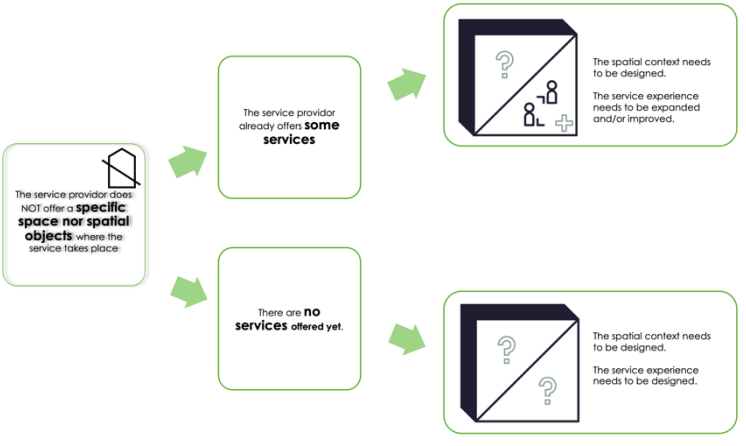

Figure 3. Baseline situation without designated spaces (Van Geetsom, 2020).

Characteristically of this baseline situation, the governmental organization SOM[4] (SamenOnderwijsMaken/ TogetherMakingEducation) formulated a general space and service design idea for the city of Leuven in 2018. Their wish was to enhance the talent development of young children and simultaneously stimulate the awareness of their talents and self-confidence. However, there was no designated space besides the broader city context of Leuven and there was no previously designed service or experience. One of the requirements was to make the future service tangible in the urban context and to share the young people's talents (photo 7 and 8).

Photo 7 and 8: No service | no spatial components: Design for talent development in the city of Leuven – Design and photos: Verbeke, P. (Belgium) (2019)

3.5 The baseline situation influences the choice of tools

Once the baseline situation is determined, the design team can select the suitable tools for the different phases of the design process: design problem discovery, design challenge definition, the development phase and the delivery phase.

Design thinking tools are used to find, in a structured and effective way, solutions to wicked problems (Curedale, 2017) but should leave enough freedom to be creative (von Thienen, Meinel & Nicolai, 2014). In the Double Diamond method (Design council, 2015), divergent thinking and converging thinking is used twice. By broadening the spectrum and gathering as much information as possible about the context and existing services and experiences, critical analysis of this data can be continued in the second phase. This results in re-formulating the design needs and the relevant design challenges. These core values form the

[4] https://www.samenonderwijsmaken.be/

basis for diverging again; in search of varied user-centered solutions, the last convergence heads towards the final, appropriate, tailor-made and preferably tested outcomes.

In case of an allocated building and existing services, in the first phase both the tangible situation and offered services need to be examined as well as the relationship between both. Methodologies such as observations and service safaris explore and examine tangible features and intangible services prove to be very useful. The data is visualized by context maps and storyboards appointing qualities and shortcomings of both the tangible features as well as the intangible services.

Checklists enumerating all essential aspects of the design of services and spaces can help to avoid gaps in the investigation of such complex projects. Common data about the building's dimensions and proportions, construction and techniques, the existing/ available/ sustainable material and the site orientations and buildings' views can be investigated through traditional methods such as observations and measuring.

However, other elements correlate with service design: the history of the building and users, the surrounding buildings and organizations, the circulation and organization of functions, the current and possible users' profiles and their ergonomic and health-related requirements, the relationship and interactions between the different users and between users and the site, the existing problems and needs of the user(s) towards the context, the underlying needs of the (future) user(s), the legal requirements afflicting users and building, the current organization stationed in the context, the current and future stakeholders…. Tools which identify and bring into view both the tangible and intangible are required.

The following section of this paper describes through purposeful sampling (Cresswel, 2015) an empirical study of a Space & Service Design students' design process, through a real-life, participatory project for the public service Making Education Together (SOM) organisation of the city of Leuven; the 'MakeLearnSpace'.

4. Purposeful sampling: a circular urban learning space

4.1 Towards circular city laboratories: a MakeLearnPlace for the city of Leuven

SOM (Making Education Together) is a partnership between diverse educational platforms of Leuven and together they create diverse solutions for the challenges of today and tomorrow with a specific focus on education with the intention that every learner can develop and use their maximum potential. Via a MaakLeerPlek (MakeLearnSpace), a workshop, inspiration and inter-generational meeting place, people in Leuven can share spaces, materials, ideas and knowledge. The MaakLeerPlek offers the physical and mental space to the learner in order to develop and influence their personal learning process. The workshop and meeting place must be an open and easily accessible area that accommodates a programme which goes beyond sectors, roles and structures and which starts from societal challenges (SOM, 2019).

Being part of an estate project, the space and service design project will be only temporarily hosted by the Vanorshoven Mills and Silos (photo 9 and 10), a former and iconic industrial building in a new and vibrant urban development area. After three to five years, the service and touchpoints should be able to be relocated to other venues within the city. Therefore, and following the organization's vision, the required project outcomes should be socially, environmentally and economically sustainable and circular; comprising of modular and circular furniture and spaces, communication and information systems.

Photo 9 and 10. The Vanorshoven Mills and the Silos (source: SOM, Leuven)

4.2 Application of the taxonomy

Utilising the Taxonomy format, one could conclude that the client and future service provider designated a building and offers no services yet on site. Although the site is only temporary, future user experiences and supporting touchpoints should be developed in such a way that they can be organized in the current buildings. At the same time, the circular spatial appliances and service systems should allow for transfer to other locations in the city.

During the Discovery phase, nine student teams investigated the current tangible and intangible context starting from the position that the spaces were determined and that only the preliminary goal of the client existed regarding the services. The research question concerning the status of the tangible and intangible context was divided into nine sub questions: addressing the current tangible interior/exterior spaces, the broader city context, the current vision, organizational structure, services and stakeholders of SOM, the experience, perception and the future expectations of by-passers, best practices of urban learning services and urban learning spaces, circular economy theory and concepts.

The nine student research teams conducted research of design and research for design (Van Geetsom, 2016); looking to the design challenge from different perspectives through both field and desk research. The client, experts and teacher-researchers participated throughout the four development phases.

In the period of Discovery, student teams gathered insights by experiencing and measuring the site and surroundings. They captured qualities and shortcomings concerning the current built space, dimensions, functions, orientation, ergonomics and accessibility, wayfinding, user traffic in and outside the building, the inter-action with the nearby surroundings, (public) transport, city hotspots and wayfinding. In order to guide the transdisciplinary (Fassi, Galluzzo, & De Rosa, 2018) design process and to obtain a holistic and complete view of the project, the teams were asked to use existing service design and spatial design methods and new Space+ServiceDesign tools that emphasise space and service simultaneously (Table 1.). At the same time, the theory of circular economy and design was studied in order to ground this position within the project within the Ideation and Development phase.

The second phase defines the real design challenge, taking the qualities of the current situation into account. Nine international and multidisciplinary design teams were formed. By analysing the previous results, using convergent thinking, the teams' main targets and key factors for success were set and presented to the client, stakeholders and experts in the domain. Which current and future stakeholders and users should be addressed? Which services should be created? Which spatial and communication elements should be kept, improved or invented?

Going through the third quarter, the multidisciplinary design teams investigated different solutions and options; thinking broadly. They applied brainstorming and braindrawing, testing and modelling. To guide them on circularity, they used the mirror of the Circular Economy Butterfly diagram (Ellen MacArther Foundation, 2017) to define objects, build elements and service systems. They pitched the design concepts to the client, stakeholders

and experts and iterated previous designs and compared their ideas with the pre-set requirements in the Definition phase.

Table 1. Designated space/no determined service: Baseline situation research and S&SD tools options.

Phase	Discover	Define	Develop	Deliver
Tools and output	SSD Resources SSD Interview tool SSD Current user's mood boards SSD Current user's experience SSD Current space vs time tool SSD Giga-mapping SSD Current stakeholder map SSD Cultural probes box *Plans, pictures, video/3D-model* *Service safari* *Case study and market research*	SSD Priority charts SSD Design challenge SSD Future personas SSD Future stakeholder map SSD Future user's mood board *Design team canvas* *Project agenda* *Word cloud, mind map*	SSD Future designer's mood board SSD Future user journey *Business model canvas* *Prototyping/mock-ups/video*	SSD Spatial service system map SSD Service space touchpoint matrix SSD Future user journey SSD Future personas *VR-experiences, plans, elevations, 3D's, models, video* *Mock-ups of touchpoints*
Characteristics	Period of discovery, gathering inspiration and insights, identifying site, visitors and needs, seeking content information, gain knowledge and acquire inspiration about the specific topic.	Analysing the research results, defining key elements and major design goal.	Period of ideation, various options to solutions are investigated, pitched and iterated.	Delivery of the final result by defining the tangible and intangible features of the S&SD, different steps in the realization, using adequate and user-centered visualization tools.

Finally, the design teams delivered nine finalised space and service design solutions. They envisioned the future personas and stakeholders, the spatial service system, the interactions between touchpoints and users and among users. The teams visualized the pre-service, service and after service in customer journeys within the available spaces. They offered narratives about future spatial scenarios, models, mock-ups of touchpoints and VR-experiences aiming at offering the client realistic estimations regarding the intended output

and emphasised the difference between *what is the space looking now* and *how it will be used in the future*. Technical plans, specifications and road diagrams proved the technical viability of the project and allowed the client to make the next step; the execution of the project.

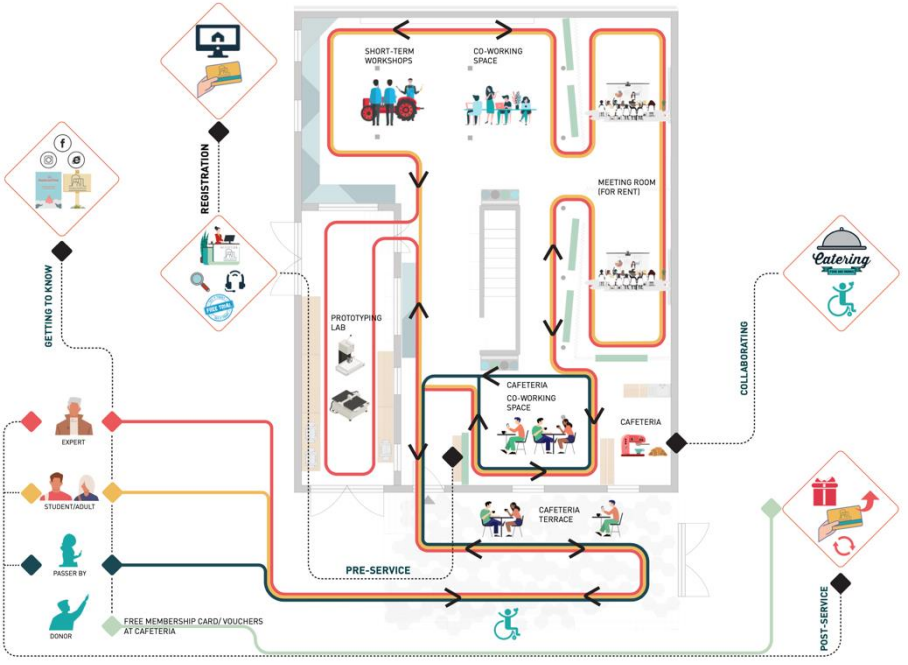

Figure 4. Spatial Service System Map – Design: Bui, A. (Vietnam), Mols, A. (Belgium) & Hamaway, C. (The Netherlands) (2020).

The screening of the student outcomes revealed that out of the nine team projects and based on the circular economy theory and the Butterfly diagram, one project succeeded in designing circular objects. Two projects reached the level of designing circular objects and circular spaces and six projects offered circular spaces, objects, services and systems. Students' feedback revealed that even stronger process guidelines and checklists would help to generate the best overall solutions. Next to this, it was suggested that adding extra layers such as circular economy, inclusive design, project budget, legal requirements make a wicked design challenge even more wicked.

Conclusions

Spatial design has evolved into a Space and Service Design field with new applications and social-cultural-economic interpretations. Through empirical research, educational practice, experiments on methodology and application of tools, and through extensive participation and feedback of numerous stakeholders, a new design culture in the field of spatial design and service design has been established.

The course referred to in this paper responds to the needs of regional, real-life partners by improving their service spaces and user experiences. Over the past five years a specific design thinking methodology has been developed. Based on service design's as well as spatial design's core characteristics, it combines participatory, multidisciplinary, user-centered, interaction and social design approaches. Using the Double Diamond as a reference, the methodology addresses both space and service and provides (student) designers a strategy to respond to complex baseline situations and design challenges. Users are able to specify the baseline situation and articulate the needs of the client, users and space. By distinguishing what is there and what is not there, it provides designers a starting point and guidelines that allow for the delivery of a complete design response to both the space as well as the service needs.

In ongoing research, new tools were and are continued to be developed to respond to identified gaps. The final set of tools will incorporate references to existing suitable tools but also offer new guidelines that will guide the designer through the space and service design process. In closing, Space and Service Design is a young and emerging discipline and requires ongoing research, experimenting and further feedback from the design field and clients about the effectiveness of methodologies and tools related to different situations.

Design education and forest environments – learning from and with living systems

Dr Caroline McCaw,

OTAGO POLYTECHNIC SCHOOL OF DESIGN
caroline.mccaw@op.ac.nz

Abstract This paper considers two design student projects at Otago Polytechnic, Dunedin, New Zealand completed in 2019 in partnership with local environmental groups, who are environmental kaitiaki (guardians) of local forests. Both projects required empathy including and beyond human-centered design. Design students were compelled to listen and learn carefully, working with the needs of others, including the non-human. Students became part of a local community – and shared forest experiences – in order to see through the eyes of others (including birds) and to craft communication design responsively. This paper considers forests as integrated ecologies in which humans are always implicated, and considers how design processes may potentially expand and grow as responsive living systems, so that designers (and design educators) may become more conscious actors in the world.

KEYWORDS | MORE-THAN-HUMAN CENTRED DESIGN, LANDSCAPES, DESIGN AND ECOLOGIES, PROJECT-BASED LEARNING

Introduction

In 2019 two groups of senior communication design students at Otago Polytechnic in Dunedin (New Zealand) engaged with design projects in partnership with two local environmental organisations. The projects required us to go outside – to learn in, from and with – our local forests and their designated caretakers. The results of these projects included a high level of student engagement outside the classroom, and in some cases the development of useful outcomes for the host organizations. As a teacher these projects helped me to reflect on the value of developing relationships through design.

In this paper I will first briefly describe the two projects, and use some examples from student project outcomes to illustrate the kinds of engagement we had as a result of working with these two local communities. I will then consider the models we use for thinking about and teaching design and reflect on contemporary theorists from outside of design. These will be drawn together to consider how projects such as these might help design theories grow as responsive living systems, so that designers may become more conscious actors in the world, as Stuhr-Rommereim and Day suggest "interwoven with our environment" (Stuhr-Rommereim and Day n.d).

Project 1: Town Belt Kaitiaki

According to *Te Ara*, New Zealand's online encyclopedia:

> " Town belts are large tree-filled wilderness spaces that encircle cities and are, in theory, protected from development. Though the idea of town belts emerged in Britain in the early 19th century, the first ones were created in the new settlements of Australia and New Zealand in the 1830s and 1840s." (Te Ara website: parks and gardens)

Unlike most other cities in New Zealand, Dunedin's Town Belt is relatively intact, and is comprised of 202 hectares of forest and sports grounds in the central urban area of Dunedin and across several suburbs.

Dunedin's Town Belt Kaitiaki is a collaborative, student-led education programme for local schools and early childhood centres. Currently there are 15 schools and centres who are located nearby the Town Belt and participate in the programme. *'Kaitiaki'* is a New Zealand Māori word that translates into English as "trustee, minder, guard, custodian, guardian, caregiver, keeper, steward" (maoridictionary.co.nz 15 February 2020).

The Town Belt Kaitiaki is facilitated by an education co-ordinator (Claudia Barbirat in 2018-2019) who supports student ambassadors from these 15 schools and their use of the

Dunedin Town Belt as both an outdoor classroom and a space where they can put what they learn into practice, using a collaborative community education model for conservation[1]. The school children and teenagers meet regularly. They have developed a vision for their role as kaitiaki of the Town Belt and have embarked on a number of student-led projects. According the Dunedin City Council website "[projects] range from advocacy of the Town Belt, improving recreation opportunities, monitoring wildlife and predator trapping…The purpose is to help young people to value and understand the significance of the Town Belt and its *mauri* (life force) and learn to sustain and care for the environment." (Dunedin City Council website 12 December 2019).

The Communication Design programme at Otago Polytechnic uses a 'project-based learning with communities' approach, where teaching and learning about design is paired with live community projects, engaging primarily with social and environmental organisations. In this way formal learning outcomes are embedded within project design. Students engage in work-based learning, and develop professional social skills alongside their design literacies. The results often demonstrate both broad and deep learning, in a process that is shared. Client organisations learn about their own design needs and about the design process while students (and teachers) learn about their client organisations' work and communication needs. The learning conversation allows for multiple perspectives. Our senior students report feeling confident and prepared for work at the end of their degree, having several live projects in their portfolio, and an extended range of experiences such as facilitating relationships, conducting research, development and design to both prototype and final handover stages. The Town Belt Kaitiaki project fitted well within the kinds of projects we work with, and included the added challenge of having children and youth as stakeholders.

The project began with research. Many of our students had never heard of the Town Belt, and their first task was to go out and explore it. We developed maps of our collective experiences before meeting with a group of Town Belt Kaitiaki (TBK) student ambassadors, and used these maps to discuss experiences related to specific sites, listening to the group's aims and current projects. Our clients ranging in ages from 8-17, articulated their work, and together we identified a range of design outcomes that our students could develop in partnership and prototype, and could be usefully employed by the TBK in achieving some of their aims.

[1] A collaborative community education model for conservations found in a few other centres around New Zealand, including the successful **Kids Restore the Kepler (**https://www.kidsrestorethekepler.org.nz/) and **Kids Greening Taupo** projects.

Figure 1: Experience maps are part of the Discover phase of the Double Diamond model

Listening, empathy and respectful language were required when we worked with the ambassadors as they became 'project partners'. Design students used a design thinking process to better understand the needs of the group. The Double Diamond process was developed by the British Design Council in 2005. It follows the four phases – Discover, Define, Develop and Deliver.

For this project, design students spent their course time conducting site visits, developing experience maps, making historical and design research, and developing agile responses to the brief. Some of the projects completed the Double Diamond where they have managed to iterate, test and design a refined design outcome that the TBK have used, such as a logo and brand story. But most of the design student teams finished a low-fi prototype including paper and online maps, wayfinding solutions, classroom resources for teachers of 3-7 year olds, a guide for social media engagement and an event management toolkit. Many of these were user-tested at a TBK student ambassador *hui* (gathering) and with schools. Through the ongoing iteration of design outcomes, design students were encouraged to revisit sites throughout the Town Belt, and consider what they too had learned through first-hand experience that could provide ideas for the ongoing design conversation.

The design prototypes became 'thinking tools' or ways for both students and partners to communicate sites, experiences and opportunities with each other and with others. In the process of working together in this way we all learn.

Figure 2: TBK student ambassadors workin on website wireframe ideas with design students

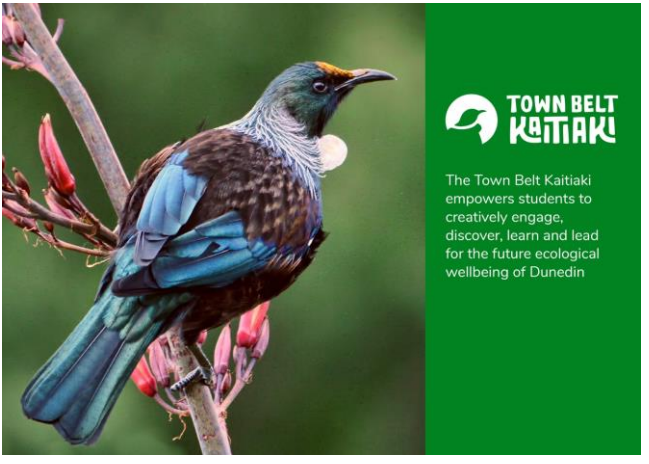

Figure 3: Tui was the native bird chosen to represent the Town Belt Kaitiaki, as it is a territorial song bird, guardian of the forest. The resulting brand and design outcomes are centred around concepts of guardianship (kaitiakitanga). This core value is supported by empowerment (whakamanataka), caring (manaakitaka) and education (matauranga) for the future of the Town Belt. Original image (left) from franzjoseftours.com, Student logo (right)

As a result of our designs the Town Belt Kaitiaki student ambassadors have formed a stronger and deeper understanding of their purpose. The project enabled stronger

engagement with other members of the community (Department of Conservation, Signal Hills Studios and all the participating schools) and has activated a new sense of togetherness, empowering the TBK ambassadors in their mission and vision.

Evaluation from both Town Belt Kaitiaki co-ordinator Claudia Barbirat and TBK student ambassadors was very positive. “The most amazing collaboration yet! The project meant so much to TBK and was so in the spirit of our programme.” *Claudia Babirat, TBK education co-ordinator*. Similarly design students felt educated and empowered through the collaboration. “I’ve lived my whole life in Dunedin, but I never heard of the Town Belt until now… the difference with this experience is working with young clients. We were learning together.” *(Student course evaluation)*

The project required listening, observing and finding opportunities. Alongside this, students engaged in developing environmental, cultural and social literacies, an entrepreneurial mindset, and interpersonal skills. Through engagement in this project design students begin to understand themselves as members of the local community with responsibilities for ongoing action, through their increased environmental and cultural literacy. TBK’s values became the designers’ values, including guardianship (kaitiakitanga), empowerment (whakamanataka), caring (manaakitaka) and education (mātauranga). The project required design students work outside their classroom, with others in collaborative ways, including the urban forest.

Project 2: Orokonui Ecosanctuary and The Kākā project

Prior to the arrival of humans, Aotearoa New Zealand was a site of many endemic species. As a result of the country’s long isolation from other land masses many of New Zealand’s animals and plants are not found elsewhere – including 245 species of birds[2]. (Te Ara website: plants and animals)

However the arrival of people – first the Polynesian Māori, and later European settlers – saw the demise of many of these.

> “Early European explorers and colonists remarked on the volume of the birdsong. But burning and milling trees reduced and fragmented the bush area available to birds, while introduced predatory animals depleted populations and completely exterminated some species. Around 50% of native bird species are now extinct in the North and South islands.” (Te Ara website 2 February 2020) https://teara.govt.nz/en/native-plants-and-animals-overview/page-3)

In contemporary Aotearoa New Zealand a number of ecosanctuaries – offshore island, fenced and mainland – to provide protected habitats and nesting sites for some rare and endangered species. Orokonui Ecosanctuary is one of five fenced sanctuaries.

[2] 71% of these extinct species were endemic to Aotearoa New Zealand.

> "A predator fence surrounds 307 hectares of Coastal Otago forest, pests have been removed, habitat enhanced with weed control and planting, and many rare and endangered species re-introduced." (*Orokonui website 2019)*

Orokonui Ecosanctuary is located 25 minutes north of Dunedin (and Otago Polytechnic) and is the site of another senior design student group of projects in 2019, including two design honours students. The Kākā Project was developed by design students Katherine Woodfield and Georgia Ryan, collaborating with Information Technology student Nick Mulrooney. Their project focused on developing design solutions that would help to educate local communities about behaviour and best practice in regards to Orokonui's flock of native parrots, known as kākā. Kākā are described as an indicator species (Recio et al 2016). They are vulnerable to predation, especially while on their nests, but if kākā are safe, the environment is likely to be safe for a range of other species. While the sanctuary will be safe, kākā will fly beyond the fence.

> "In 2019 it was rare for any sanctuary visitors ever see the kākā flock, because they spend most of their days outside the sanctuary, only coming back at dusk to visit the feeders. Most of the flock are tagged, but of the kākā that have hatched in the sanctuary or that the Orokonui staff are aware of, almost half of them are missing and presumed dead. This is due to impact from predators, inhospitable environments, and human interference." (*Woodfield and Ryan, The Kākā Project 2019, p7*)

The Kākā Project involved a year of research and project design, and included weekly visits to the sanctuary, meeting regularly with sanctuary staff and taking walks in the forest. The students engaged in literature and context reviews, expert interviews and stakeholder testing. Slowly, over the year, their relationships grew stronger, with each other, with neighbours and project stakeholders and with the Orokonui forest and birds.

> "Through these regular meetings and discussions, we realised the research aims of our project were how to educate, encourage and empower local communities to help local kākā thrive. Our tool of choice as designers was through interactive multimedia storytelling. … Our hope was that through applying our storytelling and design skills we would create products that are innovative, engaging, fresh and effective." (*Woodfield and Ryan, The Kākā project dissertation 2019, p7*)

Through their research and design process Woodfield and Ryan consulted with local Māori and identified important connections.

> "A Māori approach to these conservation issues provides a deeper understanding of (*kaitiakitanga*) – connections between the land and the people who live upon it. Our project needed to respect these connections, and it also needed to emphasise the

> importance of kākā, both as an indicator species and as a *taonga*[3] species." (*Woodfield and Ryan, The Kākā project dissertation 2019, p34*)

Secondly, they identified a range of approaches suitable for interactive multimedia storytelling, selecting two media and two strategies for targeted communication.

A choice-based game and website was selected for its ability to generate empathy around local contexts. This was developed using 2D assets, and modelled on a rural lifestyle property, such as those found immediately outside the sanctuary. This game was entitled 'Neighbours' to relate directly to its initial audience, those living near the sanctuary and within kākā territory.

Alongside this, a playable Virtual Reality environment was developed to encourage flow, as players were encouraged to see through the eyes of a kākā as they return to the sanctuary in the evening, and could listen to other kākā as they about their day's experiences outside the sanctuary. This was a concept or pitch, a single playable space, that demonstrated how the game could work.

Both playable screen-based experiences were designed to help local people[4] better understand the risks of their own behaviours and backyards for kākā, and how sometimes simple changes can keep kākā safe. Examples included backyard trapping to eradicate stoats, covering compost bins to discourage rats, and planting food sources the birds liked to forage for rather than feeding the birds human food such as nuts and fruit.

Research, interviews and direct experience informed their storytelling, and through regular checking and correlating information, the students assembled a variety of stakeholders.[5] This example demonstrates students making connections between published research, their first hand experiences and their proposed design-led storytelling.

> "…(this article) concludes that juveniles are more "innovative, curious and exploratory" (Loepelt et al., 2016). This is in line with the general characterisation of juvenile kākā we have observed from experts and in person. Juvenile kākā are a good example of a protagonist or main character in a game." (*Woodfield and Ryan, The Kākā Project dissertation 2019, p12*)

[3] Taonga, according to Maoridictionary.co.nz is a "treasure, anything prized - applied to anything considered to be of value including socially or culturally valuable objects, resources, phenomenon, ideas and techniques".

[4] The proposed games were targeted towards local nearby communities, through schools and hoped to be available for visitors to play at both Otago Museum and the Orokonui Visitors' Centre.

[5] Such as Orokonui, Otago Museum The Halo Project and Predator-free Dunedin

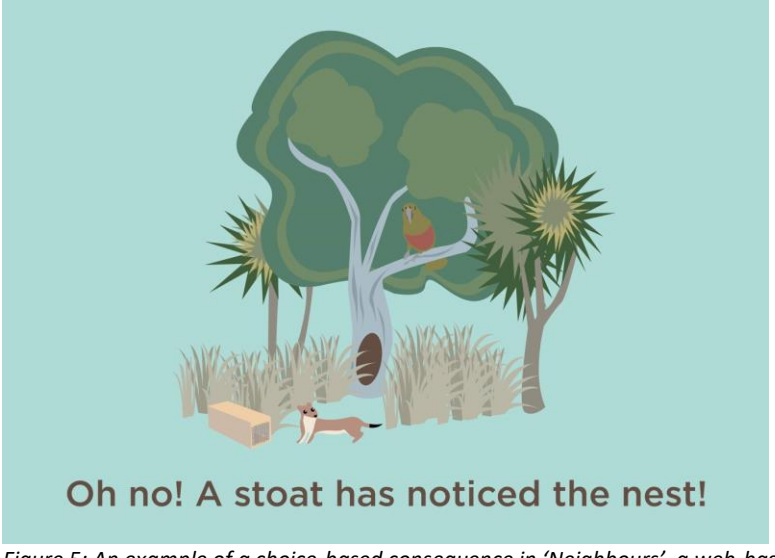

Figure 5: An example of a choice-based consequence in 'Neighbours', a web-based game designed to engage Orokonui's halo community to better understand how they can create backyards that are safer for kaka. Image provide by Katherine Woodfield and Georgia Ryan 2019.

From their design research the students reflected on the nature of their relationships and how to encourage others to respect and both actively protect and leave space for the birds' own needs. One of the main themes that emerged through this research was the importance of maintaining healthy boundaries between people and nature. "Not pets, not pests" was the term Woodfield and Ryan chose to describe this relationship, where the effects we can have on each other are explained in terms of healthy distance.

> "…in this world it can be easy to forget that we are a part of nature too and that we are holistically connected to the world around us. It can be easy to forget how to interact with our native plants and species, with introduced pests, or with a curious parrot that finds its way into your backyard. … we want to encourage people to think actively about the choices they make in their backyards… (and to) think about the experience a kākā has in this world, and how individual actions may affect them…

The students found that storytelling and gameplay could help people experience this healthy distance, but realise other forms of connection too.

> "By combining storytelling, technology and conservation, we hope that people will come to realise that the world of an ecosanctuary and the world of a backyard are not separated, but connected and dependent. " (*Woodfield and Ryan, The Kākā project dissertation 2019, p49*)

Through our regular visits to the sanctuary Design students were compelled to listen and learn carefully, walking and talking about the experience and their changing ideas, and working with the needs of others, including the kākā themselves. In the process of working in this way, we became part of a local community – forging close connections. We would often sit silently in the forest listening to the activity around us. Listening was an important way to learn, but students asked many questions, and became well versed in the behaviour of the kākā flock, who we rarely saw at the sanctuary during the day.

Dynamic systems in which we are always a part

As a group of colleagues[6] we have developed methods for working with environments and communities, drawing upon the Double Diamond approach, combining direct first hand experiences, experience and journey mapping, developing stakeholder relationships, conducting expert interviews and literature and context reviews before analysing, developing prototypes, and seeking feedback from participating stakeholders and users, iterating and prototyping.

However, as our work has led us beyond human users, I look outside of design writing to reflect and make connections that we can introduce to design thinking too. Donna Haraway,

[6] Denise Narciso and Ana Terry were co-teaching on the Town Belt Kaitiaki project, and Denise Narciso has worked as a co-teacher in a number of other projects since 2017. Other teachers assisted with project development including Martin Kean and Morgan Oliver.

is a feminist and biologist, who reconsiders the ways we think about our human place in the world. Haraway's (2010) book *When Species Meet*, inspired me to consider our design classroom experiences beyond their immediate educational outcomes. Haraway's challenge in the opening pages of the book, is to question our separate wholeness as beings, drawing upon "co-habitation, co-evolution and cross-species sociality" (Haraway 2003) in order to refocus on ourselves as always in dynamic co-operative systems equally biological and social.

Within these systems Haraway encourages curiosity, a quality we foster in design studios too. "Curiosity should nourish situated knowledges and their ramifying obligations." (Haraway 2010, 289). 'Situated knowledges' is a term Haraway uses, proposing that we value 'embodied' accounts of knowing and that we consider all we know as mediated through specific and historic contexts. "Situated knowledges require that the object of knowledge be pictured as an actor and agent, not as a screen or ground…"(Haraway 1988, 592). Haraway insists that we engage in the "power charged social relation of conversation" (Haraway 1988, 592). A conversation requires us to position ourselves, to speak as well as listen, to accept in order to respond. Conversations require humility and patience. These two projects both required many conversations with a variety of project partners and stakeholders. Beyond that, a special kind of listening emerged within both student groups, with implications beyond the human. Through our work with forests and their inhabitants and human caretakers, design students did not dwell in the past nor harked for a return to a previous untouched time in New Zealand's history. Rather they sought to understand our connections – with each other, and beyond human – and by implication our responsibilities.

Our conception of nature as separated from daily human experience has its roots in Eurocentric meta-narratives and dualist ontologies. A history of designers working with nature is identified by Louise St Pierre (2019) where a continuum of changes beginning in Europe in 1500's continue to shape the way that designers think and work, through the separation of human thought and earthly matter. While St Pierre traces a history of attempts by designers movements to reconnect this dualism, human-centred design continues to position humans as actors, and frames nature as powerless. This is in stark contrast to Haraway's 'objects of knowledge' that she insists are positioned as actors or agents. St Pierre advocates for humility, and specific and place-based practices, supporting Blenkisop's call to "…turn to nature as a teacher: "New relationships and commensurate language will arise slowly out of action–actual engagement in new ways of being present to, and interacting with, the world." (Jickling et al, 2018: 36, in St Pierre 2019, 105).

St Pierre is advocating action-based engagement of designers in the first instance, a practice also required in both projects described in this paper. We could not have gained the same level of engagement with our design environments and communities without direct engagement. Although direct engagement is a premise of human-centred design, social relations that extend beyond the human would be unusual. Our work with forest environments and birds sought to create and share a social approach through a design-led enquiry.

A third article also helped me to consider these projects. Juanita Sundberg is contemporary Canadian writer, her article 'Decolonizing Posthumanist Geographies (Sage, 2014) – although not written for design educators – provides both a critique of dualist conceptions of nature, but she also proposes ways or methods for working differently.

Sundberg identifies three steps for practicing in ways that decolonize posthumanist thinking about our natural environments, and in each step, I have found parallels in the teaching and learning projects described, or in the New Zealand education context that I am practicing within.

I summarise Sundberg's three steps and consider the how these may be identified in the two design projects.

Step 1: Sundberg's first step is locating the self, 'identifying the position you learn from'. Sundberg proposes that we recognize our position but that the goal is to move beyond it, using the term 'homework' to describe this. "…homework starts from where we are but the goal is to move beyond identity politics to take responsibility for the ontological and epistemological worlds we enact through the paths we walk and talk." (Sundberg 2015, 40). This echoes Haraway's situated knowledges. In a simple way, our students are making first steps towards recognizing and negotiating their position through leaving their classroom, and working with others. They start to propose that the work of designers is much more focused on relationship building, and seeing through anothers' eyes, and that other's eyes could be those of a parrot.

Step 2: Sundberg's second step is 'Learning to learn about multiplicity'. She builds from the concept of 'walking with' put forth by the Zapitistas in 2005, which proposes 'participatory reciprocity', framing knowledge as a social activity. In this Sundberg believes we must make room for indigenous knowledges, protocols and methodologies.

A number of Māori concepts were employed by both consultants and stakeholders throughout our projects. These concepts are not easily translated, and are inseparable from the experiences of working with other indigenous frameworks. The Kākā Project students, while not indigenous, identified the importance of respecting and making room for Māori concepts, and did not separate this from other forms of knowledge. They described the birds as *taonga* (treasures) alongside the fact that they are an indicator species – a biological term – embedding cultural value as inseparable from environmental and ecological value. The concept of *kaitiakitanga* (guardianship) held both projects together, connecting students with both their forest environments and their environmental caretakers, and both had consultant activities through formal partner relationships with local *runaka (*tribal) representatives.

Step 3: Sundberg's final step is recognizing walking as a performative co-production of knowledge and space …"Dialogic practices/politics of walking and talking, doing and reflecting…the path to social change must be walked and talked " (Sundberg 20015, 40).

During both projects, design students were required to leave the classroom and learn through direct experiences, and through working with others including regular forest trips. The powerful process of walking and talking cannot be underestimated, and shaped the nature of both project experiences, as we learned from each other, from and through the forest experience.

Sundberg's three steps connected with Haraway and St Pierre's efforts to define a relationship-based engagement with more-than-human and natural environments.

Design education

Designers and design educators have started to embrace and communicate open-ended and dynamic environmental processes as responsive systems; however through projects such as these we start to see the limitations of some of the design frameworks and processes. We need to continue to ask questions of human-centred design and its methods. This will require different interpretations of agency, environment and action for designers and design educators. We need to continually consider how we can broaden human-centered design processes to include the more-than-human in social relations and reflect this through teaching and applying skills such as humility, listening and making room for other sorts of knowledge, including the non-human. We need to be critical of design processes that don't recognize the necessity of being specific and located, and those that consider a single design process as universal.

These projects did not start out to seek to be critical of established methods but required listening, observing and finding opportunities. Alongside this, students engaged in developing environmental, cultural and social literacies, and interpersonal skills. In many ways collaboration is at the heart of these projects. Teachers work collaboratively with students who are working in design teams with others. Beyond the classroom however, students learn to work with stakeholders in a collaborative way, including the co-design of potential design solutions. These projects are founded in developing strong relationships, and out of these emerge trust. In these cases relationships extended beyond human relationships, to include specific forest places, at times both performative and relational. While to claim that we became "interwoven with our environment" (Stuhr-Rommerein and Day 2012) would be an overstatement, these design education experiences did become 'thinking tools' to help us communicate sites, experiences and opportunities with each other and with others.

Abstract | Design education faces new challenges due to the growing globalization, dynamism of markets, the development of technology and high levels of complexity in various systems. The Circular Economy has been proposed as a restoration concept that implies reusing materials, using renewable energies and reducing waste. Designers have the opportunity of leading sustainable innovation by considering the long-term implications of their actions. Design educators should focus on teaching future designers to think critically to fulfil the responsibility of designing a sustainable world. Nineteen instructors at our design school were certified by The Index Project® to teach the Compass® methodology. This paper describes major takeaways self-reported by the participating instructors through the final article assignment delivered to Index. Findings from each article were classified and compared using a matrix to determine common and individual discoveries. Data analysis enabled us to identify successful aspects of the methodology when applied to the variety of cases and areas of improvement for future development. The Compass proved to be a flexible frame of action to organize, structure and manage the design process. The fundamental aspect valued by instructors and students is the focus of the method on maintaining coherence between FORM, IMPACT and CONTEXT throughout the design projects.

KEYWORDS |DESIGN EDUCATION, DESIGN TO IMPROVE LIFE, DESIGN FOR SUSTAINABILITY, DESIGN CULTURE, RESILIENT DESIGN

1. Introduction

Currently, design education faces new challenges in response to the growing globalization, the dynamism of markets, the incessant development of technology and high levels of complexity in various systems. The traditional Linear Economy model of consumption ("take-make-dispose") is unviable due to constraints in the availability of resources, scarcity, and the damage of the environment (Stegall, 2006). The Circular Economy model has been proposed as a system that is "regenerative by intention and design" (Ellen MacArthur Foundation, 2015) shifting the disposal 'end of life' of products and systems, for a restoration concept that implies reusing materials, using renewable energies and reducing waste. Confronted with this rapidly changing reality and the world's actual complex challenges, such as the Covid 19 pandemic, designers have the opportunity of leading innovation by considering the long-term implications of their activities and thus, design educators must focus in teaching future designers to think critically to respond to the responsibility of designing a sustainable world (Andrews, 2015).

Design educators need to constantly strengthen their knowledge, skills, and abilities, by incorporating pedagogical and creative approaches that enhance their students' and their own learning and mindset building process. Instructors must empower students with the concept of design as a way of living, thinking, and thriving. Consequently, design students who develop a resilient mentality, can transform problems into innovative and sustainable solutions for social welfare, improving people's lives.

Our design school counts with a wide variety of instructors, trained in different and specific areas. As a design school in the 21st century, we aim to install a common and valuable design culture to transmit to our students the core mindsets and roles of designers as relevant actors in society. Considering the influence and responsibility that design has in the preservation of the environment and in transmitting ecological literacy (Orr, 1992) to the global population through design, we signed an agreement of collaboration with the Danish NPO: The Index Project®, which considered certifying nineteen of our instructors in the methodology "Design Compass to Improve Life®". In order to receive the certification, each participant (or team) had to design and implement an intervention in which they applied the methodology to solve a challenge detected in their work at the Design School.

Section 2 of this paper reviews the implications of the transition from a Linear to a Circular Economy, the role and opportunity for design and designers in this scenario, the need for educating designers for sustainability and some of the resources, methodologies and tools available for them. In addition, it describes the Compass methodology. Sections 3 to 6 are centered in displaying the variety of interventions designed by the instructors and major takeaways from their experiences applying The Compass methodology to solve diverse challenges.

2. Literature Review

2.1 Towards a Circular Economy, the role and opportunities for design and designers

Today, the world faces a major environmental crisis as a result of the development of The Linear Economic model which benefited some aspects of productive systems–oriented mainly to consumption–deeply damaging the environment and the natural resources reserves (Andrews, 2015). In this scenario, the Circular Economy model has been proposed and is beginning to be successfully implemented as a way to 'design out' waste (Ellen MacArthur Foundation, 2015) by rethinking productive systems to favor disassembly, reuse, and produce cleaner energy. But the environmental and sanitary problems we face today are not only influenced by the physical attributes of products. There is a need to transform the values by which we live in the world, which represents an "extremely complex sociological dilemma" (Stegall, 2006).

In this context, design as a discipline and designers as practitioners, have a relevant role (Kolko, 2015), and a responsibility as changemakers in a culture of resilience. If designers supported the development of the Linear Economy in the past, they have today the "potential of facilitating and even leading the development of a Circular Economy'' (Andrews, 2015). Stegall (2006) proposes the concept of "intentional design", based on designing products that support positive, and constructive ways of living in the world. If design is focused on the well-being of people and the planet, it can actually improve people's lives (LUTNÆS, 2019), and even likely be able to influence in the way people live and in the "values they hold" in the future (Stegall, 2006).

But how can we influence as design educators to provoke a change in mindset of future designers? Probably the first thing that we need our students to question is the responsibility of creating more products that respond to a culture based on consumption and premature obsolescence and motivate them to shift the paradigm to replace the concept of 'consumer', with the concept of 'user' (Andrews, 2015; Kolko, 2015; Stegall, 2006).

2.2 Design education for sustainability

Educating designers for sustainability is described in the literature as a fundamental aspect of design curricula (Andrews, 2015; Stegall, 2006; Orr, 1992). At the same time, the concept of 'circularity' is proposed as a powerful 'rethinking device' to produce creative solutions and stimulate innovation (Ellen MacArthur Foundation, 2015). Designers educated for sustainability, will be able to incorporate sustainable thinking in their projects (Andrews, 2015), and will understand local needs, cultures and ecosystems to produce adequate solutions to diverse challenges. Future designers will only design for sustainability if they

develop their own ecological literacy first. This way they will also spread ecological literacy to all members of society through intentional design (Stegall, 2006).

The design process used historically by designers has been described as a 'designerly' way of thinking that alternates iteratively the space of the problem and the space of the solution. Through these cycles, the problem is framed and re-framed and the ideas with which designers seek to solve them evolve and are modified (Dorst & Cross, 2001; Wiltschnig, Christensen, & Ball, 2013). Designers 'engage in a dance of process, creativity, and often conflict' (Kolko, 2011), making sense of challenges identifying constraints and requirements of their users.

There are diverse models and methodologies that have been developed to support designers in their evolution to a more sustainable design practice. The "Cradle-to-cradle" approach (Braungart, M., McDonough, 2002) proposes that products should be designed so that after their useful life, the materials they are made from become nutrients for new products or for living organisms. Eco-design (Brezet, H. Van Hemel, 1997), defines a series of strategies to manage and assess the ecological aspects of a design and its productive process based on the Eco-design wheel. The Circular Design Guide developed by the Ellen Mc Arthur foundation (EMF) and IDEO was created to support circular principles in organizations and has proven to be effective as a hands-on guide (Reigado, Fernandes, Saavedra, Ometto, & Da Costa, 2017).

All of these methods support the movement towards more sustainable modes of production, and the development of critical innovation. As described by LUTNÆS (2019), critical innovation "calls for everyone first to consider what situations to change, then the socio-ecological consequences of intended change, and who would benefit from a specific situation changing". Andrews (2015), complements the previous by pointing out the need for designers to approach problem-solving in a holistic way, orienting their thinking and practice of design towards the Circular Economy to create sustainable products and services.

The Compass® methodology developed by The Index Project® is a model proposed to structure the design process which can be combined and complemented with the methods mentioned above to create sustainable solutions to improve people's lives.

2.3 The Index Project®

The Index Project®, formerly INDEX: Design to Improve Life®–born in 2002 in Denmark–is a Danish NPO with global reach that inspires, educates and engages people in designing sustainable solutions to global and local challenges. The organization promotes the application of design and its processes to create better solutions in vital areas of the lives of people and communities worldwide. The development of their design approach is coherent with the literature revised on the belief that our globalized and knowledge-based world demands different skills from those needed in the industrial traditional linear economy. Societies need critical, innovative and responsible citizens who can ideate solutions for

complex challenges using cross-disciplinary, user-centered and sustainable processes, methods and techniques applicable by everyone (not only by designers).

Although they agree on the relevance of Design Thinking and the creative methodologies connected to it as a means to provide future generations with the skills needed in the 21st century, they insist that mere design thinking is not enough. They suggest that design methodologies must be deeply anchored in what the organization in 2002 coined Design to Improve Life; a user-based design approach that ensures that the triple bottom line of economic, social and environmental sustainability is always taken into account.

2.4 The Compass® methodology

The Compass® (The Index Project, 2012), is the backbone of the learning initiatives developed by The Index Project®. It is a problem-solving and planning tool that integrates the three fundamental competencies of didactics, process facilitation and 'design to improve life'. It guides the design process by helping students and/or professionals to navigate, focus and stay on track, while encouraging curiosity, engagement, creativity and innovative thinking.

It uses the parameters of **form, impact and context** in four phases: **prepare, perceive, prototype and produce**. In this way, fundamental aspects of the development of a design solution are covered such as function, potential, level of innovation, propagation and economic, environmental and social sustainability. In addition, it examines usability and cultural/geographical factors, specifically in the context where the solution will be implemented. Combined, these parameters assess the real possibilities of a design to improve people's lives.

FORM: evaluates the surface, material, interface, color, coherence and aesthetics of the design.

IMPACT: is centered in the relevance and real potential of the design to improve people's lives and in its economic and environmental sustainability.

CONTEXT: focuses in the context in which the design will be inserted, the relevance of the challenge and the solution in the culture and geographical location in which it will be implemented.

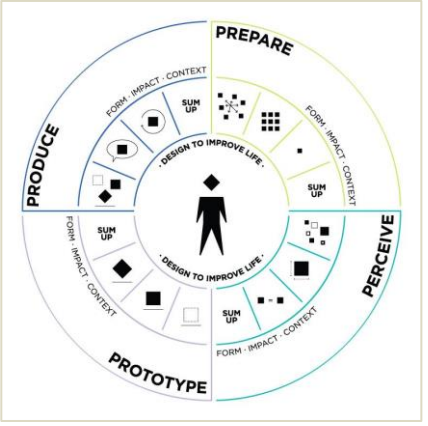

Figure 1. The Compass® methodology developed by The Index Project® Each of the four phases are composed by a series of steps that ensure the form-impact-context triad is being assessed.

3. Methodology

Nineteen instructors at the Design School participated in the training program to learn how to use the Compass. The selection included academics dictating a variety of courses in the three majors that the school offered at the moment (Graphic Design; Space and Object Design; and Digital Interaction Design). The training program consisted of sixty-five class hours hosted by two members of The Index Project®, divided in two weeks spaced by 5 months (March/August 2018). During the first week, participants were introduced to The Compass methodology going through its four phases and concluding with the delivery of a fast one-day team assignment. During the second week, the training focused on deepening the acquired knowledge and exercising various facilitation roles to enhance the learning process of instructors and students. The training was finalized with the planning of an implementation intervention using a whole Compass cycle by each instructor (or groups in case of co-teaching teams).

This paper describes preliminary results in the form of main takeaways self-reported by the participating instructors through the final article assignment delivered to Index and from the feedback given by The Index Project team. Findings from each article were classified and compared using a matrix to determine common and individual discoveries. Data analysis enabled us to identify recurrent successful aspects of the methodology when applied to the variety of cases and areas of improvement for the future development of the Compass.

4. Intervention cases

Table 1 displays a description of the intervention cases designed by the instructors individually and in teams depending on the selected challenge. The election of the challenges was free, limited only by the requirement of planning and executing a whole Compass process (going through the four phases). The majority of the instructors developed plans related to their courses, but some teams also designed workshops for organizations or collaborative projects between the Design Schools and companies or institutions. For example, one of the groups chose to use The Compass methodology to develop, plan and frame a strategic vision for the University, which for the Index team "*shows a great overview that you can actually use design-based tools in an academic context*". Another instructor used a real-life challenge: cycling in the Municipality of Concepción to empower students to use their knowledge and skills to improve their communities' lives.

Table 1. Intervention Cases designed by the instructors at UDD.

WORKING GROUPS	Area of intervention	Title of the intervention
CASE 1: 3 instructors	**Organizational/**Strategic Planning Design for Schools at UDD	Towards a strategic approach in universities: Design tools for strategic planning to envision the future.
CASE 2: 1 instructor	**Academic & Collaborative**/2nd Year Graphic Design Studio jointly with Ashoka Chile	COLLABORATIVE DESIGN / Temporary Exhibition Information System to disseminate the experiences of young Chileans who are agents of change.

5. Main Takeaways described by instructors and The Index Project team

- **Alternating divergent and convergent approaches:** The Compass methodology enables to flow in the dynamics and challenges that are present when alternating between divergent and convergent approaches. This is highly useful when facilitating a design process, as it provides a solid overview of the interdependency between the space of the problem and the space of the solution. Participants reached a high level of motivation and commitment participating in the activities which greatly favor creative and divergent thinking so necessary to design and plan with future vision. In addition, teams were able to converge and agree upon the large number of ideas generated by working collaboratively.

- **Focusing in action:** The dynamic experience of using The Compass and its various techniques keeps the process active and creative. The four phases are oriented towards action and critical thinking is experienced through hands-on activities that foster collaboration and decision-making. In addition, the use of the body and movement is supportive of a philosophy of teaching that in the words of an Index facilitator: “isn’t solely about the mind but, just as much about the body”.
- **Supporting teaching and project structure:** The Compass methodology supports both teaching and learning. It considers how to foster creative thinking in students and at the same time pushes instructors to plan their activities in a detailed way, considering their learning objectives and expected outcomes. The structure given by the four phases of The Compass combined with setting clear learning goals for each of them gives students a clear understanding of what to achieve in each step of the process. Students demonstrated that they understood the fundamental aspects to consider in their design processes after experiencing the use of The Compass.
- **Exploring Mindset, Motivation and Fun:** The Compass techniques are very strong in the early phases of the design process forcing participants to develop an exploring mindset and not jump into defining solutions before the challenge is thoroughly understood. This approach pushes students towards change and out of their comfort zone. The energizer techniques provided in the Teacher’s Guide proved to be useful for students to gain energy when the design processes become exhausting and extra challenging, “shake-up and renew the work environment, hence boost the motivation” (Index team member).
- **Creating a learning community:** Students and instructors shared the confidence they felt by being part of a learning community while using The Compass. The techniques offered by the Compass, especially in the first two stages (Perceive and Prepare), enabled facilitators to create an appropriate environment for all participants to have an opportunity of being heard. In addition, students worked collaboratively which contributed enormously to the quality of their projects. The “four learning spaces” defined by the methodology (roles of facilitators during the process), opens up a completely different learning community and an inspiring constructive feedback culture in the classroom. Instructors described they felt more connected to their students’ topics of interest and personal visions and also more objectively critical about their proposals.
- **Assessing coherence for sustainability:** The FORM-IMPACT-CONTEXT triad and the instruments available to analyze them, supported students to question and assess their ideas by collaboratively assessing the variables in the following way:

  FORM: What is the solution I am creating? Why does it have that form? Is it sustainable economically, socially and environmentally?
  IMPACT: Who is the user of my design solution? What does he/she really need?

CONTEXT: What is the context were my challenge is inserted? How does that context define the solution? Why is my solution adequate for that user and context?

6. Areas of improvement for future development of The Compass methodology

- **Data Analysis Tools:** Instructors observed that even when some students collected interesting and relevant data from their users, they did not know how to process, interpret and synthesize that information in order to generate insights for their projects. Complementing the Compass with specific tools to organize and approach the analysis of observation and interview data would support this gap.
- **Connecting objectives towards expected outcomes:** Instructors concluded that listing up objectives and expected results for every phase of the process enables them to plan clearly. Incorporating a technique to intentionally connect these aspects could contribute to the coherence of design projects and teaching-learning plans.
- **Deepening user study:** One of the main difficulties faced by the students was the identification and understanding of the user. The "personas" technique helped them to imagine and visualize a possible user, but they were not proactive in deepening on the users' lives and empathizing with them. This distance from reality influenced their ideation process decreasing the degree of innovation, adequacy of their solutions and coherence of their projects (which weakened the FORM, IMPACT and CONTEXT triad).

7. Conclusions

Through this initial overview of results of the fourteen intervention cases implemented by our instructors, we conclude that The Compass is a flexible frame of action to organize the design process. It is not a specific design tool to develop product design, or eco-design, but a structure that enables to manage the creative process and combine it with other instruments. Going through each phase enabled students to visualize the project as a whole and organize their actions towards a clear objective.

The fundamental aspect that we highlight is the focus in maintaining coherence between the triad of FORM, IMPACT, and CONTEXT. The constant recapitulation of these three dimensions during the four phases of the process enables to transform research data in

empiric evidence that materializes through innovative, sustainable and adequate solutions that improve people´s lives.

As partners of The Index Project®, we peruse to analyze all of the implementation cases in more detail, compare them and work towards evolving The Compass and its future impact in design education and project development.

Design for Social Impact and Crafts Communities in Turkey

Hazal Gumus Ciftci[a*], Stuart Walker[b]

*gumusciftci.1@osu.edu

Abstract | A considerable amount of social impact projects promise the revitalization of the crafts sector and empowering of the artisans. While a part of ongoing projects around the world might be considered successful, the rest loses the essence of working with the craftspeople and is rather another design project for consumerism.
Therefore, this research examines various cases from around the world that tackle the issues surrounding poverty by working with craft communities. This online survey of social development projects, semi-structured interviews with artisans and one of the author's own observations in craft workshops in Turkey reveal the opportunities, problems, and areas of consideration for design practice. These findings are expected to pave the path for designers in creating a more conscious effort in working with socially, economically and culturally diverse communities and enhance the relationship between the craftspeople and designers.

KEYWORDS | DESIGN FOR SOCIAL IMPACT, CRAFTS, DESIGN INTERVENTIONS, EMPOWERMENT

1. Introduction

Design is usually associated with mass-production and high-end markets and some scholars criticize designers for not devoting their time to the world's real problems (Papanek, 1971; Fuad-Luke, 2007). However, there are many examples of design interventions that have positively affected the lives of less fortunate people (Pilloton, 2009). Margolin states that design for social impact, or design for development in his words, has existed since the 1960s and "since the 1960s, it has been introduced sporadically to the development process, although it is yet to earn itself a permanent place in that process" (2007). However, designing for developing contexts usually happens from afar and designers tend to invest their free time or pro bono activities around this concept (Fuad-Luke, 2007; Donaldson, 2008). Papanek asks, "Isn't it too bad that so little design, so few products are really relevant to the needs of mankind?" thereby criticizing designers with no interest in developing countries or rural problems (1971, p.62). The contemporary design world favors consumption-oriented design over socially responsible design (Pilloton, 2009, p.10). Pilloton suggests that "beyond the individual egos of those in the profession, however, the design firm is a mechanism that traditionally caters to corporate clients and their target consumer markets" (ibid., p.14).

While writing about the design for 90% of the exhibition of Cooper- Hewitt National Design Museum, Chick and Micklethwaite claim that developers might have good intentions toward local output in the developing world; however, the projects are usually designed by Western designers (2011, p.155). Admittedly, the criticism here is not for the designers' good intentions; however, there are a plethora of diverse layers in development projects that need to be taken into account. Briefly, societal norms, legal framework, budget, governance, financial access, cultural beliefs, continuity of use, and availability of materials can be named as consideration points (Rogers, 2014).

Manzini says that design is at the core of the problem of the world's situation today (2007, p.77). Though it can also become the answer to contemporary issues since "it [design] is the social actor that above all others, by its very nature, has to do with the everyday relationships of human beings with their artefacts" (ibid.). As Pilloton explains:

> "By adding design to the social entrepreneurship equation, we form a symbiotic relationship between people, product, and profit, bringing design to more socially and fiscally sustainable arenas while giving enterprises a tangible and deliverable tool around which to structure production, job creation, and economics." (2009, p.17)

In his book The Green Imperative, Papanek lists seven specifications for a designer, and the last two especially are more striking for the sustainability-conscious designer. These

specifications are “the wisdom to anticipate the environmental, ecological, economic and political consequences of design intervention” and “the ability to work with people from many different cultures and different disciplines” (1995, p.8).

2. Social Impact, Design, and Crafts

Crafts are “any profession that requires the use of the hands and is limited to a certain number of mechanical operations to produce the same piece of work, made over and over again” (Hirszowicz cited in McCullough, 1996, p. 12). Against all odds, crafts continue generating jobs in developing and developed countries “at a minimal cost” (Richard, 2007). However, crafts are facing numerous challenges today. The UNESCO report points out that one of the obstacles in passing cultural values on to subsequent generations is the restriction in sharing the age-old knowledge with outsiders (2003). Though craft skills and techniques were passed down the generations, it is also known that some of the traditional crafts are declining since there are only a few practitioners left and no one will learn their invaluable skills (The Heritage Crafts Association, n.d.).

Risatti claims that in the contemporary world, after the Industrial Revolution, crafts have been diminished by design; by machine production (2007, p.153). However, Shiner says that craft and design are “historical partners” (2012). Kaya and von Busch (2018) argue that empowerment by design is a way of colonizing the craft practices since craft enterprises aren’t strong competitors versus mass-production. They suggest that two options for crafts are either abandoning them or turning them into products for tourists (ibid.). To comprehend the situation better this research looked at examples from around the world for which designers and craftspeople worked together.

2.1 Cases from Around the World

The first example is a non-profit organization called Potters for Peace that “offers support, solidarity and friendship to developing-world potters” and produce low-cost ceramic water filters (Potters for Peace, 2006). The design work is based on the engineering of a clay water filter, and the organization trains local potters in building these ceramic filters with specific materials so they can create hygienic water filters (ibid.).

Another notable example comes from the Philippines where Ann Wizer started a recycling project in 2006, working with trash collectors and women who turn this trash into handcrafted accessories. This project involved over 180 women and their guild began strengthening from its very inception (Invisible Sisters, 2009). This project shows the benefits of participatory design methods as a way of understanding people and their needs. It is also notable that Mahatma Gandhi suggested “the poor of the world cannot be helped by mass production, only by production by the masses” (cited by Schumacher, 1973, p.163). Potentially, manufacturing in groups, such as the Invisible Sisters do, can be an alternative

approach to tackling the social and environmental problems associated with mass-production and mass-consumption.

In another example, Kara Pecknold focused her dissertation work enabling craftspeople in Rwanda. As part of this project, she had to develop a technique for mutual communication; because none of the parties knew the other's language during the workshops she conducted (Pecknold, 2008). The result was a brand (Covaga) and identity development for the exported craft products (ibid.).

Similar to the projects above some companies organize social responsibility projects in order to give back to the community. These firms work with NGOs or form their own teams to work with local communities. The Italian company Moroso has developed a furniture series called M'Afrique by bringing together famous designers like Tord Boontje, Patricia Urquiola, Birselplusseck, Dominique Petot with craftspeople from Africa over a period of two years in 2009 (Moroso, 2011). The project claims to be empowering the craftspeople (Moroso, 2011), however, the longer-term sustainability of this kind of endeavor is questionable when the outcomes are so extravagantly styled and fashion led. Although the products can still be found on the company's website, Moroso's positive impact on the craft communities remains doubtful (Reetzke, 2012). However, the designers like Birselplusseck and Stephen Burks- who curated the first M'Afrique installation- still work with the artisans in Senegal (Birselplusseck, n.d.; Stephen Burks Man Made, n.d.).

Max &Co. worked with the local women in Nairobi, Kenya to develop limited edition bags (Colosimo, 2009). Because this company is in the fashion industry, the timeframe for the accessories produced by the Kenyan women was a maximum of two months.

Although the cases mentioned above had some positive impacts, one can also criticise the misuse of these uniquely grown, precious talents for the sake of, for instance, producing a piece of high-fashion furniture that is likely to last in the market only for a couple of months and then production comes to an end.

In contrast, working with Hella Jongerius, the Dutch designer, IKEA created a workshop in India, in which, once the production of IKEA pieces had finished, the women were allowed to continue working and being productive (IKEA, 2009). The continuity and long-term impact are key factors in development projects.

On another positive note, governments also started revitalization projects for traditional crafts. In Asian countries, a project called One village one product (OVOP) was launched starting in Japan to inspire artisans for manufacturing unique products (Rana cited in Tung, 2012). An example of culturally significant retrieval of lost crafts comes from the Middle East. In 2010, the government of Oman set up a training project to revive the silversmith craft and the production of traditional Omani Khanjar daggers, which have been worn by the men of the region for generations. Over recent decades, traditional Khanjar making had migrated to Pakistan and India and with it the traditional metalworking and fabrication skills (BBC, 2010). The training courses set up by the Omani government turned out to be

especially attractive to women- whereas traditionally, Khanjar making had been carried out by men. Moreover, with the skills learned for Khanjar making, came new possibilities for female accessories, as additional product lines. Many of the women are planning to open up their own businesses once they have completed the training program (ibid.). The government also set up standards for Khanjar production to allow only the licensed workshops to produce the traditional daggers (Al Mukrashi, 2016). Considering the words of Merriam, craft-related businesses empower women and decrease the need to migrate to bigger cities (cited in Chick and Micklethwaite, 2011, p.150). Apart from the technical and practical aspects of this project, the attempt to preserve the heritage and bring lost values back to the culture is a less tangible but culturally important aspect of this initiative.

A recent initiative, Atlas Harran, is "developed with a democratic approach bringing a diverse group of professionals together to open discussions and set the project framework collectively. This is why a commission was put together including academics and other professionals from design, archaeology and creative entrepreneurship" (Atlas Harran, 2018) with support from the local government in Southeastern Turkey. Working with local women and refugees, houseware objects are designed based on local capabilities and resources. Trainees gained new skills and the craft workshops continue employing them.

As Chick and Mickletwaithe (2011) say, crafts are basically about the culture in which they are cultivated. Therefore, it is inevitable to question the involvement of a third party – here the designer. Chick and Mickletwaithe also mention that the projects are usually delivered from the Western world to the less developed contexts - too abruptly, without considering the impacts (2011, p.154). Melles et al. (2011) also criticize social design solutions for being "band-aid or parachute products" in developing countries. The same authors suggest for social design projects the criteria to consider are "need in context, suitability to culture, affordability in community, skills creation for locals, local maintenance, usability and flexibility, empowerment and freedom from the top-down solution" (ibid.). There might not be a simple answer to all these concerns, and it is not easy to evaluate the projects/design propositions reviewed above. However, it can be said that continuity and acceptability by local people are the most important criteria for developing design interventions in craft sector since it is a vulnerable area (Starr, 2010).

3. Crafts and Design in Turkey

The fieldwork in Turkey interviewing craftspeople (felt makers, Oltu-stone prayer beads makers, coppersmith, and traditional Harik shoemaker), designers who worked with craftspeople, and people from craft-related organizations (e.g., development agency officers, chamber of commerce workers, vocational training center educators, culture and tourism center officials, and non-governmental organization volunteers), and craft retailers revealed issues concerning the crafts enterprises, possible ways to rejuvenate the craft

sector, and the situations to be aware of while intervening with the crafts communities. Initially, this study's aims were:

1. identifying the current skills, capacity, knowledge, resources and limitations of the traditional crafts sector,
2. developing a data inventory of existing craft-related enterprises, products, processes, markets, schools,
3. interviewing various actors (e.g. craftspeople, retailers, local authorities) to comprehend the local context and issues,
4. informing the development of a feasible approach for design to contribute constructively to the crafts sector and to help determine if such a contribution was required or helpful.

During the semi-structured interviews, informants were asked about the difficulties in the sector and possible ways to overcome these challenges. Respondents were also asked how the crafts could be made more visible and what they envisioned for the future of crafts. Their answers indicated a need for change to keep crafts alive.

3.1 Reasons for the Decline in Crafts' Production

Since the foundation of Republic of Turkey in 1923, there has been a dramatic decrease in the number of craft practitioners (Öztürk, 1998). A coppersmith from the Eastern Anatolia region explained that practitioners have declined from perhaps a thousand people to about ten in the last thirty-two years, during which time he has been practicing. The field study shows there are a number of different reasons behind this decline.

Materials Supply: Adequate and timely local materials supply was found to be problematic by craftspeople. In some cases, materials are imported, and people ignore the local alternatives. In other situations, the import of raw materials affects the perceived authenticity of products. Alternative material sources are considered particularly by designers working with the craftspeople. For instance, a designer shared her experience in using up-cycled and recycled materials to produce handmade bags.

Economic Concerns: While the disappearance of crafts is not due solely to economic concerns, craftspeople do complain about not being paid well. Even master craftspeople talked about quitting their jobs because of the economic struggle. Economic problems are also related to increased competition – handmade products have to compete against less expensive goods from abroad and with mass-produced goods, which are more affordable.

Training: This age-old knowledge is usually transferred from father to son or mother to daughter, and the work is kept alive. Unfortunately, due to the current situation of the sector, a decline in the prestige of craft jobs, and fast changing consumer trends there has been a decrease in interest among young people.

Personal Satisfaction: Craftspeople who were interviewed are clearly committed, heart and soul, to their work. Even though their hard work does not often pay very well, craftspeople

feel lucky to have chosen their jobs. On the other hand, craftspeople are concerned about their working conditions. One of the junior craftspeople who is fashioning Oltu-stone prayer beads describes their work as painful since they have to sit down all day for long hours while dealing with some chemical substances used for fashioning the prayer beads with silver.

3.2 Potential Areas for Design Interventions

Respondents (craftspeople, designers and local authorities) suggested that the sector needs to undergo change to be more visible and to be kept alive. Their views are categorized as updating the crafts to fit in different markets, innovating the production processes and material use, developing regulations especially on government level and creating a viable way for passing the tacit knowledge to the next generation.

Updating: The importance of being up-to-date was mentioned and suggestions from informants vary from working with a designer, employing new production techniques, creating contemporary products, and finding an alternative function for traditional goods and ways of making.

Updating these age-old traditional products might be either utilitarian or aesthetic, to open up new markets. Development of production processes, materials, utilities, or appearances is expected to keep them alive. An expert of culture said during an interview, the update of these obsolete craft objects is required while retaining their traditional values.

Respondents suggest that keeping traditional crafts and products alive requires adaptation to contemporary lifestyles. Creating up-to-date products or producing goods for diverse and expanded markets might be a way forward for forgotten traditional products, according to informants.

Innovation: Traditional crafts are becoming lost one by one in Turkey. Innovation is one of the ways that respondents felt could be a way of making traditional crafts visible. Production of another type of wooden clog, the Takunya, is one of the crafts, which are on the brink of extinction. A designer who works to revive this craft explains that the craft did not change at all over the years. The skills were passed from father to son and they always crafted the same product.

Alteration of the production processes or the traditional products was achieved when felt producers worked with designers in Western Turkey; however, the younger generation still has difficulty in convincing the senior masters for different ways of making. The felt maker explains that he would not be able to create the new product line consisting of felt and silk shawls if he did not own the workshop.

Interviews show that an innovative approach is required for the rejuvenation of traditional crafts. Using different materials, exporting to new markets, employing contemporary production techniques, and creating new products by using old production techniques were considered as innovative approaches by the respondents.

Policymaking: Oltu-stone prayer beads in Erzurum face credibility problems since there is an imported stone from Georgia which is similar to Oltu-stone. There are mass produced prayer beads from the Georgian stone sold all around Erzurum. An Oltu-stone master explains that the mass-produced Georgian stone beads cost almost a fifth of the original Oltu-stone prayer beads which makes it difficult to market especially since they both look the same to the customers. There is a chamber of merchants and craftspeople in every city, including the field studies area, but only the felt maker who lives in Western Turkey mentioned being a member. Craftspeople admit that there is a lack of networking amongst each other nowadays.

Competition, lack of networking between craftspeople, and non-standardization of quality will continue to erode an already diminished sector. Developing strategies together with the local development agencies will enable craftspeople to create trust between the customer and their products.

Knowledge Sharing: Crafts are learned through apprenticeship. The time required to become a master may vary for each type of craft; however, the master-trainee relationship remains constant. Over time, traditional crafts have lost their status. Hence, the masters could not find apprentices in most cases. All craftspeople who were interviewed agreed on the disinterest of young people in learning this age-old knowledge. Attempts to pass on inheritance by training young people seem ineffective. A master explains that the training courses for crafts were a scam and a dedicated traditional shoemaker explains that the Ministry of Culture organized courses where he had the chance to train almost a hundred apprentices. Unfortunately, none of the trainees continued working due to work and market conditions.

Even though craftspeople have economic difficulties, there is an undeniable turnover from the crafts sector economically. A designer acknowledges that her work with craftspeople gets attention for the economic outcome. An interviewee said that related academic departments have a significant role in preserving traditional crafts by transferring knowledge and transitioning skills when required.

There is a network growing among the interested organizations and individuals that support the sharing of the age-old knowledge of craft making globally. However, there is a lack of robust mechanisms to ensure the sustainability of such initiatives. Interviewed craftspeople were not aware of such organizations. Education is another way of transferring skills and sharing knowledge. There are attempts to train young people provided by local authorities from time to time. Interviewees who participate in such activities agree on these courses' ineffectiveness. A shoemaker initiated his organisation to keep the traditional Harik shoemaking alive, but he resents the fact that there was no support from the local government.

3.3 Prerequisites for Design Interventions in Crafts Sector

The literature review revealed that some design interventions create sustainable solutions in developing contexts, whereas top-down solutions were not embraced by local people. Considering the issues related to top-down interventions, this study asked how the craft sector could be developed and made more visible in Eastern Turkey. The interviews then indicated requirements for interventions for traditional crafts' rejuvenation.

Determining the Risk of Cultural Deterioration: Interviewees conveyed their concerns about cultural deterioration and exploitation. An interviewee told about his observations when he visited a local market in Eastern Turkey that the silversmithing disappeared and then twenty years after there were only bad replicas being sold.

Interventions, especially in different cultures, require being attentive to local conditions and local views, not dictating what the trends are or changes should be or make decisions on behalf of the craftspeople. A designer/researcher who works for a social project with women acknowledged the significance of knowing where design could intervene. The craftspeople are masters of their own trade, but it becomes easily exploitable when an academic person intervenes with their work.

There are different social norms and barriers in various contexts, and the realization of such issues is required to ensure the viability of interventions. Another designer observed a change in families whereas, in the beginning, the spouses were against the participation of women in the training courses. In time, they started inviting the designer over for dinner.

Intervening with traditional crafts to rejuvenate and enable development for continuance may not be positive in every situation. As a result, considering the cultural background of traditional crafts before intervening was suggested by the informants to prevent loss in meaning and cultural deterioration. Furthermore, top-down approaches were regarded as a potential cause for exploitation of traditional values. Consequently, understanding social norms in context is likely to result in solutions that are more robust.

The Necessity for Passing on Inheritance: The socio-economic difference is dramatic between the Western and Eastern parts of Turkey. This gap and the commercial opportunities for menial tasks in the west contributed to locals in the east leaving their homes and migrating to Western Turkey. Projects for restoring the age-old crafts are in progress in various parts of the country. One of the designers said, "I will try to revive this type of weaving (Çarpana Weaving) which is about to be forgotten". Another interviewee who conducted a crafts-based project in the region suggested there was a decline in migration after feeling economically secure.

Traditional crafts are learned through apprenticeship and most of the crafts run in the family. Since the income generated from the traditional crafts is in dramatic decline, the majority of interviewed craftspeople do not pass their craft inheritance on in the family, or they cannot find an apprentice, and this causes the extinction of traditional crafts.

Enhancing the Interaction between Craftsperson and Designer: Informants who were included in an intervention project for traditional crafts' rejuvenation were asked about their experiences. A designer said some of the master craftspeople were not willing to share their skills and the designer stopped working with them after seeing degenerated replications of his designs.

An officer at a regional development agency claims that craftspeople were not interested in joining strategic conversations and development projects. Field research shows that there are challenges when designers work with craftspeople. Moreover, findings suggest ways of collaboration between designers and craftspeople such as consulting about the materials, techniques; leading the production by making the first design and letting them produce accordingly, and/or observing these non-designer makers and learning from them.

Although practitioners, designers, and local authorities can have difficulties in cooperating, there are ways of enhancing their interaction. Indeed, design interventions for craft practices might be a relatively minor contribution, and the designer has to consider whether there is a productive contribution to be made or not. Therefore, the designer must take into account why, how, when, and where to intervene with artisans' work.

4. Conclusions

The capability of design is underestimated in many cases evaluated for this study, and this usually results in disappointing short-term propositions rather than self-sufficient, long-lasting initiatives. Clearly, not all social development projects will be outstanding, but design can be a powerful tool when it is employed appropriately and inclusively. In that sense, design for the craft sector offers a variety of opportunities that can usefully and productively develop. While such an approach may help, there are a host of intangible contributions associated with conventional ways of making that lie beyond the reach of measurement, effective analysis, and quantification. These relate more to tradition, culture, values, world views, locally appropriate and traditional skills, tacit knowledge, and local experience uniquely attuned to the culture and geography of the place, community and deeper, often ineffable, notions of human meaning and fulfillment. These more profound aspects also have to be acknowledged if the priorities, understanding, and values that are currently eroding crafts and, more generally, the planet itself and its unique cultures are to be challenged and overcome.

The field study affirms that there's a decline in craft production due to material supply, economic and personal concerns, and lack of interest from the younger generation. Furthermore, potential opportunities for traditional crafts in Eastern Turkey were also investigated in this paper. Updating, innovation, policymaking, and knowledge sharing are among the ways identified by interviewees to boost and rejuvenate craftspeople's work conditions, quality of products, product's market value, and creativity.

Understanding social norms is a key factor when intervening with crafts because the craftspeople, their families, and the products they produce might be appropriate only for the culture in which they originate. The interaction between craftsperson and designer is a delicate issue since they usually come from a very different background. Unfortunately, past interventions have tended to cause a risk of cultural deterioration because they lacked sensitivity to and protection of the meaning, aesthetics, and/or functionality of traditional goods.

Abstract | In this paper we propagate the use of "design thinking" as a highly useful human centered approach for solving complex challenges, like developing smart sustainable cities, which require applying knowledge from different fields for fulfilling the synchronized needs of the people, business and environment. Students in a one semester programme on Smart Sustainable Cities were trained to use the design thinking approach in a specific case (Hilversum municipality as a garden city of the 21st century). This study reveals that there is great appreciating among students for using design thinking techniques, especially with regards to finding the real human needs, identifying opportunities and concepting / prototyping / testing ideas. It is however not self-evident that students will apply design thinking skills for their project work, despite the fact that design thinking skills are part of their 'tool box' offered during the program. Therefor the design thinking approach needs to be used as the guiding framework for such complex project subject.

KEYWORDS | DESIGN THINKING, SENSE-MAKING, CHANGE MAKING, LEARNING APPROACH, SMART SUSTAINABILITY

1. Introduction

1.1 Context

Since the beginning of the 21st Century the majority of the world population lives in an urban area. This imposes huge challenges for the cities of the future. How do we solve problems related to energy, mobility, and waste in the city? How do we ensure that new innovative businesses will provide sufficient employment in the city? And how do we ensure inclusiveness, participation, and tolerance in the city? These questions challenge us to develop integrated sustainable solutions for economic, social, and environmental problems. In this paper we propagate the use of "design thinking" as a highly useful human centered approach for solving complex challenges, like developing smart sustainable cities, which require applying knowledge from different fields for fulfilling the synchronized needs of the people, business and nature. While using the design thinking approach in real world cases, students learn to apply it in any developing work. Also learning the other key subjects becomes easier and more motivating, when by design thinking approach the students find the real needs to focus on.

1.2 Purpose of this paper

This paper studies the design thinking perspective applied in an educational program on smart sustainable cities. It elaborates on the following topics: how the design thinking approach was introduced to the students, how students felt about it, what kind of results were achieved in the projects and how beneficial the design thinking approach was for the results.

1.3 Approach / method

The delivery of the design thinking approach in the minor program Smart Sustainable Cities was studied from three different angles. First, it was evaluated from the learners' perspective by carrying out surveys among the participants in the course. Secondly, the delivered designs were reviewed to assess the impacts of the design thinking approach. Third, personal insights of the staff involved in teaching the design thinking approach were added to analysis as well.

1.4 Outline of the paper

The paper continues with a description of the design thinking approach used in the minor program on Smart Sustainable Cities (SSC) (Section 2). Section 3 will present the results of using the design thinking approach, the student experiences, and teachers' insights. In section 4, we will draw the conclusions.

2. A4DT - Approach Four Design Thinking and Minor Smart Sustainable Cities

2.1 A4DT – Approach Four Design Thinking

Design thinking has been a growing phenomenon for about a decade now, but still it is many times only superficially understood and labeled as “a buzzword” with no deeper meaning or professional credibility (Huang, 2017). For designers and the design world it is something that has been done always as part of their regular design work. For the need of a simple definition of design thinking, differentiated from the design as a profession, A4DT - Approach Four Design Thinking - definition was developed in the Turku University of Applied Sciences’ (TUAS) Design Thinking Research Group, see Figure 1 (Karhu, 2020). A4DT combines four core elements of design to an articulated and easily understood model that can be applied as an approach for any kind of human challenges. These four core elements are human experience, holistic views, experimenting, and concept design:

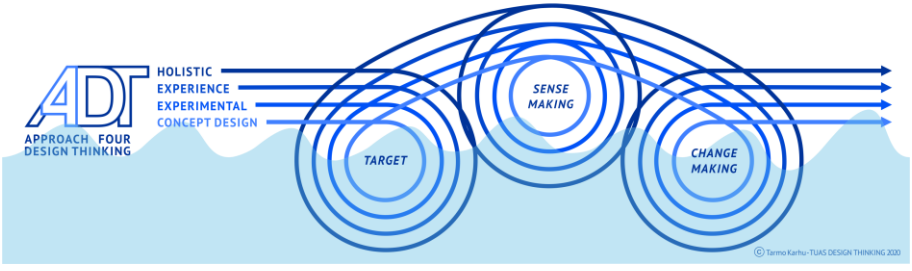

Figure 1: A4DT - Approach Four Design Thinking (Tarmo Karhu, 2020)

A4DT - Human experience (empathy): Understanding people's experiences and emotions is a key factor in finding the real needs and developing the appropriate systems and services for them. According to the Design for All principles, products and services should be accessible, understandable, and pleasant for everyone. In practice, this can mean, for example: various product versions, customizability and personalization, multi-channel communication, and semantic compatibility between the content and the expression. In action, it means designing for the users with the users in generative ways (Sanders & Stappers, 2014).

A4DT - Holistic view (context): Seek out the contexts of the target matter, the different existing connections between people, things, and systems. In the same process, possibly incomplete connections and development needs may also be seen. A holistic view utilizes the variation of distance and precision (remotely and close) and the perspectives and experiences of different stakeholders.

A4DT - Experimenting (empathy & context): Prototyping is a way to develop things: by experimenting with the idea, in practice, functionality, potential shortcomings and essential aspects of different user perspectives can be quickly detected and further developed into the next experiment and so on constantly refined. Rapid prototyping is also an excellent mean of communicating when a common understanding of a subject is created. In addition to user-centeredness, speed and risk-aversion are key factors in the development, compared to the development, where plans are only tested late in the process (slowness and cost).

A4DT - Concept design: It is worthwhile to concretize the promising opportunities into different alternative concepts, for opening the possibilities commonly understandable. In practice, the possibilities are different definitions associated with, for example, the changing world (megatrends, trends), the following alternative developments and the possible changes in people's needs and activities. The concepts are examples of what these developments and changes may mean in practice or how the following challenges can be resolved, and opportunities exploited.

In A4DT, perspectives and ways of doing combine with parallel and alternating levels, where, as the understanding grows constantly, the designs are constantly refined. Here, design thinking is defined more as something that happens in the early phase of developing, the phase of sense making. The possible change making that follows, will be executed by applying the needed methods of design, engineering, etc.

Design Plugin is a TUAS way of educating different organizations and experts, not just engineers, for the design approach. Based on 4DT Approach, it opens the Human and Holistic viewpoints and gives methods and tools for Experimenting and Concept design in all kind of development and innovation work. The concept of Design Plugin is an analogy to merging the core elements of design thinking inside the systems instead of just adding separated design elements and methods from outside and using them superficially and mechanically. Design Plugin aims at expanding the mindset of non-designers towards greater sensitivity on human and holistic perspectives and connections. Expansion of mindset is possible through both, personal and collective experiences and insights in working on real world challenges from the companies and organizations: experimenting with the different human perspectives and the fresh perception of the surrounding world leads to finding the real needs and opportunities, the possibly surprising new connections between them (Nielsen & Thurber, 2016), and ultimately to alternative solutions.

2.2 Minor Smart Sustainable Cities

The Smart Sustainable Cities (SSC) minor is a one semester program at the University of Applied Science in Utrecht[1]. It offers a multidisciplinary approach to the complex question of

[1] See https://www.internationalhu.com/exchange-programmes/smart-sustainable-cities for more information on the programme.

how to create sustainable and healthy urban living environments. In the program, students from different academic backgrounds and different countries collaborate on real-life projects commissioned by stakeholders in the Netherlands, other EU countries and even from South-East Asia. The minor program consists of 2 courses, 15 ECTS each, i.e. 'Smart Sustainable Cities – introduction' and 'The Sustainability Challenge':

Smart Sustainable Cities. In the cursory part of the minor (15EC) participants will learn about the ins and outs of Smart Sustainable Cities, they will learn more about energy, mobility and circular economy in various workshops, and finally they will learn how to apply relevant methods and techniques for researching, designing and advising on / about Smart Sustainable Cities. The latter includes for example the building blocks for social design, business model canvas, entrepreneurial skills, co-design techniques, research skills. Excursions to best practices are also part of the program.

Sustainability Challenge. During the Sustainability Challenge (15EC), participants will work independently in a team on behalf of a real commissioner (for example the municipality). Students will explore the sustainability challenge that the commissioner is facing, they will design smart, creative and innovative solutions for this challenge and advising how this can be converted into a viable commercial proposition. These assignments all have a multidisciplinary character; every student can therefore contribute to the solution from his or her own discipline.

The Minor has been developed within the ERASMUS+ project ESSENCE (European Sustainable Solutions for Existing and New City Environments) by five Higher Education Institutes: TUAS (Turku, Finland), UPV (Valencia, Spain), MMU (Manchester, United Kingdom), HAW (Hamburg, Germany) and HU (Utrecht, Netherlands). The project features extensive collaboration with local municipalities and companies, providing real-life projects for students. The teaching in the Minor is shared between the experts from sustainability, engineering, business, and design, to allow for a truly multidisciplinary approach to solving sustainability challenges; obviously design thinking being a key approach to start with.

2.3 Co-design and design thinking week of the SSC course

During the second course week design thinking approach was introduced for the students using the TUAS model, Approach Four Design Thinking (A4DT), that include the key aspects of design thinking in a simple form. Students also had some other tasks with their studies, but basically the week was reserved for the design thinking and co-design themes. Monday started with a short introduction lecture of the A4DT and design thinking in general. Since the students were already informed about the course project work during the first week, the project theme (see section 0) was used as a case in the design thinking week too. Students were grouped into five teams of 5-6 students, by considering the students' different skills and personalities in forming the most balanced groups possible. So-called DiSC profile questionnaires were used to self-assess students' behavior, thereby distinguishing between four aspects: dominance, influence, steadiness, and conscientiousness.

MONDAY – A4DT: HOLISTIC & HUMAN VIEWS

After the general design thinking introduction, student teams started to work on various tasks: first with the Holistic viewpoint (Sensing the Whole and the Details), continuing then with the Human experience (Empathizing). The aim was to increase understanding of the different levels with the different weights in the complex challenge (megatrends, trends, signals etc.), and the different human views (user personas) – the empathy for the people in the constantly and by multiple reasons changing surrounding world, the living environment.

TUESDAY – A4DT: HOLISTIC & HUMAN VIEWS – SENSING THE ENVIRONMENT & PEOPLE

For the first fieldwork day students got the assignment (Sensing the Environment & People) to go out for observing signals (Jalonen, Lehti, Tonteri, Koskelo, Nousiainen, & Jäppinen, 2017) in the real environment of the project case with open and fresh senses, and to talk with and listen to the people there.

WEDNESDAY – A4DT: EXPERIMENTAL CONCEPT DESIGN

Creativity grows, if the soil is fertile and well turned: the experimental concept design phase builds on the holistic and human views' findings. So, the deeper students have jumped into the target world and peoples' lives, the more there is material to build on and develop from. For that reason, the third day started with the students unwrapping and sharing their field experiences from Tuesday.

THURSDAY – A4DT: EXPERIMENTAL CONCEPT DESIGN - IDEATING, PROTOTYPING AND CONCEPTING

The second fieldwork day was for prototyping, testing ideas and finishing the concept idea presentation, a visual pitch of it, for the Friday.

FRIDAY – VISUAL PITCHES OF CONCEPT IDEAS INCLUDING A4DT ELEMENTS

Each student team had prepared a visual pitch presentation about their concept ideas. Pitching time was limited to ten minutes, and each team had to give constructive comments of the pitches in general, the concept ideas and the possible effects of using design thinking approach in them.

2.4 Hilversum case

The external client of the Smart Sustainable Cities project case 2019 was the Dudok Architecture Centre (DAC). DAC's mission is to increase public appreciation for architecture and spatial heritage in Hilversum, where the work of architect and urban planner *Willem Marinus Dudok* (1884 – 1974) serves as a main source of inspiration for DAC.

About a century ago, the town of Hilversum, which is now the hotspot of Dutch radio, television, and other electronic media, grew rapidly. Dudok was in charge of designing the

necessary urban extensions at the time. He based the design of the urban extension on the principles of the Garden City, made famous by, amongst others, Ebenezer Howard[2]. Through a social housing program, Dudok contributed to the increase of people's quality of life. Schools and libraries were planned in order to disclose knowledge to all layers of the population. Public amenities were included to make the city safer, cleaner, and healthier. In the 1920s and 1930s, administrators, architects, and urban planners from all over the world came to Hilversum to see how the town was being developed.

In the year 2020, the DAC wants the students to investigate what it could mean for Hilversum to become a 'Garden City of the 21st century': what does it take from several perspectives - residential, labor, health, networks, infrastructure, monuments, climate and energy - to convert Hilversum into a city that - again - attracts people from all over the world to contemplate the latest developments in sustainable urban development? Now that Hilversum can no longer expand, due to the surrounding nature, focus might be on innovative energy strategies, integrated sustainable development and a 'media city' profile in which working and green space have been integrated with a healthy living environment. DAC explicitly asks for speculative exploration of possible futures, not only based on today's knowledge, but especially on investigation and exploration of new horizons that may not be feasible right now but stimulate creative thinking about sustainable futures. Preferably, students should focus on innovative solutions of the three primary challenges for the near future: climate, energy, and food and how these relate to living, working, infrastructure and health. Principles of Ebenezer Howard's theory of the Garden City should be revived by confronting them with today's challenges and urgencies.

3. Results

3.1 Students' output from design thinking week

Student teams were about to utilize the smaller tasks during the week for the concept ideas and the visual pitch of the three chosen concept drafts.

The students who went for observing the target area (neighboring town) and met the people there, found more opportunities to study of and design for, than the students who relied only on the memories of their earlier visit there, which was done without the holistic and human view awareness of the design thinking introduction and workshops.

[2] See Sharifi (2016) for more information on the garden city concept.

Figure 2: Examples of concept drafts delivered by the students.

3.2 Students' project outputs

After the design thinking week in the project phase of the course, student teams produced the following outputs: project plan, the final project presentation, and the final project report. In these outputs, teams presented, among other required things, the selected and used methods for the research. Teams chose the methods by themselves and by approval of the tutoring teacher. Each of the five teams had a different tutor. Even though, the assignment was to design concepts for the future needs, design thinking was regarded as one research method in many. So, it was not necessarily selected as a research method. Still, since the task was to create visioning concepts for the future, design thinking elements were somehow present in working. On the other hand, from the design thinking point of view, the importance of human aspects also can be easily neglected.

3.3 Students' experiences - two surveys

There were two simple surveys conducted among the students to get insight in their experiences of design thinking and applying it both in exercises (A4DT) and the Hilversum project. The first survey was about the design thinking week itself, and the second one in the end of the project and the whole course. The response rate for the surveys was quite low: in the first survey 30% (8/27 answers), and in the second 44% (12/27 answers). Even though, the response rate could have been much better, from the qualitative point of view, the surveys gave understanding of the students' viewpoints and some perspective for developing further.

Survey 1. SSC 2019 - wk2: Design Thinking

The first survey was about the design thinking approach in general and the execution of the design thinking week. Students were asked about their study field, earlier experiences or knowledge of design thinking and about how was the week's program from their point of view.

Of the eight survey repliers four were studying engineering, two business, one design and one sustainable development. Half of the respondents already knew something about the

design thinking approach before the course. The design thinking week included some introduction lectures and workshops. Five out of the eight repliers regarded the lectures useful for the SCC minor and the project and six of them regarded the workshops useful. Following A4DT steps during the week were regarded as good way to build understanding of design thinking and especially the user point of view. One respondent liked the final concepting assignment but felt that not all students understood how the earlier exercises paved the way for the concepting assignments. The main critique was about the intro lectures being too long and taking too much time of the workshopping exercises.

So, as the students came from different backgrounds with different experiences and knowledge base, there were also contradicting opinions of the success of the design thinking week. Still, most of the repliers felt positive about the week, and all open answers gave input for further developing the course.

Survey 2. SSC 2019 – the Hilversum project

The second survey was about utilizing design thinking in the course project work, the Hilversum case. The survey started with the same basic question about the students' field of studies: five engineering, three business, one design, one sustainable development, one sustainability and economics, and one facility management student. The first subject question asked: "Would you say, you applied Design thinking approach in the Hilversum project ("A4DT", "Double Diamond", "Stanford D.school" - models etc.)?" Eight out twelve students replied: "YES". The following questions were about "WHY and HOW?". The answers were various: few emphasized the human viewpoint and working with the personas, few for identifying the problems and needs, some the prototyping and some just as a good structural base. For the four "NO" answers explanations were about forgetting to use it by being too immersed in the project to not feeling that it suits very well for the project in hand.

The following fifth question "Did you apply following methods in order to successfully execute your project? You can pick several options." opened the design thinking with twelve individual methods. Totally 60 alternatives were selected. The alternatives are in listed in Table 1.

Table 1: Survey 2. SSC 2019 – the Hilversum project "What design thinking methods were used?

Design Thinking method	n	%
Search for the right needs (need finding) before creating solutions	7	58%
Observe the (Hilversum) surroundings	9	75%
Observe people and their behavior (in Hilversum)	7	58%
Talk with / interview / listen to people (in Hilversum)	6	50%
Share ideas to people (in Hilversum) for communicating with them	2	17%
Apply Personas & scenarios in testing ideas	7	58%
Apply Empathy map in testing ideas	1	8%
Share created Personas & scenarios to people (in Hilversum) for communicating with them	1	8%
Prototype (material / immaterial) for testing, understanding and/or communicating	4	33%
Share prototypes to people (in Hilversum) for testing or communicating with them	4	33%
Create alternative concept ideas before choosing the final one	11	92%
Test concepts with people (users)	1	8%
Something else, you would like to share with us?	0	0%

Some methods are more general and some more namely as design thinking or design methods. Still it indicates that students have applied design thinking more, than they have realized themselves. It also becomes clear that design thinking methods in the later stages of the approach, such as prototyping and concept testing have been used less (probably because of time constraints).

The sixth question "For the project execution & results: How useful / beneficial were the previous or some other design thinking methods and tools that you applied, on scale 0 to 5?" followed with the open replies for the seventh question "WHY, HOW and WHAT?". Half of the repliers assessed the usefulness as 3, the average being slightly above, 3,17. One answered the maximum 5 and none the minimum 0. Many open word responses regarded it useful because of the human viewpoint:

"Searching for the right needs, observing and interviewing were helpful to find out the real needs and current situation of Hilversum (´s citizens)."

"Very useful, because we really listened to the residents and visitors and observed the city instead of only working on our ideas."

"The creation and application of personas gave me more empathy for future users of concepts and their needs, especially how most of the needs can be met by applying an overall concept."

"It is important to design for the actual users of the concept/product and find out how many people would actually be interested in it."

"It was crucial to find the needs of residents."

Also, few responded that design thinking framework gave a useful structure for the project and that prototyping was a good way to communicate with the people:

"Showing a prototype in the form of infographic was easier for them to grasp the concepts"

"Making an actual prototype of the design helps in showing people what you mean and bringing all the ideas together into something visual"

The last (voluntary) question asked for "suggestions to improve the SSC-minor from the Design thinking perspective". In the students' eight responses few asked for a clearer explanation about the benefits, for example by using more examples of how design thinking can lead to better results:

"It could be more clear from the start that this is a really useful method for a project."

"Talk less about models and more about examples of original ideas and how design thinking leads to innovation…"

"Connect design thinking tasks more to the project."

"…to show the students that they can and maybe depending on the task really should use the design thinking approach."

3.4 Other reflections

Students' feedback for the applying of the design plugin and A4DT design thinking approach has been supportive: rather than following lectures on the subjects, students like to work in multi-disciplinary projects and for the real companies' and organizations' needs. Finding the real needs and opportunities based on the human and holistic perspectives and experimental concept ideating is a revealing experience: creativity – the connection making – grows naturally by the process of sense making. Based on that understanding and insights, the alternative solutions for the given challenge can be easily justified. Contrary to these positive experiences there are also some observations that challenge the application of this type of design approaches. For Example, it was not self-evident that students will apply design thinking approach for their project work, despite the fact that design thinking skills are part of their 'tool box' lectured during the program. Students easily stick to a more traditional linear waterfall approach because they are more familiar with that.

4. Conclusion

It is clear that design thinking gets better understood by more doing and less talking about doing. Even though, sometimes students expect lecturing, keeping the lecturing in minimum and concentrating on meaningful project assignments and smaller tasks that apply the theories behind, leads to insights and deeper understanding of subjects. As A4DT model can be introduced and reasoned quite quickly (below), there is still need for developing the different ways of applying the model and its viewpoints.

> *HUMAN*: You are not an expert of everything, especially of other people's experiences and emotions: you need ways for better understanding of other people's experiencing, and it happens by communicating and doing together with people.
>
> *HOLISTIC*: Connect to the real world: isolated ideas work only in isolated world, which does not exist.
>
> *EXPERIMENTATION*: Experiment and prototype with people quickly: failing fast is not failing at all!
>
> *CONCEPT DESIGN*: Create alternative concepts from the alternative points of views and for the alternative future possibilities based on the available, collected and created data: concrete design concepts with prototypes are much easier to communicate and learn about than big amounts of raw data.

Designing and executing a large course, such as the case course Smart Sustainable Cities, requires expertise from several fields, which all play important roles in the whole. Since the SSC course was designed in an international and multidisciplinary collaboration, it requires many compromises, and continuous developing by smaller and bigger experimentations in each course implementation. As the subject is complex and requires multidisciplinary approach, the developing the implementations is challenging too. While design thinking is not actually a research method, it is easily expected to be as such. That way it is also easily misunderstood among non-designers, who may have totally different mindsets for the research and problem solving.

One conclusion of this paper is that design thinking should rather be the approach that frames the whole course and especially the project challenge. As the main framework of the SSC course, design thinking could improve the coherence of the course and easy-to-understand perspectives for the sensemaking of the complex subject. A4DT – Approach Four Design Thinking, would serve as a framing model for the whole course, and the process models, such as Stanford D.School's Design Thinking Process or Design Council UK's Double Diamond (Van Patter & Pastor, 2016), could give structuring for different tasks, assignments and projects as parts of the course.

Codesign as an operative framework for Responsible Research and Innovation: the case of Krakow Technology Park

Felicitas Schmittinger[a], Francesca Rizzo[a] *, Alessandro Deserti[a]

[a]Politecnico di Milano, Department of Design
*francesca.rizzo@polimi.it

Abstract
The governance of emerging science and innovation has been conceptualised as a major challenge for contemporary democracies. Responsible Research and Innovation (RRI) emerged to tackle this issue by placing an emphasis on broad public engagement in the field of policy design based on the early involvement of multiple actors - citizens, civil society, researchers, industry, public sector and policy makers. Nevertheless, such early engagement is facing many challenges and it rarely goes beyond the stage of consultation (Grimpe, Patel, Wilford, Niemelä & Ikonen, 2013; Delgado, Lein Kjølber & Wickson, 2010; Chilvers, 2008). The SISCODE project, funded under H2020, identifies the application of co-design approach to overcome this challenge. This paper documents the experimentation conducted in one of the SISCODE living pilot in Krakow to support a public engagement action between policy makers, citizens and stakeholders. Addressing the acute issue of air pollution in Krakow led to a strategy of ecosystem activation applying co-design involving a variety of actors with a twofold objective: co-designing a policy as a prototype and experimenting with it through a process of development of tangible solutions.

KEYWORDS | CO-CREATION, CO-DESIGN, POLICY DESIGN, RESPONSIBLE RESEARCH AND INNOVATION, PILOTING, BOTTOM-UP INITIAVES

1. Introduction

The influence of science and technology on people's lives has been increasing continuously, certainly providing unprecedented benefits to humanity. Science is focusing its research effort on a wide set of Key Enabling Technologies (World Conference of Science, 1998), which are not only very important for innovation processes and therefore for industry and the technological players, but also for society and individuals as well, enabling solutions for specific and global challenges and changing societies, economies and working conditions. Significant impacts have already been generated in fields like health, quality of life, operations in the domestic, urban and wider environment, in transport, services and industry as well, which has a wider impact on consumers and markets. However, hand in hand with these developments, a considerable degree of public mistrust of science and fear of technology has been building up among different population segments. It is related to the fear of some individuals and communities that they will be the ones to suffer some direct and indirect negative consequences of technical innovations, which are being introduced to benefit only a privileged minority. In certain circles, citizens face scientific assessments and statements with suspicion (Wynne, 2006; Palliser & Dodson, 2019), since they fear the bias of possibly partial evaluations and impacts. European institutions have since long recognised the importance of developing and intensifying the relationship of science and technology with citizens and stakeholders, involving them in the knowledge sharing, priority setting and in the co-creation process. This started in 2001, when the European Commission published a Communication setting out the Science and Society Action Plan, the EU interventions to shorten the distance between Science, Technology, Innovation (STI) and citizens it continued with the Science in Society strategy and finally developed into the Science with and for Society (SwafS) programme and Responsible Research and Innovation (RRI) themes in Horizon 2020. This strategic setting has deepened the discourse on Public Engagement (PE) and Responsible Research and Innovation (RRI), demanding the deep involvement of multiple actors throughout the entire process - citizens, civil society, researchers, industry, public sector and policy makers - in science and innovation (Jasanoff, 2003; Owen et al., 2012; Meijer et al., 2016).

Narrowing the focus citizens are one of the key sources to establish the priorities and to guide the development of solutions and therefore it is necessary to establish a structured and regular dialogue with them and with stakeholders, facing the challenge of going beyond a mere communication effort and putting in place mechanisms to engage citizens in a science-society co-creation action of priorities, expectations and concerns shifting the role of the public from consultation towards real co-creation.

A useful approach to be applied to operationalise these twofold objectives is co-design (Bason, 2014; Brown, 2009; Sanders and Stappers, 2011; Deserti & Rizzo, 2012).

Over the last 10 years, co-creation has emerged as a significant novelty especially with the diffusion of Social Innovation (SI), a bottom-up process - social in its means and in its ends - in which social innovators, creative communities, citizens, vulnerable groups and civil servants co-produce the solutions they need at the interplay of state, private sector and civil society (Terstriep et al., 2015), tackling complex societal challenges (social inclusion, employment, migration, climate change, etc.). As the results of the SIMPACT, SIC, SI-DRIVE, Transit and Transition EU projects among others have pointed out, co-creation is an inherent part of SI. SI develops in co-creation ecosystems (Terstriep et al., 2015), as described by the

quadruple helix model (Committee of the regions, 2016; Carayannis et al., 2012) and often adopts design approaches, methodologies and tools to start from situated problems and develop solutions through a process of co-design and co-production engaging all the affected actors. In these contexts, co-creation starts from the needs, competencies and experiences of each actor, and strives to set up new modes of interaction that will flow in new assembly and network configurations. If well conducted, the process may lead not only to the generation of new solutions, but also to the reconfiguration of the same socio-technical system where it takes place. In other words, change occurs not just at the level of the outputs or single organisations, but across the entire ecosystem within which co-creation occurs. This overall system - which could be described as the complex combination of ideas, institutions, regulations and policies - constitutes at the same time the environment where more responsible approaches to science and innovation can unfold, and the result of their diffusion.
In this paper the authors present results of the SISCODE H2020 project. In particular, the paper describes and discusses results from the long terms experimentation conducted in Krakow where the Krakow Technology Park, as a project partner, led a project of the co-design of new solutions and policies to face the issue of air pollution in the Małopolska Region where the city is located. The results obtained from the experimentation show potentialities for co-design to become one of the most suitable approaches to shorten the distance between STI development and the society's needs and challenges.

2. The Project SISCODE

The SISCODE project (www.siscodeproject.eu), funded under H2020 and coordinated by the Department of Design of the Politecnico di Milano, aims to further push the frontier of the vision of RRI based on the principle of inclusiveness, involving all actors at an early stage, allowing innovation and STI policies to be conceived in a co-building mode in order to ensure shared responsibility. SISCODE aims at establishing, testing and validating 10 pilots across Europe as co-creation ecosystems (European Commission, 2016), which actually shape the scientific and innovation process and demonstrate the effectiveness of real involvement of societal stakeholders in the acceptance and use of STI in everyday people life.

2.1 Co-design as a framework to operationalise co-creation in Public Engagement and RRI

To reach the project objectives SISCODE have adopted the co-design approach, methodologies and tools that already have shown to be one of the most suitable knowledge domains to practice co-creation starting from situated problems and developing solutions through a process of co-design and co-production engaging all the affected actors. In these contexts, co-creation starts from the needs, competencies and experiences of each actor, and strives to set up new modes of interaction that will flow in new assembly and relationship configurations. The role of the co-creation pilots is to experiment with design methodologies and tools as an approach to shorten the distance between ideation and real implementation of solutions and policies (implementable co-creation). The

experimentations verify the hypothesis (and will produce knowledge) to make RRI implementable by introducing design methodologies and competences in the organisational, institutional and policy domains where it develops. The introduction of new knowledge and competences is expected to trigger transformations in the co-creation ecosystems to overcome the barriers and constraints to the real implementation of RRI. As the experimentations in the pilots proceed, the project aims to further verify the hypothesis of the application of the design process as a learning framework for policy makers to reconnect small-scale experimentation in real contexts with high level policy design.
The SISCODE system of pilots will represent a space where policy makers experiment with a design-based learning framework. SISCODE is based on the hypothesis that the introduction of effective co-creation in RRI and PE should be primarily based on its practice, or else on a learning-by-doing framework that can be complemented with reflection to achieve a sustainable transformation. This is not only in line with generic organisational learning principles (Cohen & Levinthal, 1990; Senge, 1990, Wenger, 1998, Bouwman & Grimmelikhuijsen, 2016; Beckman & Barry, 2007) but also with the way in which design knowledge and culture is built, which is historically bound to practice. In such a setting, the role of prototypes and context-based experimentations, core ingredients of the co-design approach, can be regarded as key for developing co-creation knowledge and for its appropriation in the field of policy making. The scheme in Figure 1 represents the SISCODE learning framework (Rizzo et al., 2017).

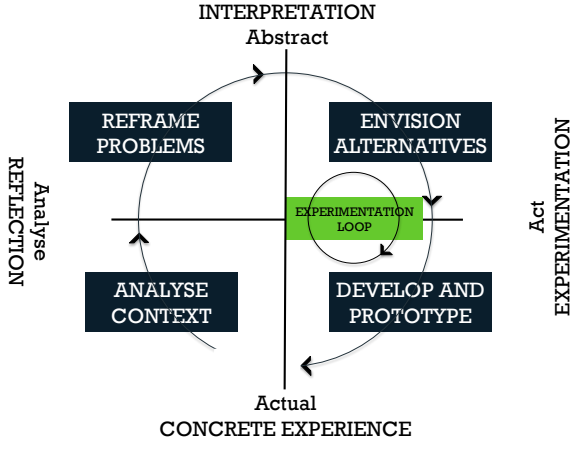

Figure 1. SISCODE design-based learning framework

2.2 SISCODE methodology for pilots' implementation

To implement this learning framework SISCODE proposed a design-based methodology to be applied in each of the single pilot projects run within the project. The use of design tools and methodologies have been defined in a modular toolbox composed of different tools for each of the phases in the design cycle to put co-creation in practice in all the pilots notwithstanding the differences among their specific challenges.

The methodology is put in practice by 10 co-creation pilots across Europe as real-life experiments. Each pilot follows a co-creation journey previously defined within the project and depicted as a scheme in Figure 2.

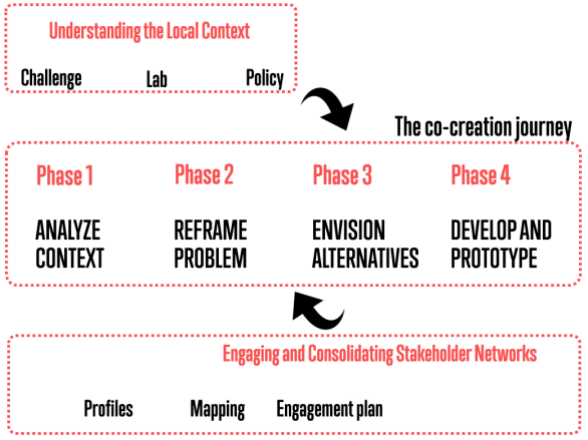

Figure 2. SISCODE's co-creation process proposed for the pilots

Starting from an analysis of the local situation, citizens and the policy environment, an initial challenge has been defined for each pilot based on the local context and the already existing relations with local authorities and policy makers influencing mainly the first three phases up to the ideation phase in which alternatives are envisioned. Throughout the entire process, stakeholders were to be identified, mapped and involved from the analysis until the prototyping phase. Each of the four phases contains activities defined by the pilots when drafting their co-creation journey. Those activities are again interrelated with specific design tools varying for the different pilots depending on their challenge, context and environment. In the following, one of the ten cases is represented in detail describing the co-creation journey, the ideated solution and individual reflections on opportunities and obstacles identified throughout the process.

4. KTP – Krakow Living Pilot

Situated in the Polish city of Krakow, the Krakow Technology Park (KTP) is a joint venture of State Treasury, the Municipality of Krakow, the region, various universities and the largest steel producer in Poland. Its main focus lies on the local development of the surrounding Malopolska region with an emphasis on technological development and innovation providing direct support to businesses. Their living lab has already experimented with co-creation, mainly from a business point of view and involving users and stakeholders mostly in the final phase testing already developed products. When required by the client, also wide

ranges of stakeholders have been involved in various stages throughout the development process of past projects. In the context of SISCODE, KTP has been involved with 2 specific aims: working on relevant societal challenges and involving a consistent group of stakeholders to identify together a potential solution to experiment with.
KTP has decided to work in partnership with the Malopolska region and the city of Krakow to tackle air pollution as one of the biggest issues for the region and its citizens.

4.1 Challenge analysis

Starting from the challenge of the air pollution the first activity that KTP has conducted with the regional authorities has been to analyse and reframe it into a problem where citizens could have an active role as co-designers.
Pursuing concrete goals in terms of lowering emission consist of a few different dimensions such as industrial pollution monitoring, development of the system of public transport, providing alternatives for traditional heating systems. One of the most important factors are the citizens of the region and their behaviour regarding everyday activities like heating and mobility. This reduction of emissions shall be dealt with by mobilizing residents.
Based on this premise KTP aims to create a space for stakeholders, policy makers and citizens to co-design a policy that includes citizens and motivate them to change attitude and habits in order to reduce air pollution. With a strong focus on air pollution and mobility, the challenge is a part of the new Air Protection Programme of the region for 2021-2030.

4.2 Co-creation journey

To tackle the previously described challenge, a co-creation journey based on the SISCODE approach has been developed by KTP splitting the single phases in activities and assigning specific tools of the SISCODE toolkit to be applied during these activities as well as addressing expected outcomes as a guideline for the experimentation (Fig. 3).
The results from the execution of this journey are described successively with a strong attention to the outputs of the single phases and the step-by-step development of the prototype.

	Activity	Tools	Expected Outcomes
1. Analyse Context	1.1 Desk Research	Desk research, Key facts, Interviews, Research participant map	Outline of the local challenge Varied stakeholders list
	1.2. Interviews with relevant stakeholders	Interest Groups Discussion Research Planning Survey Activity Network	Participants on board Data/ information collected, pilot for further analysis Outline of the perspectives of key stakeholders regarding the challenge
	1.3 Synthesize & analyse data	Initial opportunity map Trends matrix Convergence map Buzz reports	Situational analysis Map stakeholders Identification of trends and initiatives Repository of ideas and solutions Initial Report of this phase

	2.1 Understand the data collected	Mind mapping Insight clustering matrix Persona definition	Outline of the clear vision of the local challenge Data summary and visualisation
2. Reframe Problems	2.2 Aligning the pilot concept with knowledge gathered	Comparative analysis Concept sorting Concept scenarios	Realistic / feasible defined problem/ challenge Report on the chosen local challenge
	2.3 Frame opportunities	Brainstorming exercise Best practice identification	List of possible opportunities
3. Envision Alternatives	3.1 Idea generation	Brainstorming exercise Convergence map Soft „hackathon" / Design challenge	Summary of tenable ideas
	3.2 Idea selection	SWOT analysis Concept sorting Solution evaluation Concept grouping matrix	Summary of the selection of the appropriate idea
	3.3.Generate a concept	Concept scenarios Persona definition Solution roadmap	Report of solutions and policies (D3.2)
4. Develop & Prototype	4.1 Concept development	Solution storyboard Description of prototype Competences plan Strategy roadmap	Fully elaborated and detailed concept with outlined operational plan
	4.2 Prototyping	Solution prototype Solution Enactment Pilot development and testing Implementation plan	Report on the tested prototype

Figure 3: KTP's definition of their co-creation journey

Context analysis

The context analysis has been carried out starting with a desk research on the current status analysing reports and official documents as well as already active policies. The challenge has been discussed and refined iteratively in various meetings with stakeholders and policy makers on the basis of the data coming from the analysis of the context. Furthermore, an opening meeting with more than 220 stakeholders attending brought together keynote presentations, moderated discussions and Q&A's. The challenge has been refined and narrowed down in the end of this stage leading to the following objective:
How to improve the quality of the air in Krakow by motivating citizens and supporting decision makers with relevant co-creation tools and instruments?

Reframe problems

Based on the analysis and the narrowed challenge, workshops have been conducted aimed at refining the problem to be addressed. The direct output of the workshops were personas and empathy maps representing the target to be addressed with the upcoming solution. Apart from the methodology and exercises of the workshops, a particular focus has been set on advertising and reaching out to potential participants in order to gather representatives of all relevant stakeholders. The work initiated with the officials of the region in charge of

developing the new Air Protection Programme has been brought forward mainly carrying out open consultation meetings with KTP functioning as a facilitator and mediator. Citizens have been engaged in workshops in order to better analyse their needs and potential opportunities in reaching out directly to single citizens.

Envision alternatives

Collaborating closely with the region, the legal document in development defining the Air Protection programme (needed to officialise the rules, restrictions and actions to be taken by the industry for the following years) has been decided quite early to be a fundamental element of the prototype of KTP. The policy has been then developed with experts and citizens by activating a campaign to inform the policy itself by hearing from the citizens. Here co-design workshops have been implemented involving sufficient numbers of citizens directly inviting and involving specific local communities in order to get a better understanding of the perspective of citizens and their daily challenges.
Targeting the citizens on the other hand it has been decided to develop a more tangible solution to make the policy more visible and understandable with and for the inhabitants of the affected region. Co-design workshops have been conducted specifically oriented at envisioning concrete solutions based on SISCODE canvases leading to new insights.
From the numerous gathered ideas, eight of them have been selected and given into the hands of policy makers for further refinement and implementation. All of them have been taken into consideration by the experts preparing the first draft of the Air Protection Programme and have been used as a base for a Smogathon.

Develop and prototype

The drafting and finalisation of the document for the air protection programme mainly requested various consultation meetings uniting stakeholders and mediating between actors defining the legal boundaries and procedures needed to launch the official document. The draft has been published and presented to all interested stakeholders collecting feedback to then prepare a second version. In parallel, a Smogathon organised by the Municipality of Krakow and KTP developed a prototype of an app for end users to deal with the issue of air pollution. The winning project – a platform supported by an application and a monitoring system for industrial pollution - is to be developed and tested first in one county and subsequently with a broader public.

Effective Stakeholder Group	Level of engagement			
	Co-Producing	Co-Designing	Consulted	Informed

City of Krakow, Air Quality Management				×
The Metropolitan Association, Krakow			×	×
University of Science and Technology		×	×	×
Krakow University of Technology		×	×	×
Krakow Smog Alarm Activists		×	×	×
ICT companies, SMI's, Start-ups		×	×	×
Media/wider public		×	×	×

Figure 4 Stakeholder engagement

Throughout all phases, various stakeholders have been involved at different levels of co-creation, ranging from being solely informed to co-producing solutions (see Fig. 4).

4.3 Final solution and outcomes

The final solution consists in two components, the first one is a legal document defining the rules and restrictions of the new Air protection programme of the Malopolska region and can be defined as the legislative frame more addressed to the industry and politics while the second element is a web platform connected to a mobile app and specific monitoring instruments that has the main goal of informing citizens and making them aware of the single contribution each of them can make. Both components of the solution have the common goal to reduce air pollution in the Malopolska region.

1. Air Protection Programme for the Malopolska region
The document for the Air Protection Programme officially applies rules, restrictions and indications for the industry on how the reduction of the air pollution in the region in the following years is to be achieved. Its development included 6 open consultation meetings with over 250 participants representing the various groups of interest.

2. Multichannel solution to provide transparent information on industrial pollution and raise awareness among citizens
The prototype consists of a web platform, a mobile app and monitoring instruments whose functions have been co-designed during the various workshops. The implementation of the solution itself is being carried out in a co-production process that involves the pilot, different stakeholders from the county and region, policy makers and the winners of the Smogathon to make certain that all involved parties have the possibility to express doubts and contribute to the final service.

4.4 Transformations, outcomes and reflections

Malopolska is the first region in Poland having started to update the regional Programme for Air Quality Improvement laying a foundation for the other regions with a strategy of activities and specific tasks, actions and obligations representing and considering all affected actors. The co-creation process itself sets new standards for the public administration and policy makers and for the citizens.
With respect to the public administration and policy makers one need identified throughout the entire process of co-designing solutions has been the necessity to provide clear and easy support instruments and tools, that are not too abstract for them completely new to design practices. Tackling such a complex problem as air pollution in a co-design mind set has been found challenging to not only involve all interested parties, but also to consider their interests and needs in all moments throughout the process. Also, the restrictions arising from operating in the field of legislation and law have been limiting the freedom of action

adding a further layer of complexity. Despite the immense challenge it laid out, the co-design approach did succeed in supporting the alignment of the various stakeholders leading to a realistic and implementable solution and the failure of past experimentations exclusively applying top-down approaches to avoid this complexity have not produced satisfying outcomes (Pressman & Wildavsky, 1973; Van Meter & Van Horn, 1975).
However, as an outcome of the numerous workshops with stakeholders and citizens, KTP managed to elaborate a list of policy gaps identified in these working sessions analysing them and elaborating suggestions and recommendations on how each of the issues could be tackled. Furthermore, as a result of the positive feedback on the workshops and the methodology applied there, the region decided to conduct more co-design activities in a different project rolled out at national level. The positive feedback from the regional authorities and their proactivity to apply co-design can be perceived as an enormous success and an important step towards the implementation of consultation processes.
With respect to citizens it emerged how much they are willing to introduce changes in their behaviours and more than this willing to collaborate with public actors even though they are often already discouraged by previous experiences and administrative barriers which can hinder involvement and lead to initially scarce participation. The results from the pilot seem to suggest a positive effect of the co-design approach experimented in SISCODE as the outcome of a process of involvement (from problem definition to solution co-production and experimentation) on the actors' engagement. This type of engagement has received very positive feedback and seemed to have also positive effects on the acceptance of the final solution when the citizens participated in its development and currently in its experimentation.
A first general reflection that the authors can draw from these results is that co-designed solutions might be more likely to be accepted both by citizens and policy makers if those have been actively included in their development and were given the opportunity to discuss problems and needs. The different workshops run during the pilot development (from analysing the problem to co-designing the solution) functioned as a space for discussions appreciated by all participants.
Furthermore, the process of engagement of different stakeholders along the entire process of development of the solution suggests two additional reflections.
First, co-designing a policy implies the engagement of different levels of governance from the local to the regional one and asks for overcoming silos that are still in place in traditional policy design processes. On the basis of the indications coming from the pilot the co-design approach to the policy development allowed the Malopolska region governance system to experiment with a more holistic approach to local and regional sustainable development. Specifically, co-design in workshops enabled policy makers from the different governance levels to gain an in-depth understanding of the barriers, drivers and issues that affect a policy implementation at each level. This understanding supported the policy makers from to develop a more coherent solution to the requirements that governance posed.
Secondly, the involvement of the citizens in the process of policy design rarely can move from public hearing if it is not supported by some level of tangibility and materialisation of

the policy itself. With this respect the pilot results show the benefit that the implementation of a prototype as a service for the involvement of the citizens in the monitoring of the air pollution shortened the distance between the policy and the acceptance of its expected impact/s.

5. Conclusions

The design-based methodology and tools for co-creation applied in the SISCODE project succeeded with respect to the general project aim to introduce in RRI a practical based approach to operationalise it. By putting together science, innovation and technology potentialities with the needs coming from the society in a process of co-design of solutions seems to be promising with respect to the advancement of the more traditional mechanisms of public hearing and consultation that are still prevailing in policy design field.
The importance of the co-design tools and their appropriateness and adaptation for the specific KTP case has been stressed as a fundamental point for successful co-creation in the context. At the same time the application of a co-design process to policy design has pointed out the complexity of a collaboration that must proceed from bottom up (citizens and stakeholder) to top down (governance levels) and vice versa encountering barriers that depend on cultural, economic, legal, societal and regulatory factors that are in place and can prevent real co-creation to occur.

Designing community: creating resilience through collaboration

Jessica Clare Robins*[a], Emmanuel Tsekleves[a], Leon Cruickshank[a]

[a] Lancaster University, UK
*j.robins@lancaster.ac.uk

Abstract | Community must be placed higher on the circular economy agenda if a truly sustainable future is to be realised. This paper will explore the changing definition of community, looking at previous classifications and modern thought to attempt to provide an up-to-date definition that is fit for the future of our multifaceted, complex society. The paper will argue for this new definition to be included as part of the discussion around the circular economy. The research shared in this paper are the initial results from a project that is attempting to make visible and tangible the connections and communities that circular economy organisations are part of. By making visible the connections this research hopes to encourage the design of community as an integral part of the circular economy and a resilient future. The paper will conclude by arguing how the results will contribute to the field of circular economy research.

KEYWORDS | COMMUNITY, CIRCULAR ECONOMY, RESILIENCE, SOCIAL CAPITAL, CONNECTION MAPPING

1. Introduction

Today's society needs to build on community connections more than ever. If the wicked problems facing humanity are to be tackled to bring about a more resilient society then a collaborative community-based society is needed. Designers have the skills and knowledge to intervene and deliberately design community to be stronger and more resilient to the changes being brought about by the climate crisis. This paper responds to the *Design Culture (of) Resilience* track, making its particular contribution through offering a new definition of community for use in a circular economy and a more sustainable future. Through exploring the initial results of a research project, the authors will demonstrate the importance of collaboration to circular economy organisations and how these collaborations and communities can bring about a more resilient future.

2. History of community

This section will explore the history of the term 'community'. If a new definition is to be suggested, then it is important that the term is contextualised, and a thorough examination of the changing definition is explored.

Prior to the Enlightenment there was very little to separate the notions of community from society. Society, at this time, could be seen as a series of contractual agreements related to politics and economics; this was often how friendship and kinship, the basis for community, was also seen (Delanty, 2010).

2.1 Enlightenment to modernity – belonging

It was not until the late 1800s that a distinction between community and society started to be made. From this period onwards, throughout most of the 20th Century, community was theorised in three ways: nostalgia for a 'lost' ideal that has been destroyed by modernity; a loss that can be recovered and realised; or an idealised future utopia to be achieved (Delanty, 2010). These differing theories are all linked by one key thread, that community provides a sense of belonging.

Some scholars in this period saw community as intrinsically linked to a 'traditional', rural way of life that had given way to modernity and life in the city, often referred to as society. Social groups, and the relationships that come from these groups,

> "may be conceived either as having real organic life, and that is the essence of *Community*; or else as a purely mechanical construction, existing in the mind, and that is what we think of as *Society*" (Tonnies & Hollis, 2001, p. 17 original emphasis)

Once 'community', made up of social relations, had been lost to the mechanics of society, there was no way it could be recovered.

The total loss of community to society is an idea that has been robustly criticised by many subsequent scholars (Delanty, 2010). There was a recognition of the conflict between tradition and modernity, however, there was a strong argument that the cities of modernity were not as isolating and self-absorbed as previously made out.

> "There is in our contemporary societies a truly collective activity which is just as natural as that of the smallest cities of previous ages" (Durkheim & Giddens, 1972, p. 5)

Modernity saw a raise in the ‘cult of the individual’ (Durkheim & Giddens, 1972), which argued for self-determination, allowing individuals to practice ‘organic solidarity’; the freedom to choose communities based on personal interest rather than geographic or familial ties; communities formed by a conscious collective. The third way to view community, that of a utopia to be achieved, was a theory favoured by left-wing scholars such as Marx (Delanty, 2010). The definition of community laid down by this paper is focused on active, existing communities, so is not the place to discuss these ideas.

2.2 20th Century - communication

During the 20th Century ideas around community became more focused on communication as a central part of community formation. Research from the Chicago school described city-based communities as "a mosaic of little worlds” (Park, 1915, p. 608) where an individual could express different sides of their personality, "living at the same time in several different contiguous, perhaps, but widely separate worlds" (ibid). Within the city, individuals tend to be connected through 'communities of interest' rather than traditional, familial communities. Different types of community studies have grown out of these beginnings, such as political and activist community studies, or community as a place for state intervention such as welfare (Abu-Lughod & King, 1997; Hemphill & Leskowitz, 2013; Warren & Jones, 2015). The following section will focus on more abstract ideas of community, which will help to inform the definition of community proposed within this paper.

2.3 1980s - beyond ‘face-to-face’

In the 1980s a branch of community theory began to develop, moving towards community as an imagined concept, rejecting the idea of community based on social interactions (Anderson, 2006). Communities, rather, are developed through a shared, imagined connection, such as the nation or region. Mass communication establishes, reiterates and reaffirms the basis for the imagined community, enforcing and reinforcing the feelings of kinship among the community. There are subtle verbal and non-verbal communications that go into the creation and re-establishment of a community, it exists through symbols and signs that are adopted by the community and used to signify its boundaries (Cohen, 1985).

> "The reality of community lies in its members perception of the vitality of its culture. People construct community symbolically, making it a resource and repository of meaning, and a referent of their identity." (1985, p. 118).

A recent, specific example would be that of climate activist group Extinction Rebellion, they have a simple, recognisable brand that is easy to reproduce, a symbol of an egg timer in a circle (Figure 1). Wearing this logo demonstrates through visual communication to other members of the group that you are aligned with their ideas about climate change.

Figure 1: Extinction rebellion logo

This section shows that community is less centred on locative relations, but more imagined through self-identification re-enforced by signs and symbols. The ideas of community as imagined and bound by symbols becomes more significant as society moves into the age of the internet. The focus of community theory moves online, and the idea of networks start to become more important.

3. 21st Century – community and networks

As laid out in the previous section, a definition for community can be proposed for the pre-digital eras as: *providing a sense of belonging to an imagined structure, phenomena or group, whose boundaries are reinforced through verbal and/or non-verbal communication.* Within this definition we can include communities that an individual choses to be part of, and those that they in through circumstance (of birth, location, race etc). In communities of circumstance an individual still has the choice as to whether to be an active member of that community.

Communities become networked through each individual member, who has the autonomy to be actively involved as part of the conscious collective. Each of these members can be part of a number of communities, and as such, act as links between the different communities. In this sense communities can be seen as nodes in a wider network. The digital era makes communication between these nodes easier and quicker. Again, looking at the Extinction Rebellion example, this group has many communities across the UK working on their own local issues, but each local community node is connected and supported by the wider regional and national community. The individuals who make up each group also bring their own priorities for their area and can link the local and national groups to wider communities.

This section will look at how community theory has been linked with network theory and how this can start to influence our definition of community to incorporate issues of sustainability and resilience.

3.1 Degrees of separation

Linking networks and community theory can first be explained by exploring intrapersonal ties. An individual's social world is made up of many relationships based on either strong or weak ties (Granovetter, 1973). Strong ties are formed between people who know each other well, developed over a long period of time, such as family and close friends; weak ties, on the other hand, are connections established quickly and more superficially with people such as work colleagues or sports club members. Weak ties can be used to create 'bridges' to other communities (Putnam, 2000), links which can enable networks to be formed. Weak ties alone cannot make a community, however, the potential bridges created through weak ties can be essential for the survival of said communities. Strong and weak ties together can be seen as the basis for the formation of a community, although a community does not form randomly, "the relevant aspects of the social environment can be seen as a foci around which individuals organize their social relations" (Feld, 1981, p. 1060). These foci can be any number of things that draw people together, and weak bridging ties allow for a wide diversity of people to be brought in.

3.2 Social capital

Connecting a group of weak tie individuals around a focus will not create a lasting community, the ties have to be worked at and maintained. This happens though the development of social capital between community members. Social capital is a phrase used to describe an individual's worth to society through their intrapersonal skills, connections and networks. Individuals all have a level of social capital which is formed through connections with other people (Coleman, 1988). There are different types of social capital: bonding, bridging and linking (Halpern, 2005; Putnam, 2000). Bonding social capital is formed through strong ties and exists in closely linked groups such as a family or religious congregation. This type of social capital is good for mobilising solidarity among a specific community but can be exclusionary towards outsiders (Putnam, 2000). Bridging social capital, created through weak ties, is inclusive and outward facing, it facilitates the interaction of a diverse section of society. This type of social capital can be seen in organisations and clubs, it provides "better linking to external assets and for information diffusion" (Putnam, 2000, p. 22). This type of social capital can be seen to bridge different communities and provide links to other sections of society. Bonding is better for getting by and bridging is better for getting on. Linking social capital is concerned primarily with power, and who access to it. It is

> "the extent to which an individual's, or community's, networks are characterised by linkage between those with very unequal power and resources" (Halpern, 2005, p. 25)

Communities with low levels of linking social capital can be seen to be very unequal, where money and power are concentrated within a small group that is inaccessible to the rest of the community. There are three structures for the development of social capital: obligation, reciprocity and trust; knowledge and information; and norms and sanctions (Coleman, 1988). This can be explained by, if person A does something for person B then person A will

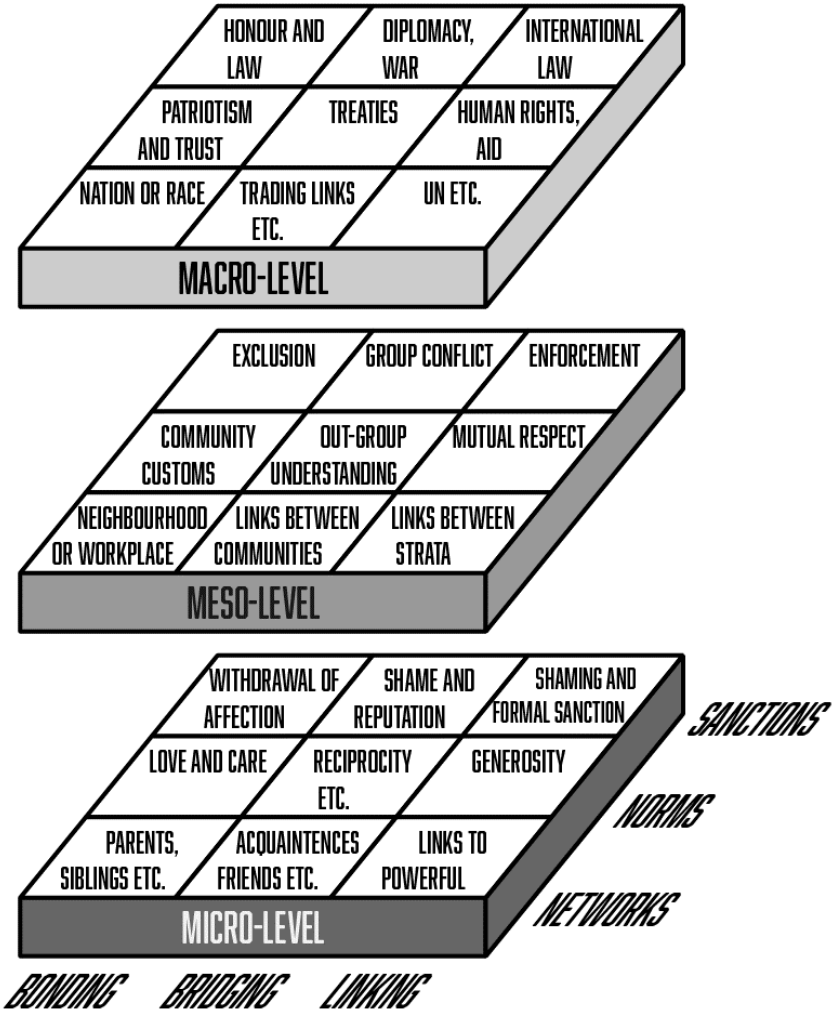

Figure 2 The types of social capital, their structures and how they operate at different levels

anticipate some kind of reciprocation from person B in the future, "this establishes an expectation in A and an obligation on the part of B" (Coleman, 1988, p. 102). Person A must trust that at some point person B will repay the favour or the reciprocity and social capital will be broken. He describes knowledge and information as important part of social relations. Person A might have interest in a subject, but not the resources or desire to learn about it in detail so relies on others within their social circle for information. Norms and sanctions describe the unspoken social rules that exist within a community (norms) and the rewards or punishments (sanctions) that are used to maintain these rules. Figure 1 explains how the different types of social capital operate through the three structures.

Bridging and linking social capital involves more initial risk but can create trusting links between individuals and communities. Social capital is very important the development of a new definition of community. Weak ties that create bridges are essential for building trust. Trust is an essential component in both bridging and linking social capital, it can allow for more access to power and money through stable political representation on every level (Rossetti di Valdalbero & Birnbaum, 2017).Weak ties that provide linking and or bridging social capital to individuals or communities are essential to create resilient, 21st century communities. The challenges we face cannot be solved by being protectionist and inward facing, they are global in nature and a global view must be taken to tackle them. Mass communication can be mobilised to educate, share knowledge and create more empathetic imagined communities. This was demonstrated recently when communities of crafters were mobilised to make and send recovery nests and blankets for animals injured in the Australian bush fires (Paul, 2020). Communities that are open and outward facing must work together to see the wider picture and help one another to bring about change to create a more resilient world.

3.3 Communities of practice

Social capital does not form in just location-based communities. Ties be formed between individuals can be through a specific, deliberately formed community of practice. This is a term used to describe an often informal group that arises based on a shared expertise or practice. These communities "are not defined by place or by personal characteristics, but by people's potential to learn together" (Wenger, White, & Smith, 2009, p. 11). These communities often come together organically through shared desire to improve knowledge of a certain subject. Communities of practice can be seen as a space for an individual to build upon skills and knowledge by connecting to a group with similar goals and practices. Like social capital there is a strong element of reciprocity in communities of practice, people contribute to the pool of knowledge

> "while trusting that at some point, in some form, they will benefit. This kind of reciprocity is neither selflessness not simple tit for tat, but a deeper understanding of mutual value that extends over time." (Wenger, McDermott, & Snyder, 2002, p. 37)

The theory was developed in order to give a name to informal shared learning that develops around a specific interest or activity.

Communities of Practice are incredibly important in the move to a circular economy and the development of a more resilient and sustainable future. As their primary focus is to share knowledge and expertise, they are the ideal places for the development of skills for resilience. For example, to teach people the skills needed to keep products in use for longer, through repair cafes, tool libraries and maker spaces. The knowledge and skills developed through a community of practice has the potential to be disseminated to other communities the members of the community of practice are part of. Passing these skills throughout a network that is wider than the initial community of practice.

The communities referred to in this paper reach beyond communities of practice, as there is a space and a need for many different sorts of communities to engage with and advocate for a circular economy and more sustainable ways of living. Communities of Practice are a useful part of the network of communities referred to, and their purpose and expertise can benefit beyond their community boundary. The linking of communities of practice with other communities shows that their real benefit is as an intrinsic part of the networked nodes.

The next section will look at the circular economy in more detail and explore the need for an emphasis on community when discussing and working towards a CIRCULAR ECONOMY.

4. Circular Economy

There is little denying that human activity is causing the massive climate breakdown we are seeing at the moment (Berners-Lee, 2019; von Weizsäcker & Wijkman, 2018). However, there is a lack of acknowledgement humanities profound effect and that we are all connected (Smith, Kim, & Son, 2017). Despite increased scientific warning there is little strong action on the climate crisis and its causes. This is leading us into a culture of hand wringing and fiddling about the edges, with a push for individual change over corporate change, which leads to companies engaging in greenwashing to allow for business as usual (Hobson, 2019; Hobson & Lynch, 2016; PriceWaterhouseCoopers, 2008). The circular economy is a current trend with serious ambitions. This model and way of shaping the world could have profound effects on delivering a sustainable future. It is promoted as a panacea by academia and business alike, however the term is often used interchangeably with advanced recycling. To engage in a truly circular economy businesses need to fundamentally change the way they view resource consumption, planning for the continual reuse of every part of their product until it can be returned to improve the organic system. Consumers, too, need to be ready to take responsibility for the items they own, by keeping them in good repair and complying with systems of return and repair to keep the resources in use for as long as possible.

The circular economy is an economic model that promotes the constant reuse of resources for as long as they are materially useful before being returned to replenish natural systems. This idea has gained a lot attraction in business and academic circles (Ellen MacArthur Foundation, 2013; Geissdoerfer, Savaget, Bocken, & Hultink, 2017; Kirchherr et al., 2018; Mathews & Tan, 2016), pushed in the UK by the Ellen MacArthur Foundation. However, the adoption and implementation of this system has so far been scattered, with governments slow to follow business and academia's lead. To really make an impact the taking up of the circular economy needs to be full scale, with a consensus across business, politics and academia.

The circular economy will improve resource resilience by advocating for the continuous usage of materials that are already in circulation (Blomsma & Brennan, 2017; Ellen MacArthur Foundation, 2013; Gallaud & Laperche, 2016). It will improve natural resilience through the regeneration of our natural resources (Ellen MacArthur Foundation, 2019; Principato, Ruini, Guidi, & Secondi, 2019; Slorach, Jeswani, Cuéllar-Franca, & Azapagic, 2019), and it can improve community resilience by providing skills and localised employment to keep possessions in good working order and in use for longer (Morgan & Mitchell, 2015; Rossetti di Valdalbero & Birnbaum, 2017; Wijkman & Skånberg, 2015). It encourages a slower repair and share culture over the fast turn over, buy and discard one we currently have. The circular economy can encourage to us see objects we own as having the potential to outlive us and to develop and relearn skills our grandparents had in order to become stewards of our possessions (Robins, 2019). This is where the developing and nurturing of communities is important. By making people aware of their responsibilities towards consumerism we can build resilience to resource shortages and other future shocks.

Designers have a crucial role to play at every stage of the circular economy from the products we use to the systems those products enter into and applying our skills to make the transition to the circular economy smoother (De Los Rios et al., 2017; Lofthouse & Prendeville, 2018; Sumter, de Koning, Bakker, & Balkenende, 2019). The current focus on the circular economy is on the mechanical implementation, this risks the value of human life to the circular economy being pushed aside. Walter Stahel (2010), one of the early pioneers of circular thinking, places a lot of value on human energy as a crucial part of the circular economy. Humans are the ones to repair and maintain the products and systems, as well as develop technologies that make it easier to close the loop.

The next section will detail an early stage research project undertaken by the authors that aims to explore the role of community in circular economy organisations.

5. Research

The research being undertaken by the authors aims to take a deep look at the networks and communities used by a small number of organisations working in the circular economy. The research takes a mixed methods case study approach, using interviews, document analysis,

and social network analysis to create a comprehensive map of the communities and organisations the subjects are involved with. This will create a detailed picture of how these communities are used by circular economy focused organisations. The authors aim to map the networks of circular economy organisations based in North West England in order to make them "*visible and tangible*" (Manzini, 2015, p. 121), to reveal how these organisations are just a small part of the larger circular economy system. By focusing on a small number of organisations the research has time to look deeply into these connections, revealing any points of interest and creating new pathways of enquiry. The organisations looked at range from large multinationals to small start-ups, this is to give an idea of the challenges faced at different levels and to show how different sized organisations activate their communities and networks to engage with the circular economy.

By examining networked communities as part of the circular economy the research aims to reveal the intrinsic value of these nodal communities to the adoption and implementation of a circular economy. By exposing the way that communities are linked the authors hope to make these links more tangible and promote the use of these links within organisations and different types of community.

The analysis is ongoing and here we can offer a tentative look at one example of the results. Figure 3 shows a map created by one of the interview subjects of the connections their

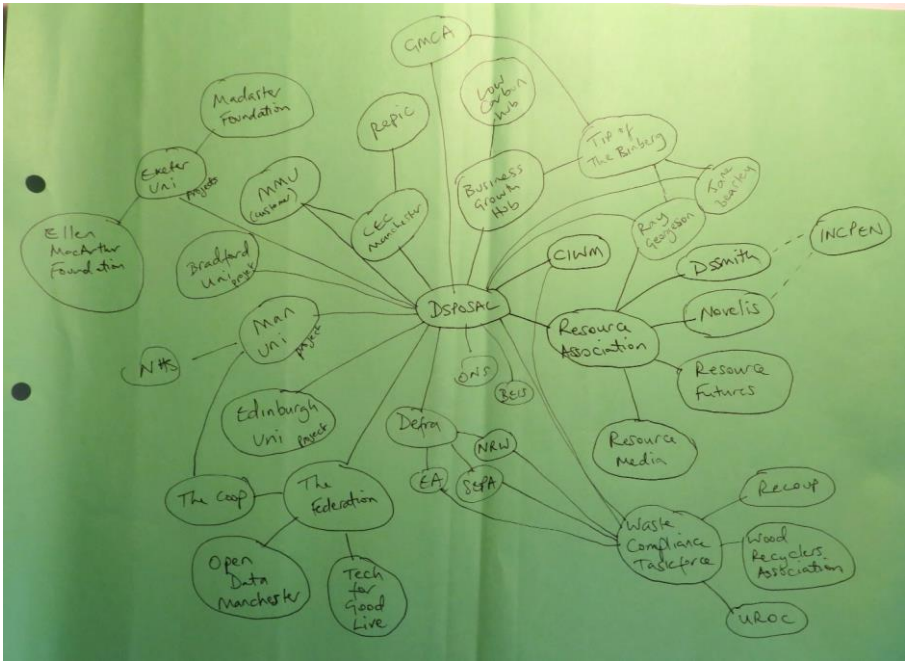

Figure 3: Rough map of interview subject's circular economy connections

business is involved with. For the analysis this map has been built upon with interview data and document analysis to create a fuller picture of the communities that the organisations are connected to (Figure 4). In this case study example, the map reveals many meso, or community level connections (purple links). These connections are made through a strong

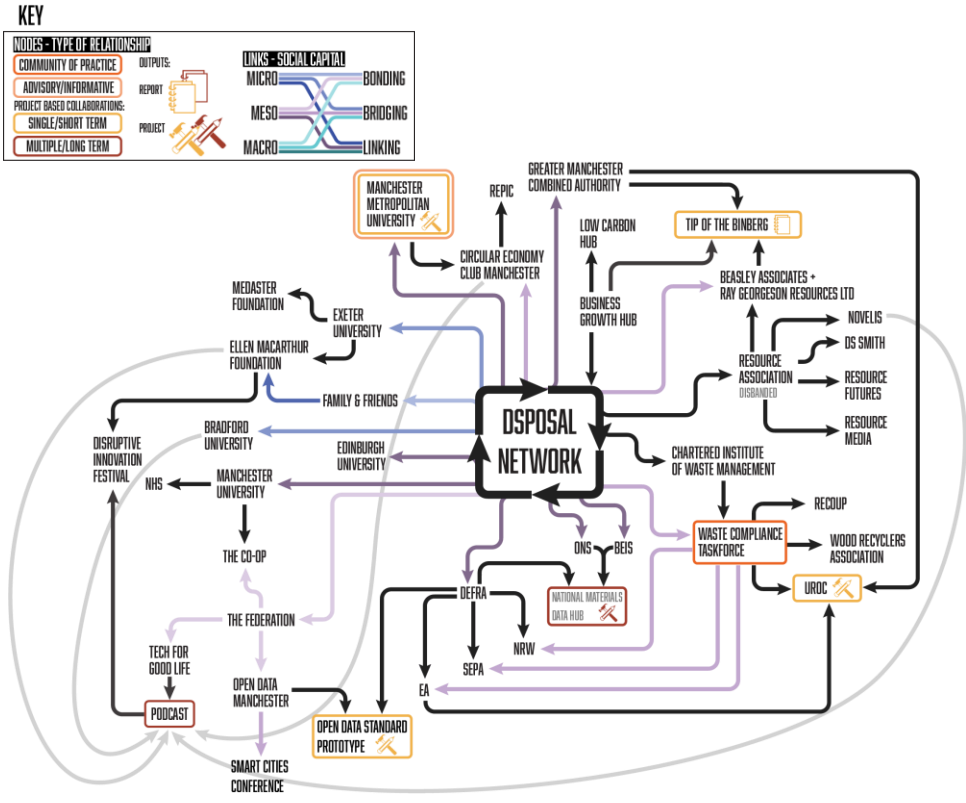

Figure 4: Social network analysis map of a case study organisation's network

push by the organisation to get their name out and create links with different people and organisations. The blue links indicate a personal or micro-level connection which is also prominent in the map, these links are used to create connections to new audiences and are actively pursued by the case study organisation. There is only one Community of Practice listed (in orange), but it provides opportunities for the organisation to link with areas of government that they wouldn't have otherwise had access to. This organisation, along with all the other case study organisations put a lot of emphasis on education and knowledge sharing through their networks. This can be aimed at other sectors, their industry peers, or through engaging the public with their organisation and using education as outreach.

Though each or the organisations studied in the research are based in different areas and are of different sizes, collaboration and engagement with wider audiences is highly important to each of them. Through providing engagement through their specific area they can open up the conversation to include wider concepts of circular economy with niche communities. The ongoing research hopes to create a body of evidence that demonstrates the need to put greater emphasis on building and establishing communities to further the circular economy agenda. This aims to ensure community becomes a more important focus and is included in the design of circular systems at every stage. These are the initial discussion points that have been raised from the data, further analysis is to be conducted before any concrete conclusions can be drawn.

6. Conclusion

Community is a structure that is deliberately designed, although, not necessarily by the current members. To ensure the continuation of the community members must take it upon themselves to reinforce the signs and symbols and boundaries of that community. Community can be viewed as a web of links and connections that we as designers should work towards revealing in order to strengthen these ties and create new ones. By making the web of an individual organisation's community connections tangible and visible, we can show just how actions, decisions and activities have the potential to ripple through the network. The circular economy as a whole is a complex web of networks that serve to loop resources around the system. The skills and knowledge locked within different communities need to be drawn upon to ensure success of circular economy implementation and uptake. The role of design within the circular economy is to establish bridges through the communities, explicitly exposing the links and realising the connections. Nothing happens in isolation so designers should be exposing these links and using them to create a truly circular economy.

Designing resilience. Design dealing with communities

Carlo Branzaglia[a],

[a]Postgraduate School, IED Milano. Scientific Coordinator
*c.branzaglia@ied.it

Abstract | Design - intended as a simplification toolkit for problem setting (therefore problem solving) - offers a methodology for resilience within communities in crisis (natural, economic, social). Communities which are involved in participated design dynamics: from Modena surrounding areas hit by earthquake (2012), to redesigned industrial areas such as airport cities (Bologna, 2013-2015), moreover from collective ecosystems (Distretto Popolare Evoluto, 2017), to public health interventions for entire neighbourhood (Gorla, Milan, 2019).

KEYWORDS | ONE, TWO, THREE, FOUR, FIVE

1. Design

Please read the entire guide before submitting the full paper as it will save time for you and make the review process easier for us.

The use of the word design has widened. If in origin, it was heavily based on its function of generating products, the focus today is on services, on social structures, on community dynamics. Design is an enabling tool (rather than a discipline), in the sense of the famous phrase "Good design enables, bad design disables" by Paul Hogan. It is a flexible methodology (Moura Guedes, 2008) that can be used in any context, because suspended between opposites. In fact, design is both strategic (acts on long-term policies) and tactical (it must adapt to the occasions). It is theoretical and practical (you have to think before you design, but there is no design without a final artifact, product or service); abstract and contextual; systemic and creative.

Design builds up relationships, more than creating objects or services. Even when working on physical products, the real goal is to build a behavioral system that connects artefacts to the physical and cultural dimension of mankind. So it works on material culture, renewing behaviors rather than technical solutions, with an extensive anthropological approach. Design research is in fact an analysis of behaviors, an expression of needs, an invention of solutions to be addressed to users. This fact is particularly relevant in participatory design operations, to share the typical approach worldwide celebrated as design thinking: to propose an innovative and transversal logic in the solution of problems, summarized by the question: “what if?” (Brown, 2009).

2. Communities

This approach assumes relevance when design is facing problems related to the modification of the cultural and behavioral structure of our society, characterized by a constant and rapid change. First of all, it’s crucial in terms of responsibility - the social responsibility of the designer - as far as he works on people's real needs (Steiner, 1978). But above all it implicates the possibility of generating new models of relationship, consumption, economy. Today working for communities is for designers today an occupation that no longer concerns only the possibility of innovating local production - that is a very useful and consolidated activity; but that of reinterpreting the logic through which the same dominant economy imposed by the western world is facing the global crisis of an entire model of production and consumption (that means: development).

The economic and social model revisions in its applications (food, mobility, energy ...) are the subject of holistic design approaches (Thackara, 2017), which move easily among ideas related to bioregions (Sale, 1985), cities in transition (Hopkins, 2009), de-growth (Latouche, 2011). On a deeper, avowedly anthropological level, the "Palaeolithic turn" (Meschiari, Corrado, Gori, 2015) launches the hypothesis of a “hunture” opposed to a culture: to signify

the relevance of a human model of hunter and gatherer. This model was prominent before the invention of agriculture, and underlines the prevalence of transitory, nomadic, portable forms, showing a strong similarity with absolutely contemporary features. For example, the triumph of design versus architecture, the authors say. We can also add that it works in community management: as in transitional communities (Bauman, 2001), in "local mind" (La Cecla, 1995), in TAZ Temporary Autonomous Zone (Bey, 2007).

3. Resilience

Therefore, designing community resilience, from a design oriented point of view, means taking into account a state of crisis that can be felt as temporary in the event of a disaster; but in reality managing conditions of perpetual uncertainty, in the collapse of an economic and cultural model, still so deeply rooted as to appear without any alternative; since the alternatives could be multiple, partial and combinable. In this scenario, design can favor and optimize that invention of the day by day life (De Certeau, 2001) which in reality represents the true behavior, spontaneous and irreverent, towards hegemonies, operated by "people". Designers, taking advantage of users' skills, and interpreting his role as a facilitator, in a context in which everyone, nevertheless, designs: their daily life, their holidays, their shopping list (Manzini, 2015). The term "facilitator" is not accidental. On one hand it designates an activity practiced by graphic designer (and also, useful for design procedures) as visual facilitation, which takes indirectly the mental maps created by the psychologist Tony Buzan (Buzan, 1996). On the other hand, it refers precisely to psychology practices of a much longer tradition (Lewin, 1949) that indicates the possibility of managing and balancing individual dynamics in a group mind. These activities can become fundamental in team building operations, when dealing with temporary communities built on participants with different backgrounds, who must however be quickly put in a position to collaborate (Branzaglia, 2016).

The possibility of working on metaphors draws very close to the tools related to design for communities, and indirectly, to the more conscious coaching practices. A design oriented approach has the ease of constructing situations through tools and techniques, which make the working methodologies easily practicable. The role of experience is also part of this kind of "design anthropology": because designers build up experiences, and because any project is based on common experiences. Therefore, it is not difficult to think of a figure of "community designer". It resembles the idea of "municipal graphic designer" jokingly hypothesized by Massimo Dolcini in the 80s, inspired by the figure of the municipal doctor. And it fits with the brand new role of "territorial activator", that is the one who gives birth to community networks on Commons - the common goods. Also the architecture field has many experiences of participatory approaches, related precisely to the issues of resilience: the cases of Shigeru Bahn or Alejandro Aravena.

4. Practice(s)

By the way, Design for Communities is the name of a project created for a technical case of resilience: the 2012 earthquake, in the province of Modena, Northern Italy. The project was carried out by ADI, the Italian Industrial Design Association, through its Emilia Romagna Delegation. ADI is a unique association, as it gathers not only designers but also companies, distributors, journalists, professors…: the complete system that makes Italian design so particular. ADI has been particularly interested in the latest years in investigating the role of design among SMEs, that are the economic engine of European industry, and maintain a strong relationship between economy and society because of their local involvement.

The damage caused by the earthquake on housing and production activities risked the disruption of the community network, especially for teenagers, those most sensitive to change. The school became the center of the project, together with a series of sub-themes enucleated in participatory workshops with public organizations and citizen associations gathered around the Town Council of San Possidonio (a very small town) and the Parents and Teachers Association (spontaneous) of the primary school in the town of San Felice sul Panaro. Four university-level educational institutions in the design sector of the region (Academy of Fine Arts Bologna, Faculty of Architecture University of Ferrara, Faculty of Architecture University of Bologna, ISIA Faenza), plus one from Rome (IED Istituto Europeo di Design Roma) and two high schools (BUS Pascal of Reggio Emilia and Venturi Art Institute of Modena) were invited to organize concept design processes developing the issue coming out the participated activities through practical solutions, but above all throughout possible scenarios and symbolic gestures that could easily engage the communities.

In this case, the immediate need to carry out a resilient project arose from the difficulty of the situation and from the awareness of the actors. The problem setting phase did not require special techniques to develop citizens' collaboration. In other cases, it was absolutely necessary to use pragmatic activities and contextual metaphors to build a work group - a temporary community - and push it to cooperate. The three projects developed under the Calderara Creative Community brand (C3) from 2011 to 2015 (under the auspices of DMC Design Management Center) needed to establish communities capable of supporting the production of guidelines for public administration, and of actively collaborating with it.

That meant activating citizens on participation through the role of the various social and cultural associations that were operating on the territory; and creating a high level of consciousness about participative policies among the town council employees and managers, first and before all the ones involved in direct relationship with citizens. On the basis of this process it was possible to design a series of strategic guidelines to identify objectives that have been transformed from time to time into actual projects, financed by various national and EU calls.

The case of Bargellino - a huge industrial area on the outskirts of Bologna, very close to the airport (half of which on the territory of the Calderara Town Council) - was particularly

significant. Economic crisis and previous abandon had turned the area into a problematic place. The involvement of managers and companies' owners in a workshop that could imagine the future of Bargellino led to an effective collaboration plan with the Town Council through the creation of an association between companies intended to protect and develop the area. That plan won an UE call devoted to masterplan for Smart Cities: the only one that was won by an industrial area. A series of structural interventions were made thanks to other national and European Call.

The role of sport as a healthy and commune activity was crucial for the C3 project, as it was for the No Filter social district, a former factory regenerated by the association Planimetrie Culturali in Bologna. Planimetrie Culturali became the main partner of DMC (together with Studio Performa architecture and Antigone network for democracy) for the development of Advanced Social District, a platform for planning management, governance and regeneration in abandoned places to create a "horizontal economy" (even more than a circular one): in essence a place to exchange resources and not money, to help people and groups in difficulty. The basic idea was that regeneration is more than redevelopment on urban scale: it concerns urban planning, social communities, educational programs, services for people and so on. The platform became the occasion for several speeches, conferences, lessons in many locations: but the absence of a policy by the local government of Bologna (even if promised) did not allow it to be practically adopted.

The last case concerned totally the role of communities in health promotion. The Agency for Health Promotion of Milan metropolitan area asked in terms of concept design to the in Graphic Design Master Program of IED Istituto Europeo Design Milano to develop a communication strategy regarding heath for healthy people. The goal was to engage people to take care of their heart before getting sick, in a neighbourhood (used like a test area) of 150.000 inhabitants, called Gorla. Urban Health (the name of the project) started from an investigation of the area, the involvement of associations and public services, the identification of functions and places to activate them. Social media were used to promote a series of opportunities and to suggest people in interacting with their environment, using it like a sort of spontaneous "open air gym". 3M Design Center cooperated with the project supplying materials to indicate or to enlighten common objects such as tools for sport activities. Although it was developed as a concept, the Agency purchased one of the final projects, in order to use it in a larger scale thanks to the collaboration with a national popular sport association.

If design is a matter of providing solution through an innovative approach, that can change the point of view on a specific problem, these cases are nothing more than examples of a design methodology (let's call it design thinking). They can demonstrate that the role of design is vital for transforming ideas in practical actions and for making strategy dialogues with tactic. Of course, both side of this last couple has to be aware of their role. And, in particular, who handles strategy can't think that resilience is the unique solution for solving problems permanently.

Abstract | Design has produced a world in which designers are presented with opportunities to alter, augment, intervene, and change existing conditions by imagining future possibilities. Many of the challenges facing the world today extend into a range of complex, societal issues that involve human actions within the natural world, resulting in a call towards sustainability. The role of design has undergone a shift from integrating systematic methods in the production of artifacts and information towards a focus on designing for more meaningful interactions. Design now requires new ways of thinking and doing through modifications, iterations and reflections to explore alternative models for education and practice. This leads to the development of new innovations and inclusive perspectives, forming social ecosystems to continually learn and evolve as a discipline for positive social change.

This research positions design as a force of change with a particular focus on sustainable fashion practices in Singapore. Design is capable of reconditioning existing knowledge against ecological concerns for methods of conservation and sustainability. It is foreseen that designing and capturing a map of Singapore's slow fashion movements will provide models and frameworks for other practices that are centred on issues of social innovation, social enterprise design, and social economies. This project presents the need to define the social ecosystem of Singapore's sustainable fashion, formalising existing industry practices towards a new paradigm for Asian design.

KEYWORDS | SLOW FASHION, SUSTAINABILITY, CULTURAL PRODUCTION, SUSTAINABLE FASHION, FASHION SYSTEM

1. Introduction

Fashion transcends time and space to communicate both individual and collective practices of the everyday within a complex system of designers, producers, distributors, marketers, and consumers. The fashion industry has shifted towards designing meaningfully, signifying a need to understand how sustainable practices can challenge and change future ways of thinking, making, organising, categorising, and sharing knowledge. This research outlines how fashion establishes a common, shared language through an examination of design initiatives and businesses to identify key perspectives, concepts, and theories supporting the symbolic communication of material culture. Taking the context of Singapore and its emerging sustainable design practices, this research examines current practices to provide a foundation upon which future models and frameworks can be developed.

The main discussion of this paper collects, organises, and evaluates the existing sustainable fashion movements of Singapore. These businesses, organisations, and design groups are categorised by scale, scope, and impact: *sustainable modes of production, second-life initiatives through reuse and recycling, circular and sharing economies, inclusive models, and education.* This paper presents three key sections to present a comprehensive overview of the fashion landscape of Singapore:

1. An introduction of theoretical perspectives to frame the discussion of how fashion, as a social practice, leads to cultural production through the adoption of sustainable movements.
2. A presentation of the sustainable landscape of fashion through an examination of current practices in Singapore, identifying five core themes of sustainable fashion.
3. A mapping of slow fashion and its future implications.

2. Theoretical Perspectives

Sustainability extends beyond conscious activities relating to the environment to involve the complexities of human relationships against the dynamics of ecological, economical, sociopolitical, global and local dimensions (Annamma et al., 2015). Fashion businesses are becoming increasingly concerned with producing value through new definitions of aesthetics and quality, as sustainable practices begin to establish new norms within the industry. This section provides an overview of how fashion acts as a social phenomenon to develop common values for the production and contribution to various expressions of culture. The review of these theoretical perspectives will lead to a discussion of how the fashion industry is shifting towards the widespread adoption of sustainability.

2.1 Fashion as a Social Practice and Means for Cultural Production

Fashion produces a world in which the dressed body presents a situated practice across varying degrees of social interaction (Entwistle, 2000). Individual identity is visually represented through bodily expressions to actively produce experiences, communicate shared values, and develop socially constructed practices. Influenced by social and experiential dimensions, the dressed body creates embodied spaces upon which durability and resilience are established through emotional values and meanings (Fletcher, 2012). Changes in style and aesthetics require active participation to form collective representations and preferences, defining the social nature of fashion.

The phenomenon of fashion contributes to new and significant symbolic values to impact consumption through cultural dissemination and material culture, resulting in cultural production (Crane & Bovone, 2006). As a social practice, the collective adoption of fashion produces new cultural currencies as an extension of cultural practices and values. Rocamora (2002) argues that the fashion system has become fragmented as a result of globalisation, which has led to an increase of stakeholders to reevaluate the temporality of fashion objects, proposing new patterns of production and consumption. Fashion is in need of a new vision that challenges the historical notion that fashion is driven exclusively by newness and change (Reily and De Long, 2011).

2.2 Fashion Sustainability

Sustainability is a concept that requires a different approach to former ways of doing, presenting a new standard based on values that include basic human rights such as justice, liberty and dignity (Ehrenfeld, 1999). There are a few other critical influences that affect business models, from the translation of sustainability principles to the form of the value proposition. Taking into consideration the different strategies required, from start of the supply chain to the end, there are a few reasons for fashion businesses to look towards adopting a sustainability agenda.

In a period where information is readily available and easily accessible, all stakeholders have greater access to education and global exposure. People, whether consumers or business owners, are more aware of the impact of their decisions and the consequences of their actions set against external levels of change. This allows them the capabilities to act more intentionally, strategically and creatively in response to the things around, whether it be a focus on community or the environment. In this sense, such consumer mentality reaps relevant business benefits to adopt environmentally friendly materials, ethical production processes, and other socially conscious decisions.

The adoption of sustainability also requires resources for education. The benefit of championing a sustainable agenda draws like-minded consumers and businesses together to form a coalition of influence to leverage degrees of power and foster collaborations and engagements between members. Often, the main causes and underlying philosophies expand beyond the nature of the business and its immediate industry, leading to potential opportunities to broaden the playing field. As people resonate with values and beliefs that are close to them, consumer education focusing on the potential benefits behind a sustainable agenda can be a first step towards changing existing practices and norms.

Due to the production of excess and wastage in the industry, another opportunity that aims to curb the situation is the development of service based business models that reduce stock or operate without a need for production. This shifts the idea of consuming fashion through means that move away from acquiring new fashion products, introducing ways to reinvent or restyle existing products (Todeschini at el., 2017). These services comprise consulting, after sale services to help consumers maintain and recycle goods, and garment subscription schemes. This section has outlined examples, of which there are many others, that pose opportunities to incentivise fashion towards the adoption of a sustainability agenda.

3. Theoretical Perspectives

The fashion landscape of Singapore was examined and categorised based on modes of production, rhythms of consumption and use, forming communities of practice, establishing consciousness and social awareness through design, and contributions to education. The categories of sustainable fashion have been further organised into the five areas of production, second-life initiatives, circular and sharing economy, inclusive models, and education.

Production

Despite a growing number of fashion brands and businesses adopting buzzwords such as “sustainable” or “responsible” as a means for differentiation and a form of marketing, there is a broadly accepted and understood definition that sustainable production involves ethically and ecologically-sourced materials, fair wages for workers within favourable conditions, transparent information and environmentally conscious approaches.

Second-Life Initiatives

These initiatives provide closed-loop systems adopting ecological practices by encouraging consumer participation and engagement, reducing fashion and textile waste. As users are given access to more products, regardless of time and geographical constraints, these initiatives tackle socioeconomic and cultural barriers.

Circular and Sharing Economy

As a direct response to the current internet culture of showing and discarding, these businesses address issues of compulsive purchase behaviours, patterns of excess, and waste by offering platforms for sharing, swapping, and renting. The platforms provide a sense of community between merchants and groups of consumers, developing new cultures of consumption and product use.

Inclusive Models

The term "inclusivity" has been widely adopted by the fashion industry, where business models provide opportunities and financial resources for communities in need through charities, social enterprises, collaborations through co-designing, and initiatives supporting sociocultural needs.

Education

Knowledge plays a key role in sharing and communicating the stories, narratives, traditions, and consumer responsibilities in fashion. The educational models of fashion businesses teach consumers the importance of sustainability through events and panel discussions to set new policies governing conscious practices in fashion.

Table 1. Classification of Slow Fashion in Singapore

CLASSIFICATION OF SLOW FASHION		
AREA OF FOCUS	**ORGANISATION**	**ACTIVITIES**
PRODUCTION	August Society	*Produces seasonless and reversible swimwear made by fair wage workers in Indonesia using recycled materials*
	Esse	*Garments are ethically sourced using environmentally-friendly materials such as Tencel and organic cotton. The production processes are shared openly on their website.*
	Matter Prints	*The brand works with artisans from across the world to develop unique prints for garments, giving credit to artisans by conveying the stories and cultural significance of the prints to consumers.*
	Source Collections	*The brand uses sustainable fabrics, such as Tencel and Lyocel, and produces garments in factories owned by certified WorldWide Responsible Accredited Production (WRAP) individuals.*
	Terie	*Focuses on the empowerment of women by producing bralettes for all sizes with eco-friendly bamboo material..*

	Terra by Qlothe	*The brand uses Tencel, among other sustainable materials, for their garments and works with the Indonesian Prime Minister on the "Buy a Piece, Plant a Tree" program to help restore degraded peatlands and create a sustainable livelihood for native communities. They work with Noissue as part of their eco-packaging alliance, contributing to global reforestation.*
SECOND-LIFE INITIATIVE	Carousell	*Carousell is a user-based platform where transactions can be made to sell preloved items.*
	The Fifth Collection	*The Fifth Collection is a digital platform to sell/rent second-hand luxury products on a consignment basis.*
	The Kint Story	*An online store that sells preloved garments, primarily targeting teenagers and young adults. Its founders give talks in schools to educate the public about sustainability.*
	On the List	*A space dedicated to the clearance of past-season items from luxury brands through online and offline platforms.*
	New2U	*A thrift store where proceeds from sales go to helping victims of domestic abuse from the Singapore Council of Women's Organisation (SCWO). The store also hires women to train them for future employability.*
	PraiseHaven Thrift Store	*Helps underprivileged families and beneficiaries under The Salvation Army.*
	Refash	*Buys and sells second-hand fashion through online and physical channels.*
CIRCULAR & SHARING ECONOMY	Closet Share	*An online platform to rent occasionwear, bags and dailywear on a subscription basis.*
	Covetella	*A platform to rent gowns for formal occasions.*
	The Fashion Pulpit	*A thrift store concept that promotes sustainable fashion by screening documentaries and hosting swapping events/talks. Its founder, Raye Padit, is known for hosting talks on how to lead a more sustainable lifestyle.*
	Green & Gorgeous Fashion Swap	*An organisation that hosts events allowing consumers to swap their fashion items.*
	Long n Loose Singapore	*An organisation that organises clothes swapping events. They support modest fashion and makes swapping more accessible for Muslim women who want to be eco-concious.*
	MADThread	*A platform to rent gowns for formal occasions.*

	Rentadella	*A platform to rent gowns for formal occasions.*
	Style Lease / Ivory	*A platform to rent gowns for formal occasions.*
	Style Theory	*A platform that sells subscriptions to rent clothing and bags for daily wear and/or special functions. The brand holds warehouse sales to clear products that are worn out.*
	Swapaholic	*A platform that promotes clothes swapping among members. Members can swap their preloved clothes at swapping events.*
	Your Clothes Friend Swap	*For a small fee, participants are invited to swap their unwanted clothes that are in good condition for other items that are on offer.*
INCLUSIVE MODEL	Abry	*Hires elderly women and supports underprivileged women by helping them find employment through upskilling.*
	Artisan and Fox	*A sustainable, transparent brand that sells accessories made by artisans from impoverished communities. Artisans are guaranteed 50% of all gross profits from each item. Micro-loans are provided, as well as pay for raw materials in advance, and the company helps to open bank accounts when the need arises.*
	Baliza Shop	*A resort-wear brand that focuses on ethically made clothing. The products use unique methods such as block-printing, beading and embroidery, which are performed by women and children living in poverty. They are committed to developing new skills for their artisans and sourcing for sustainable materials.*
	Covenant Jewellery	*The products are made by silversmiths and jewellers in Phnom Penh, Cambodia. The gems are ethically sourced from a family-run factory in India working with conflict-free diamonds.*
	Eden + Elie	*The brand produces handmade jewellery with artisans with ethically-sourced materials.*
	Ma Te Sai	*Works with artisans in Laos to produce accessories, with proceeds helping the communities.*
	Will and Well	*Designs garments for persons with disabilities to allow them to be more independent and comfortable when taking part in daily activities.*

EDUCATION	Connected Threads Asia	*Brings together fashion designers, manufacturers, suppliers, and consumers to start conversations on how to transform the industry into one with a conscience. They aim to promote sustainable fashion in Asia.*
	Fashion Revolution	*Unites people and organisations to work together towards radically changing the way clothes are sourced, produced, and consumed in a safe, clean, and fair way. Encourages and creates a more ethical and sustainable future for the fashion industry.*
	The Good in Fashion	*TGIF is a student-led, non-profit campaign that aims to reduce textile waste by encouraging Singaporeans aged 21-29 to donate, resell, swap and buy second-hand clothes.*
	Green is the New Black	*An organisation committed to promoting sustainable ways of living through producing articles on fashion, travel and lifestyle, promoting their causes through collaborations and events.*
	Textiles and Fashion Federation (TaFF)	*The official association for the textile and fashion industry in Singapore, TaFF plays an active role in the development of the industry from retail to manufacturing. Working closely with the Singapore government, TaFF is working to position Singapore as an innovative fashion hub in SEA.*
	Zerrin	*An online platform that guides consumers on the latest sustainable design talent — from clothing and jewellery to skincare and accessories. A resource for the latest happenings in the emerging sustainable fashion and beauty industry.*

According to Henninger et al. (2016), the attributes of sustainable fashion should consider sourcing and production processes as well as transparency and traceability. Sourcing and production involve all activities from the use of eco-friendly raw materials to demonstrating a sensitivity towards the social aspects of fashion production, whereas transparency and traceability work towards building trust and relationships with consumers. Table 1. provides a classification of sustainable fashion initiatives in Singapore, in which the organisations are separated according to the 5 overarching principles of sustainable production, second-life initiatives, circular and sharing economy, inclusive models and education. The classification of existing fashion practices in Singapore signifies a growing interest in the region for change and progress towards slow fashion movements, where the underlying philosophy of sustainability is defined by ethical values, environmental and social sensitivity, and moving towards awareness and change.

4. Mapping of Sustainability

The previous section presented a table demonstrating that sustainability cannot be narrowly defined and should be expressed through more descriptive categories to align activities and clarify the objectives for more sustainable practices in fashion. Clark (2008) argues that slow fashion movements, which adopt the underlying principles of sustainable practice, involve different perspectives. Designers and businesses need to develop awareness of local resources and economies, creating economic value for the communities and societies with and within which they operate. Transparent production systems communicate clarity across the supply chain, providing a connection between producers and consumers. Sustainable products embed narratives and cultural heritage through processes of making, producing meaningfulness for end users.

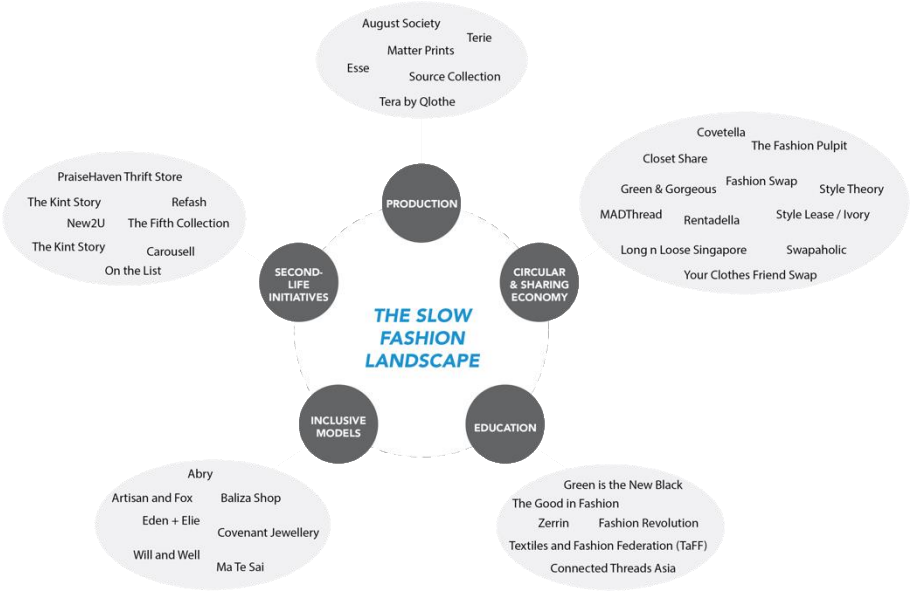

Figure 1. A Mapping of the Slow Fashion Landscape of Singapore

The shift towards slow fashion indicates a need to identify the broader scope of sustainability and question issues of governance and agency in the relationship between designers, producers and consumers. Slow culture focuses on small-scale production, traditions and culture rooted in craft techniques, an appreciation for local materials and markets, challenging the more widely adopted definition of fashion as relying on mass production and globalised style adoption (Fletcher, 2010).

Figure 1 visually articulates the various sustainable initiatives of fashion movements, platforms, organisations and communities in Singapore to present a mapping of the slow fashion landscape. The mapping shows the density of slow fashion initiatives adopting renting and swapping services as part of the circular and sharing economy, providing an alternative lifestyle for satisfying the cyclical nature of fashion that relies on the temporal rhythms of newness and change. In response to the market saturation within this space, it is foreseen that these business models will inform future practices that directly involve users through community-level interactions and communication. The mapping provides an holistic overview of how sustainable initiatives and philosophies are developing and functioning within the field of fashion, providing evidence of a growing slow movement through the cultural production of symbolic value.

5. Future Directions

This paper has presented an overview of the necessary shift for the fashion industry towards more sustainable practices. Through an examination of current and emerging slow fashion initiatives in Singapore, the landscape of sustainability begins to shape new models and frameworks through the evaluation of best practices. The mapping informs current categorisations of slow fashion while suggesting future research directions in the form of detailed case-study analysis and developing replicable frameworks for moving towards a more sustainable industry.

New rhythms of production emerge as designers and producers realign activities around the concept of care, developing new values throughout the supply chain for all involved stakeholders. This pushes for a radical change in the fashion industry and its larger system of operation, reevaluating and redefining the conditions of future models and processes of development. The philosophy of slow fashion begins with addressing stakeholders' needs and considers the larger impact of how various levels of sustainable activities inform new cultures of design, production and consumption.

Abstract | With the rapid growth in economies, consumption patterns and populations, sustainable access to water, energy and food resources is under increasing pressure. The Water-Energy-Food Nexus has been widely proposed and accepted as one approach to address the challenges. This paper combines the Sustainable Product-Service System (S.PSS) and Distributed Economies (DE) two promising and interwoven offer models coupling environmental and social with economic sustainability with the Water-Energy-Food (WEF) Nexus approach. Furthermore, develop twelve dimensions characterizing to explore the characteristics of designing S.PSS applied to DE in WEF Nexus approach with the analytical conceptual research approach. Finally, critical features and challenges are summarized during the process of analyzing the three cases from India, Africa and Singapore, that focus on different S.PSS solutions applied to DE in WEF nexus approach.

KEYWORDS | SUSTAINABLE PRODUCT-SERVICE SYSTEMS (S.PSS), DISTRIBUTED ECONOMIES (DE), WATER-ENERGY-FOOD (WEF) NEXUS, DESIGN FOR SUSTAINABILITY, RESILIENCE

1. Introduction

In the transition towards to a sustainable society for all (Sanneh,2018; Lambert et al., 2020), the resource challenges of water, energy and food in turning society to a more sustainable direction are tremendous and urgent (Chang et al. 2016). Many people around the world do not have enough water, energy and food: 2.2 billion people do not have safely managed drinking water services (WHO&UNICEF, 2019); 770 million people without electricity access and over 2.6 billion people still do not have access to clean cooking (IEA, 2020); and 2 billion people experienced hunger or did not have regular access to nutritious and sufficient food in 2019(FAO, 2020). With the global population expected to grow to 9.7 billion by 2050 (United Nations, 2019), accompanied by increased in incomes, industrialization, economic change, and globalization will result in the global demand for water, energy, and food growing beyond the carrying capacity of the earth (de Andrade Guerra et al. 2020; Abulibdeh & Zaidan, 2020). Meanwhile, the three elements of water, energy and food are interdependent and closely related. Water is needed to produce energy, energy is needed to extract, distribute and treat water, also food production requires both water and energy. The global demand for energy and food is estimated to increase by 50% and 60% respectively (EIA, 2020; FAO, 2020), also that time around 52% of the world's population living in water-stressed regions (Kölbe et al., 2018). Growing scarcity can worsen access to basic needs and threaten the integrity of ecosystems, the integrated resources management, or better still a system design approach to water, energy and food supply, have the potential to address and halt these trends. It has been highlighted in decision-making process due to the complexity of relationships among these three elements (Bazilian et al., 2011; Howells et al., 2013), i.e., to adopt a system approach to the nexus design, development and management. The approach to provide integrative interconnections with which to encompasses some of the most critical problems compromising the livelihoods of current and, even more so, future generation, have been referred to as the Water-Energy-Food (WEF) Nexus (Bazilian et al., 2011; Keairns et al., 2016; Kurian, 2017; Leck, et al., 2015; Weitz et al., 2017; Namany et al., 2019). The Water-Energy-Food (WEF) Nexus has become central to discussions regarding the development and subsequent monitoring of the SDGs, which across Goal 6 (clean water for all), Goal 7(energy for all) and Goal 2(food security for all). A well-coordinated nexus system approach could be the first step in realizing these goals (Obersteiner et al. 2016; Mercure, et al. 2019; Simpson et al. 2019).

In recent years, WEF nexus have been developing rapidly in academic and scientific research as a novel approach to understand complex interactions among multiple resource systems (Mabrey et al., 2018; Liu et al., 2017; Endo et al., 2017; Albrecht et al., 2018). However, specific models, frameworks and approaches to addressing WEF nexus issues applying the systematic analytical thinking remain limited to date. Under the study within the LeNSin project-the International Learning Network of networks on Sustainability (EU Erasmus +, 2015-2019), two promising and interwoven offer models coupling environmental and social with economic sustainability have been proposed, practiced and validated by a large number

of case studies and design experience applied in different contexts around the world (especially the low/middle-income contexts); these models are the Sustainable Product-Service System (S.PSS) and the Distributed Economies (DE), that have been referred to a win-win sustainable opportunity for all (Vezzoli et al., 2014, 2017; Kohtala, 2015; Emili et al., 2016; Petrulaityte et al., 2017).

This paper aims at filling the knowledge gap regarding the combination of these three models. More specifically, the goal is to define, characterize and give the first outcomes of the research hypothesis of a key role in designing S.PSS applied to DE focused on WEF Nexus. In particular, the research questions tackled in this paper are:

- What are the characteristics and models of S.PSS applied to DE in WEF Nexus approach, especially in low and middle-income contexts?
- What are the applications of these models to promote sustainability for all?
- What are the critical factors and challenges to characterize the S.PSS applied to DE in WEF Nexus approach?

2. Methodology

1. Literature review. Drawing from literature review on the definition, characteristics, and sustainability analysis of S.PSS, DE, SPSS applied to DE and WEF Nexus from previous scientific research works and LeNSin project activities, to establish the internal relationship among them.

2. Theory-building. The identification of designing S.PSS applied to DE in WEF Nexus approach characterizing was carried out using the analytical conceptual research approach (Meredith, 1993; Wacker, 1998). This approach focuses on building new insights through logically developing relationships between defined concepts, in this case the S.PSS, DE, SPSS applied to DE and WEF Nexus concepts and dimensions analysis.

3. Case study analysis. According to the identification of dimensions characterizing designing S.PSS applied to DE in WEF Nexus approach to select and analyse cases through descriptive analysis, that have been published by respectful nongovernmental organizations such as UN, and FAO. In order to gain an understanding of characteristics of existing models, and to confirm and extend S.PSS applied to DE in WEF Nexus approach dimensions and variables.

4. Reflection. Retrospective analysis of the study and specified the main research findings, as well as critical factors, challenges, limits and recommendation for further researches.

3. Sustainability Potential Models

3.1 Sustainable Product-Service System & Distributed Economies

The concept of Sustainable Product-Service System (S.PSS) has been studied since the end of the 90th as one of the most promising models for innovation based on the shift from traditional product or service sales to a combination of products and services to address specific customer demand (Goedkoop et al., 1999; Cooper and Evans, 2000; Mont, 2001; UNEP, 2002; Tukker and Tischner, 2006; Baines et al., 2007). When PSS re-orient unsustainable production and consumption patterns, and reduces the environmental impact of the "satisfaction unit", it is referred as Eco-Efficient Product-Service System (Manzini & Vezzoli, 2003); in the case sustainable benefits are also related to the socio-ethical dimension, it is referred to Sustainable Product-Service System (Vezzoli et al., 2015). Among other definitions, S.PSS refers to "offer model providing an integrated mix of products and services that are together able to fulfil a particular customer demand (to deliver a "unit of satisfaction"), based on innovative interactions between the stakeholders of the value production system (satisfaction system), where the ownership of the product/s and/or the life cycle services costs/responsibilities remain by the provider/s, so that the same provider/s, for economic interest, continuously seeks environmentally and socio-ethically beneficial new solutions" (Vezzoli et al., 2018).

Distributed Economies (DE) is a concept that has been developed as a response to the current industrial production systems that promotes the development of small-scale, decentralized, flexible units that are synergistically connected with each other and make use of local resources (Johansson, et al, 2005). Also, DE strives for innovative regional sustainable development strategies. In this context, "regions" are defined (IIIEE, 2009) as small network entities integrated into the network, providing the advantage of being more flexible and resilient to change. Within the LeNSin project, DE has been referred as a paradigm shift from centralized large production unit and distribution system to small scale locally-based production units empowering end-user control on essential activities and eventually peer-to-peer network-structured to optimise production and consumption by sharing resources and/or goods and/or information/knowledge. The definition has been so far reorganised as follow (LeNSin, 2019):

> "Distributed Economies are small-scale production units, shifting the control on essential activities towards or by the end-user, whether individuals, entrepreneurs or organisations, i.e., there are no intermediaries, or the producers are the same end-users. The production unit could be standalone or network-structured with other DE units to share various forms of products, semi-finished products, resources and/or services, i.e., they become a Distributed Economy Network (DEN), which may in turn be connected with similar networks.
>
> If properly designed they are promising to promote locally-based sustainability, i.e., Sustainable Distributed Economies (S.DE)."

The S.PSS and the DE models, or better still their combination, have been considered as promising methods to simultaneously tackle economic, environmental and socio-ethical issues in low/middle-income (all) contexts (Vezzoli, Kohtala, Srinivasan, 2014). The S.PSS applied to DE i.e. the design of Systems of Products and Services applied to Distributed Economy artefacts. That can reduces/cuts both the initial (capital) cost of DE hardware purchasing (that may be unaffordable) and the running cost for maintenance, repair, upgrade, etc. of such a DE hardware (that may cause the interruption of use), while increasing local employment and related skills, as well as fostering for economic interest of the producer/provider to design low environmentally impacting DE production unit and products, resulting in a key leverage for a sustainable development process aiming at democratizing the access to resources, goods and services (LeNSin proposal, 2015-2019) (Figure 1).

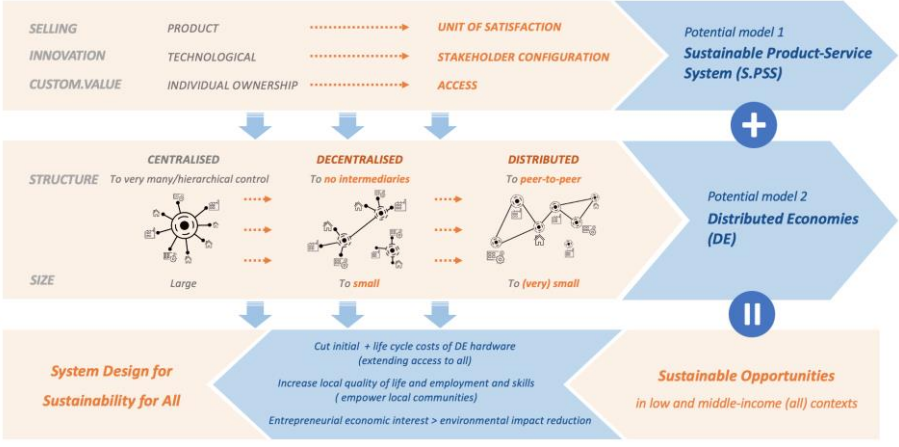

Figure 1. The analysis of sustainability potential of S.PSS&DE models.

3.2 The WEF Nexus

The Water–Energy–Food (WEF) nexus constitutes a framework for analyzing the dynamic interactions between water, energy and food resources flows and stakeholder interaction with systems approach and developing very effective strategies for sustainable development, increasingly recognized by international organizations, academics, policy analysts and other stakeholders (Liu et al., 2017; Endo et al., 2017). The germination of WEF Nexus concept can be traced back to the 1970s in the book of “the growth extremely limited", which is a preliminary exploration of supply, demand, and security issues between population, economy, and WEF (Meadows et al., 1972). Then the academics and related organizations in United States, Japan, India and other countries, successively carried out the studies of food-energy, and food-water (Levison et al., 1977; Allan, 2003; Qadir et al., 2007).

However, the WEF nexus framework first being proposed was in the World Economic Forum (2011), which frames the WEF nexus as a major global risk for economic and social development while the framework developed by Hoff (2011) for the Nexus conference in Bonn is centred around the availability of water resources – taking into account global trends and potential fields of action. The eco-system-based framework from International Institute for Sustainable Development (2013) followed, which considers the access and availability dimensions of water, energy and food and embeds the WEF nexus in the natural, built, institutional and governance systems. The FAO framework concentrated on the links between the human and natural systems for fostering sustainable development based on a resource-focused published in 2014. The above research on WEF nexus framework mainly focuses on the whole process of nexus from concept to action in a macro perspective, including not only the core correlation of resource system but also the peripheral influencing factors and action path. Meanwhile, several other frameworks concerned the key issues in water, energy and food have been published, including the one from Stein(2014), which illustrated how the different water-energy-food nexus domains and associated actor networks are interconnected and Biggs et al. (2015), who proposed a framework that inclusively accounts for livelihoods within the water–energy–food nexus to enhance water, energy and food security at local livelihood level.

At present, despite the WEF Nexus still has not formed a definitive definition influenced by the multiple research scale and relatively short development period, the understanding of WEF nexus can be summarized as the combination of core system and peripheral system (Figure 2). The core WEF Nexus system illustrates the inside-relevance of the three elements water, energy and food, that reflects the interdependence and mutual restriction relationship between water, energy and food resources, for example, the storage, extraction, transportation, treatment and utilization of water resources require energy consumption; the food production requires water and energy consumption from irrigation to processing and distribution; while the production of food and energy requires a large amount of water, which may disrupt the transformation process of water resources and cause water resource pollution. The peripheral WEF Nexus system refers to the outside-relevance, presents the complex influence of the factors such as climate change, population growth, globalization, urbanization, technology, economy and etc. involved in environment systems, economy systems, and society systems on inside-relevance. It is worth emphasizing that it needs a more broadly inclusive understanding of the WEF Nexus, the essence of WEF Nexus is the nexus thinking, which refers to optimize WFE Nexus synergistic benefits considered both the core system and peripheral system to ensure the lower environment, economy and society impacts i.e. reliable resource security, affordable and equal access, Less waste, minimize losses, higher efficiency, stable development, sustainable adaptability and etc.

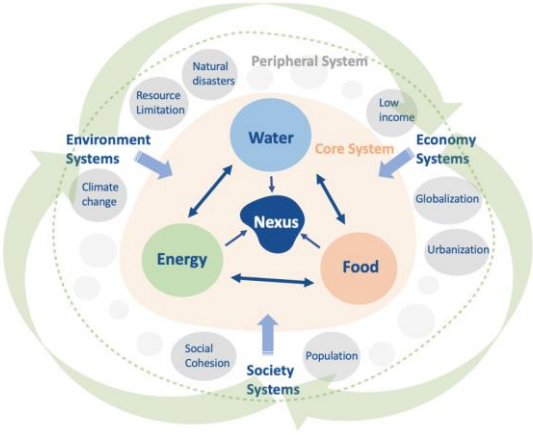

*Figure 2. The WEF nexus syste*m combination of core system and peripheral system.

4. Characteristics analysis

The characteristics analysis and research that integrates the contribution of S.PSS to DE with WEF Nexus could be studied through the definition of characterising dimensions of the three models. Dimensions refers to variations of properties that give specificity and range to certain concepts (Corbin & Strauss, 2014). The literature review of WEF nexus in 3.2 highlighted the need of a more broadly inclusive and systematical understanding of the WEF Nexus both the core system and peripheral system. As a fact, six dimensions are here (Figure *3*) be summarized and defined to characterise the WEF nexus through the system thinking.

The first dimension is the spatial scale, indicates the geographic level of applicability for the nexus. It is essential to clearly define the WEF issues in each scale like global, region, community, household (Garcia et al., 2016), as well as how they relate to and affect each other. Meanwhile, the quantity and quality of water, energy and food resources are influenced by time factors and fluctuate within different temporal scales of weeks, months, years, etc. A key dimension used for describing WEF nexus models is system breadth, i.e., the scope of the nexus and/or resources included. Due to the inextricable linkages among the WEF nexus system and their external resource and ecological environments, the nexus can evolve to embrace more resources or factors, like the livelihoods (Biggs et al., 2015), climate (Beck et al., 2013), land (Ringler et al., 2013) and so on. Another important dimension considered in the nexus is the stakeholder. It refers to the roles involved in the system related to supply chain, also the regulators and policymakers. The appropriate consideration and application of the objectives of each stakeholder in nexus system are classified as multiple objectives dimension. Different hierarchy of stakeholders (individual, enterprise, manufacturers, governments, etc.) have various sustainability priorities.

Industries and agricultural producers are primarily concerned with income and prices, households are concerned with financial security and health, and government are concerned with financial policy, environmental and social factors (Garcia, 2019). Finally, the events or activities that have a significant adverse impact on the WEF nexus system have been considered as the key indicators for assessing system risk and achieving sustainability (Abulibdeh et al., 2020), defined as risk assessment dimension.

WEF Nexus Dimension	Description	Details
Spatial scale	The geographic level of applicability for the nexus. Each scale has its own supply chain of the water, energy and food, also, each scale is connected to the other.	Global, region, community, household (Garcia et al., 2016); International, regional, national, urban areas, rural areas, and household scales (Abulibdeh et al., 2020); etc.
Temporal scale	The quantitative and qualitative of water, energy, and food resources fluctuate both hourly, and over scales of weeks, months, and years. Meanwhile with the increase or decrease of the spatial scale, the temporal scales can be affected by the activities of resource interaction and transfer.	Households purchase and consume water, energy, and food products, which can be on the order of hours to days, with exceptions for appliances. Regional or global suppliers must plan, design, and operate water, energy, and food supply chains, which can be fixed for years (Garcia et al., 2016).
System breadth	The scope of the nexus and resources included. Due to the inextricable linkages among the WEF nexus system and their external resource and ecological environments, the nexus can evolve to embrace more resources or factors.	Water, energy, food; Water, energy, land, food (Ringler et al., 2013); Water, energy, climate, food (Beck et al., 2013); Ecosystem, water, food, energy (Karabulut et al., 2016); etc.
Stakeholder	It refers to the roles involved in the system related to supply chain, also the regulators and policymakers.	Energy enterprise, food manufacturer, water supplier, biofuels company, agriculture producer, industry producer, etc.
Multiple objectives	It refers to the consideration and application appropriately of objectives of each stakeholder in the system.	Resource demand, consumption, profit, cost, product quality, social welfare, etc.
Risk assessment	It refers to the events or activities that have a significant adverse impact on the inside-relevance and outside-relevance of the WEF Nexus system.	Population growth, economic risk, extreme weather, conflicts, agriculture, technology, policy, etc.(Hoff, 2011; Lawford et al., 2013; Abulibdeh et al., 2020)

Figure 3. The description and details of dimensions characterizing WEF Nexus.

On the other hand, the S.PSS dimensions are identified as value proposition (payment structure), product ownership, product operation, provider/customer relationship (from product-oriented to result-oriented), sustainability potential (both economic interests and environmentally and socio-ethically benefits), and are slightly revised from the five dimensions of PSS models studied by Gaiardelli et al. (2014). The DE Dimensions through the practices and research works of LeNSin project can be described to eight, value proposition, system structure, resource type, capital financing (governmental subsidies, donations, private loans, micro-finance institution, etc.), system ownership, organizational form (public, NGO, community, PPP/hybrid, private), system operation and target customer.

In reference to the DE dimension of system structure and resource type, further clarification can be made. To better illustrate the complex system relationship related to multiple scales

and levels interactions from centralized, to decentralized and distributed, it has defined the four main sub-structures: stand-alone, network, network of networks, and centralized connected structures, totally 13 archetypal configurations to indicate the system structure dimension (Figure 4) (i.e. the distributed network structure, it refers to the private or household products/services with sharing or connecting the products/services to the local community/neighbour/etc.). Also, the type of resource involved in the services and/or products of the DE system, has been divided into hardware/resource-based (energy, food, water, manufacturing, etc.) and knowledge/information-based (software development, knowledge generation, design and etc)

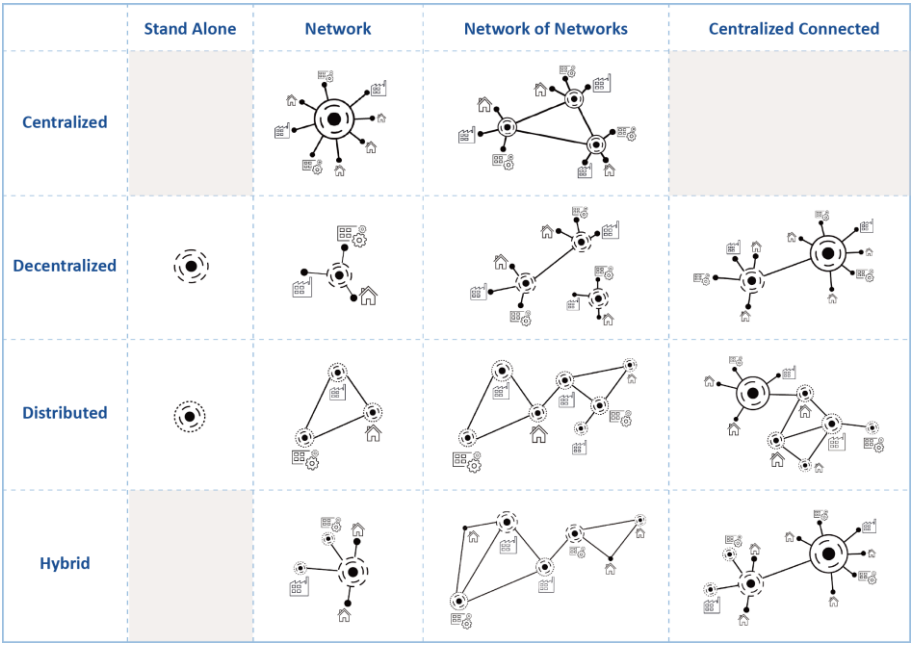

Figure 4. The 13 archetypal configurations to indicate the system structure dimension.

The combination of S.PSS and DE and WEF nexus dimensions led to the twelve dimensions characterizing in designing S.PSS applied to DE in WEF Nexus approach (Figure 5 and Figure 6). The Dimension 1 means what is the value proposition delivered in the system solutions, in general, it refers the target customer how to pay the solutions provider for water, energy, food production/service or other related service. Meanwhile it is essential to indicate which of the transaction-based and relationship-based is the nature of interaction between the provider and target customer in the dimension 9, that can reflect the sustainability potential of system solutions (Gaiardelli et al., 2014). From the dimension 5 to 8, we could identify clearly the roles and nature of stakeholders in the system solutions, who own, provide, operate and use the water, energy and food installations/services. Different participants in

the system have different needs and sustainable requirements, which we can clearly define and describe them in dimension 10, it is conducive to the better implementation of decision-making and management of trade-offs in the Nexus system. Also, it is necessary to consider who/how to provide the capital financing supporting (dimension 4) in the system, cause the capital issues is one of the critical factors in low and middle-income contexts, which related to the system economic benefits in dimension 11. The system scale dimension determines the water, energy, and food supply unit supporting networks (nearby, local, regional network, etc.), that is effective to define the research scope of system and identify interactions of various hierarchical structures, allowing for more accurate and efficient planning, decision-making, implementation, monitoring, and evaluation of the system solutions. During the characteristics describing of S.PSS applied to DE in WEF nexus approach, the system breadth not only includes water-energy-food, but also other factors or resources nexus such as WEF-climate, WEF-land, WEF-Livelihood or which are related to or play a key role in system solutions. Finally, we can excavate and describe the sustainable potential of the system from three aspects of economic, environmental and social benefits (dimension 11), at the same time, it is desirable to predict or identify the risk factors that affect the progress of designing S.PSS applied to DE within the WEF nexus system (dimension 12).

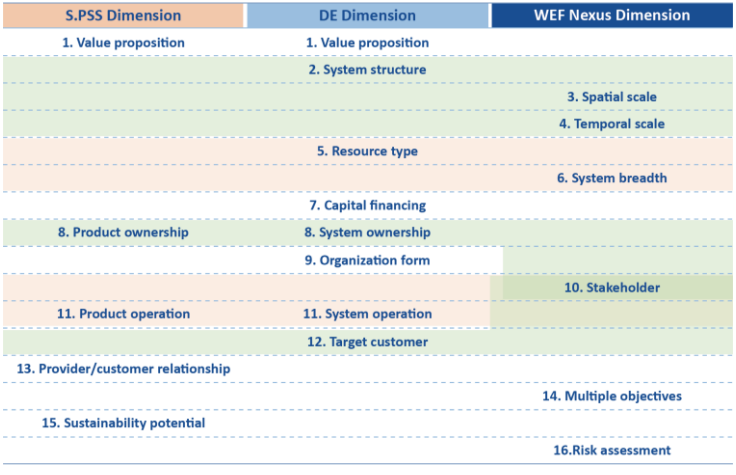

Figure 5. The dimensions characterizing S.PSS and DE and WEF Nexus, identified through literature review.

Dimensions Characterizing S.PSS applied to DE in WEF Nexus approach.

Dimension	Description	Details
1. Value proposition	It refers to the value offered to target customer, the payment structure in the WEF nexus system.	Pay-to-purchase (product-related service; advice; training;consultancy;additional services); Pay to lease; pay to rent/sharing/pooling; Pay-per-period; Pay-per-time; Pay-per-use; In-kind conctibution; Hybrid peyment; etc.
2. System scale	It could be characterized to summarize the interaction between stakeholders in WEF nexus system belongs to which hierarchical structure, to offer, transfer or gain the water, energy, food production/supply.	Decentralized WEF nexus; Distributed WEF nexus network ; Distributed WEF nexus network of networks; Hybrid WEF nexus network; etc. (13 archetypal system configurations in figure 4)
3. System breadth	The scope of the nexus and resources included. Due to the inextricable linkages among the WEF nexus system and their external resource and ecological environments, the nexus can evolve to embrace more resources or factors.	Water, energy, food; Water, energy, land, food; Water, energy, climate, food; Ecosystem, water, food, energy; etc.
4. Capital financing	Represents the means and/or organiztions of capital providing and related cost recoverying and revenue supporting for WEF nexus system.	Governmental subsidies, donations, private loans, micro-finance institution, etc.
5. Ownership	It referred to who owns the services and/or products of the WEF nexus system strictly related to the value proposition.	Customer or Provider
6. Organization form	The nature of the organization providing the WEF nexus system solution.	Public sector-based, utility, NGO, community, PPP/hybrid, private sector-based, etc.
7. System operation	It referred to who operates and manage the system.	Customer or Provider
8. Target customer	The nature of the end user.	Household, private company, community, or other productive activities.
9. Provider/customer relationship	Refers to the nature and intensity of interaction between the two actors in the nexus system and varies from transaction-based (product- orient-ed) to relationship-based (ues-oriented and result- oriented) depending on the responsibili-ties and activities performed on the product and/or service.	Transaction-based: product- oriented; Relationship-based: ues-oriented; result- oriented.
10. Multiple objectives	It refers to the consideration and application appropriately of objectives of each stakeholder in the system.	Resource demand, consumption, profit, cost, product quality, social welfare, etc.
11. Sustainability potential	The system solutions capable of creating the value decoupling it from resources consumption and environmental impact increase while extending access to low and middle-income people enhancing social equity and cohesion.	Economic benefits:cut initial/life cycle costs of water, energy, and food production/supply; Envionmental benefits: resource sharing and reducing resource cost; less waste; improve resource security; prolonging life cycle; Social-ethical benefits: improve customer fideli-ty; improve strategic positioning; increase opportunities in lower and middle-income contexts; etc.
12.Risk assessment	It refers to the events or activities that have a significant adverse impact on designing S.PSS applied to DE within the WEF nexus system.	Population growth, economic risk, extreme weather, conflicts, agriculture, technology, policy, etc.

Figure 6. The description and details of dimensions characterizing S.PSS applied to DE in WEF Nexus approach.

5. Case studies and analysis

In this section we selected three projects on the conditions of S.PSS applied to DE highlighted the interactions of water, energy, and food. The first case is providing solar Irrigation service to smallholder farmer and rural village in Ganga Basin, achieve the sustainable and affordable access to energy for pumping water with solar irrigation promotion, to increase irrigated area for more crops (figure 7). The second case promotes and facilitates the cisterns for rainwater harvesting and storage for vulnerable communities in Africa, to enable safe drinking water access and enhance family agricultural production and food nutrition security (figure 8). The last is vertical urban agriculture farm in Singapore, used rainwater to collect and reuse, plant waste to generate clean energy, and fish-vegetative hydroponics to experiment the WEF nexus solution (figure 9). All case analysis is based on the theoretical model i.e., the twelve dimensions characterizing S.PSS applied to DE in WEF Nexus approach, to verify the accuracy and completeness of the characteristic description.

CASE 1. Solar Irrigation Service Providers in Ganga Basin, India

Value proposition	Offering solar pumps with service related training, installation and maintenance. Customer pay per use or credit instalments.
System structure	Distributed solar network
System breadth	Water-energy-food (Solar energy, irrigation and underground water, crops)
Capital financing	Governmental subsidies
Ownership	Provider
Organization form	Private enterprise (young entrepreneurial farmer)
System operation	Customer
Target customer	Individual household
Provider/customer relationship	Relationship-based (ues-oriented product-service WEF solutions)
Multiple objectives	Village-sustainable management of solar irrigation; Smallholder farmers-less and low-cost energy consumption for irrigation, easy and affordable access to energy and water; Solar entrepreneurs-Irrigation services quality and quantity and income.
Sustainability potential	Environmentally: Scurtail carbon-footprint of irrigation; Reduce surface flooding by curtailing rejected recharge; Expand irrigated area, promote intensification and diversification of farming; Improve utilization of solar pump capital; Saving of diesel consumption. Economically: Quickly expand quality irrigation to the poor at affordable cost; Create 6-15 full time jobs/village; Incentivize solar irrigation service entrepreneurs to contribute to capital investment; Increasing net incomes for farmers and solar entrepreneurs. Socio-ethically: Improve water-energy-food security; Increase employment; Capacity building; Agricultural development.
Risk assessment	Irregular rainfall and climatic shocks; Irrigation management techniques; low-efficiency energy transfer; Diversity of crop cultivation.

Africa and parts of South Asia where the fortunes of millions of poor farmers continue to depend heavily on rain fed agriculture. The challenge is to expand irrigation access to the largest number of poor while keeping its costs affordable, without threatening resource sustainability and minimizing its environmental footprint. The arrival of solar pumps has opened up a new and attractive possibility. Solar Irrigation Service Providers driven village water markets will rapidly expand pro-poor irrigation, secure farming against climate shocks, promote sustainable intensification and diversification, improve utilization factor of solar pump capital, reduce carbon footprint of tubewell irrigation.

Figure 7. The analysis of the Case 1. Solar Irrigation Service Providers in Ganga Basin based on the dimensions characterizing S.PSS applied to DE in WEF Nexus approach.

CASE 2. One million cisterns for the Sahel, Africa		
Value proposition	Providing the water service with the training of construction, using, maintenance of cisterns. Customer get clean water and training pay-per-use.	The ambition of the programme "One million cisterns for the Sahel" is to promote and facilitate the introduction of rainwater harvesting and storage systems for vulnerable communities, especially women. The objective is to enable millions of people in the Sahel access safe drinking water, have a surplus to enhance their family agricultural production, improve their food and nutrition security and strengthen their resilience. To ensure better access to clean water during the dry season, these harvesting and storage systems are aimed to collect water during the rainy season-June to October-for its use during the dry season-November to May.
System structure	Distributed cisterns network	
System breadth	Water-food-climate (Rain water, vegetable production)	
Capital financing	Governmental subsidies	
Ownership	Customer	
Organization form	Local Community	
System operation	Customer	
Target customer	Individuals (Smallholder farmers,rural women)	
Provider/customer relationship	Relationship-based (ues-oriented product-service WEF solutions)	
Multiple objectives	Rural vulnerable communities-sustainable management of water resources; Smallholder farmers-clean water and climate-smart agriculture; Training for the empowerment of communities and local partners; Specific attention to gender(for rural women).	
Sustainability potential	Environmentally: Small-scale irrigation and agricultural water management as a whole are now essential to strengthen their resilience to the increased climate variability; Promoting the using of local materials.	
	Economically: Vegetable production is used for self-consumption and sales; Communities participate in the construction of cisterns through cash-for-work activities; Enable income diversification and improved housing conditions through construction sill training .	
	Socio-ethically: Improve their food and nutrition security; Enhance community cohesion; Promote the gender equality, Capacity building	
Risk assessment	Irregular rainfall and climatic shocks; Water management techniques; Agroecological inputs; Food diversity and clean energy for water	

Figure 8. The analysis of the Case 2. One million cisterns for the Sahel based on the dimensions characterizing S.PSS applied to DE in WEF Nexus approach.

CASE 3. Home farming project of spark architects, Singapore		
Value proposition	Offering the access of related plan, irrigations, energy generation products and services including the training and maintenance. Pay-per-period.	Home Farming is an example of responsing to the current aging population and the heavy reliance on imported food in Singapore. A high-density garden is designed combine the vertical urban agriculture on a vegetable farm by Spark Architecture, used rainwater to collect and reuse, plant waste to generate clean energy, and fish-vegetative hydroponics. Other means to solve the problems of urban population aging, food security, and energy-food resource connection sustainability, provide a comfortable living care environment for the elderly, and achieve a coordinated treatment of aging society and food safety issues.
System structure	Distributed network of networks	
System breadth	Water-energy-food (Irrigation water, food, bioflues)	
Capital financing	Private loans and Governmental subsidies	
Ownership	Provider	
Organization form	Community & Cooperative enterprise	
System operation	Customer	
Target customer	Individual household	
Provider/customer relationship	Relationship-based (ues-oriented product-service WEF solutions)	
Multiple objectives	Communities-sustainable management of WEF resources and living conditions; Individuals-clean and safety WEF, better living environment; Enterprise-sustainable business model; Specific attention to the elderly and aging society.	
Sustainability potential	Environmentally: Promoting the reusing of waste plant and water, Sustaiable energy transfer ways; Reduce transportation and packaging; None carbon dioxide emissions; Maintenance and repair service sextend the product-service system life.	
	Economically: Food production is used for self-consumption and sharing; Creating more economic benefits with less land resources; New opportunities and markets for the promotion of bioflues; All-inclusive services improve the fidelity of the customer.	
	Socio-ethically: Achieve a coordinated treatment of aging society and food safety issues.; Capacity building.	
Risk assessment	High costs for hardwares/equipments; Farm management; Uncompleted recycling service.	

Figure 9. The analysis of the Case 3. Home farming project of spark architects based on the dimensions characterizing S.PSS applied to DE in WEF Nexus approach.

After the analyzing of the case studies, we can conclude three main characteristics in the applications of S.PSS applied to DE in WEF Nexus approach:

- The WEF system solutions shift from high-cost and centralized product ownership to the access to sustainable affordable and nearby WEF supply service network under the application of S.PSS and DE models, which transfer from the product-based offer model of water, energy and food (e.g. irrigation, planting, pumping, power generation equipment) to product-service even service-based sustainable offer model of WEF nexus system (e.g. reducing/avoiding initial investment, providing life-cycle service and cut related cost, community network and individual capacity building).
- Identified the synergies of water, energy and food, rather than the separation of them, is conductive to the multi-objective decision making of the nexus system, leading to more comprehensive and sustainable design, management and implementation of WEF nexus system.
- The practical results of the case reflect the promising potential of S.PSS applied to DE in the WEF nexus approach is a win-win strategy for its environmentally, socially and economically sustainable diffusion to all, especially in low and middle-income contexts (case 1 and 2).

Additionally, the challenges of applying the twelve dimensions characterizing to the case studies are exposed in the process of analysis, that can be summarized briefly as flowing:

Completeness of analysis. The all twelve dimensions basically cover the value, stakeholders, interactions, system potential and risk. However, the specific interactions of all stakeholders involved in the nexus system have not been well defined in the dimensions, and the relevant information analysis of the material, information, labour and finance flow in the system has been neglected.

Accuracy of description and ease of using the dimensions characterizing. The method is based on qualitative analysis without the visual and quantitative description guidance, which will affect the accuracy of case description and increase the difficulty of analysis. The description of the system scale is not as impressive and easy to understand as the graphic display (dimension 2). It is difficult to compare the degree of sustainability between cases from the existing description of sustainability potential (dimension 11). And for the characteristics of risk assessment (dimension 12) are given in generalities, lack of specific directions and guidance of expression.

6. Conclusion

In this paper, we draw support from the experiences of designing S.PSS applied to DE in the LeNSin project, and give the first outcomes of the research hypothesis of a key role in designing S.PSS applied to DE focused on the WEF nexus, by identifying and characterizing

S.PSS applied to DE in WEF Nexus approach. We stress that the approaching of water, energy and food not separately, but as a nexus approach, i.e., as a system to be designed, implemented and managed is extremely promising in terms of sustainability. And characterizing the S.PSS applied to DE in WEF Nexus approach have been developed and presented by twelve dimensions description, based on the exploration, analysis and summary of the key issues and features among the S.PSS, DE and WEF nexus models. The selected cases involved in the WEF nexus solutions have been analyzed with the twelve dimensions, to help verify the completeness and accuracy of characteristics description, also exposed the challenges in characterizing the S.PSS applied to DE in WEF Nexus approach. All that will make progress on the further work to explore and develop WEF Nexus oriented concepts, design strategies and tools to support for companies, practitioners and designers on how to manage trade-offs and build synergies in designing the resilient and sustainable WEF Nexus system to achieve the sustainable access to clean water, energy and enough food for all, finally to effectively contribute to the transition towards a sustainable society for all.

Discovering Design Values in the Chinese Pre-Qin Classics

Miaosen Gong*[a]

[a]School of Design, Jiangnan University, Wuxi, China
*miaosen.gong@foxmail.com

Abstract | Based on facts and historical observations, this paper puts forward the hypothesis that Chinese culture, especially pre-Qin classics (先秦经典), contains the wisdom of sustainable development. Through the study on representative pre-Qin classics, the author summarizes the thoughts on the world outlook, outlook on life and sustainable way of life in the pre-Qin classics: Tao generating all things (道生万物), the unity of universe and human (天人合一), and following the law of universe and earth (法天则地). Then author proposes design implications on sustainability with three aspects: design ethics, principles, and the dialectical relationship between man and nature. Three design proposals is also reported as tentative applications of relevant discussion. These exploration and tentative opinions may help to view sustainable design in the perspective of Chinese traditional culture and provide support to enrich the theories and reflections on sustainable design.

KEYWORDS | CHINESE CULTURE, PRE-QIN CLASSICS, SUSTAINABLE DESIGN, THE TAO

Design is the conceiving and planning of purposeful creative activities, and it is also one of the important intellectual activities that distinguishes human being from other animals. Design is rooted human civilization and culture, although the history of term "design" is relatively new as a discipline. In last decades, the scope of design has been extending and gone beyond of artifacts, for example, design for social innovation focuses on the change of people's behavior. In this case, beside enabling conditions, the fundamental cause of the behavior change is the change of people's recognition and understanding. To some extent, design also participates in the process of culture construction. Therefore, the essence of design is closely related to the origin and development of human civilization. This article tends to look into the Chinese traditional culture by pre-Qin classics and discover related design values on sustainability.

1. Assumptions on Chinese civilization

As one of four ancient civilizations and the only living one, in the majority period of human history, China had been the world's central empire with authoritative history and profound culture until the modern time, when missing the first industrial revolution, China went to a temporary week in last two hundred years. And very soon it becomes one of leading countries again. History tells us some basic facts: on the one hand, Chinese civilization has superior and high resilience of survival and sustainable development. In the historical period when China has leadership in world, there has been no global order collapse such as two world wars and the collapse of environment and ecosystem on another. Therefore, this paper puts forward a first hypothesis: Chinese civilization and culture contains the wisdom of sustainable development, and discovering and understanding it may contribute to the common future of entire human society.

There have been a large number of studies on China, Chinese people and Chinese culture, both by Chinese scholars and by non-Chinese ones. While most studies focus on phenomena whether in contemporary or history of China, especially in the field of social sciences. the study of current and historical phenomena about China and Chinese people is a relatively easy path to understand China and Chinese civilization. However, the fragmentation and complication of phenomena, together with the limitations of researchers, make the conclusions intricate and even misunderstanding. Hence, history also tells us some further basic facts: in the terms of social form and moral level, the degree of social civilization and well being in ancient times were very high: China had been great harmony society in the period of the Three Primordial Sovereigns(三皇时期) and the Five Emperors(五帝时期). It was a well-off society in the period of the Three Kings(三代三王). Afterward, the dynasties changed continuously after the Spring and Autumn Period and the Warring States Period. Then the cycles of dynasties became shorter and shorter. Therefore, the second hypothesis is put forward: in the viewpoint of culture, the history of Chinese civilization is a process of

degradation instead of advancement. It means that trying to understand the essence of Chinese culture must trace back and discover the source of Chinese civilization, which are the Chinese pre-Qin classics, such as Dao De Jing: The Classic of the Virtue of the Tao(道德经), The Book of Changes (易经), Inner Canon of the Yellow Emperor (黄帝内经) and Huang Di Yin Fu Jing (黄帝阴符经).

2. Tracing Chinese Culture in pre-Qin classics

2.1 Tao generating everything, a complete view of the universe

Where does everything in the universe come from? How does it work? What drives it? The answers to these basic questions constitute different forms of civilization and culture. With advancement of human understanding, current scientific cosmology has been the latest, getting rid of various versions of obscurantism, and also the common understanding of academic community internationally in principle. However, the scientific cosmology does not answer the question on the first cause of the universe. The scientific theoretical system couldn't reach self-consistency and completeness both at the same time. Hence the scientific explanation of the universe is constantly updated and seemingly endless.

In the pre-Qin classics, the Chinese ancients put forward the "Tao (道)", "Tao generates one, one generates two, two generates three, and three give birth to all things. (道生一、一生二、二生三，三生万物。万物负阴而抱阳，冲气以为和)"(Dao De Jing-chapter 42) . Lao Zi holds that the source of all things and the universe is the Tao, which gives birth to the Qi of Hongmeng (鸿蒙之气), and then gives birth to the two Qi of Yin and Yang, and combines them into third. All things in the universe are formed by the combination of the two Qi of Yin and Yang and the that of Hongmeng. "Tao is independent and constant, circulating without ending. It is the mother of the world (有物混成，先天地生。寂兮寥兮，独立而不改，周行而不殆，可以为天下母)" (Dao DE Jing, chapter 25), although the Tao continuously generates, evolves all things, but the Tao itself is constant without lose and end. In short, the Tao is fundamental to the formation, movement and evolution of everything, but everything has no influence on Tao itself. At the same time, "the so called Tao that can be described is not constant Tao, and the so called Ming that can be named, is not constant Ming (道可道，非常道；名可名，非常名)"(Dao De Jing chapter 1)," I do not know its name, but give a word of Tao, reluctantly name it as Big. (吾不知其名，字之曰道，强为之名曰大) " (Dao De Jing chapter 25), it pointed out that Tao can't be described in nature, of course, which doesn't mean unknowable. "Tao is something imperceptible (道之为物，惟恍惟惚)" (Dao De Jing, chapter 21). Lao Zi believed that being "to the extreme of emptiness and to the extreme of tranquility (至虚极，守静笃) " (Dao De Jing, chapter 16), one could feel and identify Tao. This means that at least very few people who can be called Zhenren (真人) or Shengren (圣人) are able to experience and

comprehend the Tao. The classics are the true words of them, so that ordinary people and readers can learn the Tao through them.

2.2 The unity of human and universe, a forward outlook on life

In addition to the question of the origin of the universe, Plato then posed three ultimate questions: who am I? Where do I come from? Where am I going to? The various answers in history also constitute different paths of western civilization. From the perspective of Chinese pre-Qin classics, these are not the ultimate questions and the answers are also simple: I am the “son” of universe and earth. I come from universe and earth and will go back to there. Since everything and the universe are created, formed and evolved by Tao, man is either no exception. "Human is generated by the Qi of universe and earth with the law of four seasons. (人以天地之气生，四时之法成)"(The Inner Canon of the Yellow Emperor-Preserving life). Specifically, Tao generates universe and earth, and universe and earth generate all things, including human. Therefore, man is a part of the universe, which is governed by Tao and the universe. It is meaningless to talk about life and value without the premise of universe and earth.

Although universe and earth are a whole one and human is a part of it, human is also a special part. "covered by universe, loaded by earth, all things are around and nothing is more precious than man (天覆地载，万物悉备，莫贵于人)" (the Inner Canon of the Yellow Emperor -preserving life). Man is the most noble part of all things. "The Tao is great, the universe is great, the earth is great, and so is the human. There are four great beings, and human is the one of them. (故道大，天大，地大，人亦大。域中有四大，而人居其一焉)" (Dao De Jing, chapter 25). Why is human one of the great four? On the one hand, compared with other things born in universe and earth, human being have the ability to know the Tao and understand the world; On the other hand, in order to adapt to the survival and development, human beings have the ability to transform or resist the nature and create something new. Therefore Classics not only acknowledge that man is a part of the nature of universe and earth, but also emphasizes the uniqueness of man.

2.3 Following the law of the universe, a normal way of living

After understanding the world and human ourselves, how can human beings produce, live and reproduce? "human, earth, universe and the Tao, they follow the law of the next one after another (人法地，地法天，天法道，道法自然)" (Dao De Jing-chapter 25). human is generated by universe and earth and governed by the laws of them. On this basis, the idea of "the isomorphism and correspondence between universe and human (天人同构、天人感应)" is further derived, which holds that universe and human have the same structure in different scales, therefore they are both organic parts of the same one, a large living body. In the same level of structure, they are communicating and corresponding. This is also a core idea of Chinese medicine represented by *Inner Canon of the Yellow Emperor (黄帝内径)*.

Universe and earth generate all things and human. human and the universe are part of the same one. so all things and human can be only in a state of normal when they follow the law of universe and earth. In nature, all living things follow the law of universe unconsciously exception for human being who have intelligence and stand out of the nature, at the same time they have ability of cognition and judgment on universe and all things. So that to following the law of universe becomes a conscious behavior. Whether following well the law of universe and earth or not will directly result in different results, and will also affect the state of universe and earth to some extent, but it can't change the law of universe and earth and the way of effect on human, which is so called "universe and earth are nothing kind and they regarding everything as mere nothing (天地不仁，以万物为刍狗)" (Dao De Jing-chapter 5). Tao is constant and in the view of human, the movement of universe (celestial bodies) is almost constant as well. Therefore, anchoring the universe and following the law of it means to a normal and sustainable way of live of human and human society.

How did the ancient Chinese follow the law of universe in practice? The first sentence of the *Huang Di Ying Fu Jing (黄帝阴符经)* says: "Observe the law of universe, and follow it. That's all. (观天之道，执天之行，尽已)" In the ancient farming society, it refers to astronomical observation and calculation to make a calendar, so that people can work on agricultural production and everyday life according to the calendar. Therefore, to some extent, astronomical observation is the origin of Chinese civilization, and following the law of universe and earth is also the core of Chinese culture.

3. Implications on sustainable design

3.1 The Tao generating all things and universe being constant: towards design ethics.

According to the thought that Tao generating all things (道生万物) and the unity of universe and human (天人合一), human beings, as a part of the universe, is under the law of it. For human, the law of the universe and movement of celestial bodies in space is almost constant. So it provides the fundamental criterion of sustainable development for human society. In other words, anchoring the universe, the optimal state of all things and mankind is definite and unique. When they are in full compliance with the law of universe, they can remain normal and sustainable way of being and complete the natural life cycle. On the contrary, when they are not in accordance with the law of universe, they go out of normal, causing morbidity and damaging the life cycle. Therefore, the universe being constant (天道有常) enriches design ethics of sustainable development. The design conforming to the universe is good design and promotes sustainable development, while the design that does not conform to the universe is bad design and causes unsustainable development. For example, the current increasingly serious plastic waste and their wide pollution, against the law of universe and nature, causes damage of the natural environment. It is worth pointing

out that there is only one best sustainable state for things since the universe is constant, while there could be many different kinds and degrees of unsustainable states.

3.2 The unity of universe and human and following the law of universe: towards design principles.

The constant universe forms the fundamental criterion and design ethics of sustainable development, hence following the law of universe is a basic principle of sustainable design. Only the design obeying the law of universe can promote people's sustainable way of being and doing. Taking agriculture as an example, it is a typical production by law of universe and earth, otherwise the quantity and quality of harvest would be affected. On the contrary, if the design violates the laws of the universe, it would lead to unsustainable way of living and producing. For example, when it is cold in winter, clothes help us to keep warm. If wearing a designed clothes with bare skin, people may catch cold and get sick. In a word, everything and human must follow the law of universe and earth in order to be healthy, normal and sustainable. Therefore, following the law of universe and earth is a basic principle of sustainable design. The law of man is the law of universe and earth, imitates the creation of universe and earth, embodies the simple beauty of objects, and also constitutes the aesthetic standard of sustainable design.

3.3 People-oriented, and universe-rooted concept: towards a dialectical relationship between human and nature.

Human is the most intelligent part of all creatures, and it’s one of four great together with universe and earth. The fundamental purpose of all human activities is the survival and development of ourselves, so sustainable design is also based on the people-oriented concept, but because of the unity of universe and the law of universe, the precondition of people-oriented is to anchor universe and earth. Without anchoring universe and earth, it is easy to violate the law of universe when we design in a people-oriented approach. so as to guide an unsustainable result. For example, simple standing the human’s needs point of view, it appears the phenomenon of mass exploitation of natural resources, mass production and consumption of products and services, to meet the material consumption in the short term, but damaged the ecology and environment, which will eventually harm the sustainable development of people. In other words, it’s necessary to build a harmonious relationship between human and nature. On the one hand, the ultimate purpose of design is for human, but man and all things in nature are one. Anchoring the universe, following its law and protecting nature is fundamental to pretest ourselves now and future. Furthermore, to each individual, physical health is the foundation of sustainable development, with the idea of "the isomorphism and correspondence of universe and human", to conform to the laws of the universe is essential to keep the normal of health of individual as well, in which, the precondition is the nature and environment is normal and healthy. Otherwise, there will be a gap to obeying the law of universe, so as to damage people's health eventually.

4. Tentative design applications

The design implications above of Chinese culture in pre-Qin classics provide new intentions and opportunities on sustainable design. While those design ethics, principles and dialectical relationship are still quite abstract understanding. How to apply them to concrete design solutions and create value for everyday life? It's another challenge that we have explored. Following design works are tentative applications of previous discussion and finding on design ethics and principles, toward situations of reality today.

4.1 A Chinese calendar with local season foods

Chinese calendar was for agriculture in history while today people mainly use it for agenda management with west solar calendar, which indicates that human have been divorced from the universe seriously. This design proposal aims to increase user's awareness of local and season foods and enable them to have better food plan, as shown in Fig. 1 and Fig. 2, in order to reconnect the human and the university by food towards a healthy and sustainable lifestyle.

Figure 1. A Chinese calendar with local season foods.

Figure 2. Illustrations of local season foods on Chinese calendar.

4.2 A set of home furniture for Chinese Zheng Sitting

Zheng Sitting (正坐) is a normal way of sitting without chairs before Han dynasty in China, which conforms to the unity of universe and human, while it has disappeared for a long time although it can be regarded a best way of sitting with significant advantage of health. This design proposal is a set of home furniture for Zheng Sitting in average apartment, as shown in Fig. 3 and Fig. 4.

Figure 3. A scenario of home furniture set for Chinese Zheng Sitting.

Figure 4. A set of home furniture for Chinese Zheng Sitting.

4.3 An office chair for Chinese Zheng Sitting

Spinal disease is popular among white collars for long time sitting. Zheng Sitting exercise is a best way to recover or keep health as the attribute of unity of human and universe while It's not optional to change office furniture and way of working. How to make it possible to exercise Zheng Sitting in average office. As shown in Fig. 5 and Fig. 6, this proposal creates a minimum change that an office chair can be adapted for two sitting postures of both Zheng Sitting and Hu Sitting(胡坐).

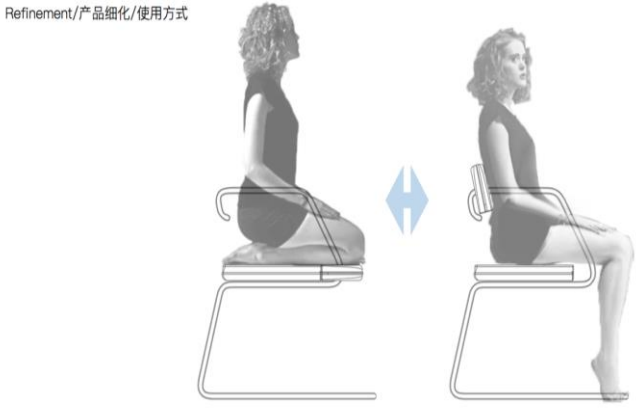

Figure 5. An office chair for Chinese Zheng Sitting.

Figure 6. Posters of an office chair for Chinese Zheng Sitting.

5. Conclusions

This paper is an attempt to trace the roots of Chinese culture in a perspective of design and discover the wisdom of pre-Qin classics, especially for the values on sustainable design. These thoughts and ideas of the pre-Qin classics enable us to treat the challenges of survival crisis and sustainable development in a holistic and dialectical perspective, and put forward more effective design theory, principles and methods on sustainability, towards a more resilient and sustainable society in the future. Admittedly, our understanding of pre-Qin culture is still very limited on the one hand, and our theories and methods of sustainable design are still far from meeting the challenges and demands of sustainable development on another. Therefore, there is a lot to be done, among which one thing is clear: new design cultures and reflections are necessary for the common future of human society.

Insights from an ongoing intervention with design school faculty

Rakefet Kenaan*

*rakefetkn@gmail.com

Abstract | The paper presents an intervention with faculty members at a college of design, aimed at exploring the potential of design and design education to serve as meaningful forces for social and environmental change. The intervention has taken the form of an ongoing Action Research group, in which the members' main practice is to exchange diverse 'materials' amongst themselves and to artistically respond to them. In this manner the group engages in 'autopoiesis'; e.g., acts as an organ that creates itself while interacting with and influencing its surroundings. The project is philosophically rooted in deep ecology and systems theory. Its outcome has been to create a new social space that has had a transformative effect on the group members as artists and professionals, trickling into the teaching atmosphere of the college and leading to fruitful collaborations outside it as well.

1 *and out of nowhere*
it dawns on you
that blossoms are fruit

Melissa Allen, 2015

1. Introduction

This article presents an ongoing Action Research project with faculty at an Israeli college for design. The group comprises 12 faculty members who began, in early 2017, to experiment with alternative modes of collective and artistic action in response to the challenges of the environmental crisis.

The design world is a primary leader of aesthetic, practical, communicative, and artistic trends, and wields a powerful influence in contemporary culture and on the management of human affairs. At the same time, coping with environmental challenges is difficult for designers, whose professional activities are usually subservient to industrial and economic interests. In addition to the powerful hand of the market, the design world also suffers from an excessive deference to disciplinary divisions, which limits fruitful dialogue between design, social science, and environmental concerns (Latour, 1993; Lefebvre, 1991; Rabinowitz, 2009). At the Shenkar Design College, for example, environmental considerations are often seen as an intrusion that complicates the aesthetic beauty and joy of design. When issues of sustainability do enter the curriculum, as they have been increasingly over the past decade, they appear as a mainly technical affair, divorced from mainstream studio courses. This sends an unfortunate double message — that environmental concerns exist, but somewhere set apart from and secondary to 'real' design values.

The Action Research project, presented here, sought to disturb this conceptual dichotomy within the context of the academic field of design education. The intellectual underpinnings of the project draw from the philosophy of 'deep ecology' and from Action Research methodology, particularly as articulated by Keiny (2002), a biologist who translated elements of ecology and system thinking into explicit principles for Action Research. The group modells itself metaphorically and practically as an 'ecosystem,' in which the members, as 'organisms,' interact in a manner that is both collaborative and indeterminate. The key practice in the group is the exchange of 'materials' between the members, where members individually 'metabolize' these same materials and produce artistic responses to them.

2. Theoretical background

Deep ecology is an environmental philosophy that critiques the domination and exploitation of nature by human beings. It calls on us to recognize our species as part of a web that

sustains all life on the planet, and in which nature has inherent value independent of its instrumentalization by humans (Capra, 1996; Capra & Luisi, 2014; Naess, 1986; Orr, 1994). In a similar critique, Merchant (1980) has argued that in the West, to understand nature almost necessarily means to rule it. This understanding is often calculative and is driven by a belief in infinite growth and inevitable technological progress, while devaluing the forces of compassion, imagination, memory, and non-scientific knowledge. Similarly, Capra (1995), a physicist and system theorist, argued that amending relations between humans and nature requires a re-evaluation of the traditional epistemic hierarchies between rational versus intuitive, reductionist versus holistic, and linear versus non-linear thinking (Capra, 1995). He referred to this as a shift to "system thinking," and paralleled it with the paradigmatic change over the 20th century from the mechanistic to the ecological view of nature. I.e., while the mechanistic approach treats natural phenomena as discreet working parts, the ecological view is more holistic, treating nature as a multitude of systems constantly interacting with and influencing each other, and in which a change in any part of the system can affect every other part (Capra, 1996; Maturana & Varela, 1980).

'Action research' is a collaborative research practice in which researchers and participants mutually produce academic knowledge, in the course of practical action in the world (Levin, 1999). There is no 'one size fits all' method for doing Action Research, but variants on this research tradition all share the view that valuable knowledge pre-exists the researcher, and should be recruited collaboratively with participants, towards the goals of social change and improving lived reality (Greenwood & Levin, 2006).

Shoshana Keiny was a biologist and educator who was deeply influenced by modern ecology, particularly the idea that humans should be seen as part of the systems they study. She articulated eight principles of 'ecological thinking' that could be applied in experiential science education and that are consonant with the spirit of Action Research (Keiny, 2002; 2006). They are: *Holism* — the group cannot exist without its constituent 'parts,' yet always constitutes something greater; *Self-organization* — complex systems are assumed to organize themselves from within, based on the qualities of interactions between components; *Interaction* — analysis should focus more on what happens between components, than the components themselves; *Contextuality* — phenomena must be understood in relation to the particular time and place where they occur — in other words, all phenomena are inseparable from their environment; *Causality* — phenomena in the system do not have a distinct start or end point, thus 'causes' and 'effects' cannot be attributed with certainty, but are always interchangeable; *Subjectivity* — reality is constructed by the observer who is also part of the ecosystem, and multiple interpretations are always possible; *Reflexivity* — subjects can and should reflect on their reality and act to change it; and finally, *Indeterminism* — outcomes of group interactions cannot be controlled or predicted in advance.

In her approach, Keiny compared Action Research to an ecological system, paying attention to interactions within the system, much in the way that communities of organisms are

studied in modern ecology (Odum, 1953). She called the central tenet of her approach *reciprocity*, the idea that humans have a double role in the system: Both as actors and observers, they shape the system and are shaped by it.

3. Context

Design holds a highly ambivalent and contradictory role in the national culture of Israel. On one hand, Israeli culture promoted the Romantic legacy of emotional connection to nature, as a vehicle for national revival (De Shalit, 2000). The ethos of modernist and utilitarian design was also highly influential on the state's founders and early leaders. At the same time, environmental and aesthetic concerns are usually devalued as trivial occupations, compared to the existential concerns of immigrant absorption, settlement, and national security (Sela-Sheffy, 2011).

The Action Research project was carried out at the leading design college in the country, serving about 1,500 students and enjoying an international reputation. It speaks a language of 'professionalism', 'excellence', prioritizing clear 'goals', and 'efficiency'. The discourse of sustainability is still a relative newcomer at the college, and environmental considerations are not yet merged into the core design curriculum. As is often the case in design education, students are encouraged to solve problems efficiently and beautifully, given strict parameters, but without disturbing the infrastructures or meta-discourses in which a design product will take its place. This problem is not exclusive to the college but reflects the paradoxical relationship that exists between design and social research more generally (Albrecht, Lupton & Holt, 2000; Irwin, 2015; Ventura, 2014).

4. Method

Prior to establishing the group, I carried out an exploratory study to flesh out how people at the college relate to environmental topics and what sustainability means to them. In the exploratory stage I interviewed about 30 faculty members, students, and department heads whose work touched on social-environmental concerns. The interview materials were rich but a bit dissatisfying. I thought — 'We're designers, let's create something relating to the environment instead of just talking about it.'

The Action Research group included five men and seven women (including myself) of diverse ages, both junior and senior faculty, representing all six departments in the college (fashion, textiles, visual communication, industrial design, building & environment design, and jewellery). The group is ongoing, meeting bimonthly since early 2017 through the present.

The first meeting began with an explanation introducing the Action Research, and a summary and reflection on the personal interviews that had been conducted ahead of the meeting. In the first few meetings, the priority was to provide a space for each member to

bring their professional interests and sustainability personal standpoint to the table, while establishing a culture of transparency and trust that would enable the group to work as a community. Following each group meeting, I sent a summary and reflections to all the members.

Over three years, the most important working principle for the group has been to acknowledge the inherent value of each member, without judging or sanctioning any member's particular 'design' contribution or mode of participating in the group. In many respects the group manifests Keiny's (2002; 2006) principles of 'ecological thinking': Decisions are reached organically, through mutual conversation, and everyone is listened to and treated as an equal member. The group engages in frequent *reflection*; its activities prioritize *indeterminacy* and *interaction* among members over discreet products and finite results. Most critically, the group evidence *self-organization*, acting as a complex system that creates itself through interaction between the different parts. The principle of self-organization represents a culmination of the elements of ecological thinking.

5. Group Metabolism

In *The System View of Life*, Capra and Luisi define a living organism as characterized by two processes. One is the ability to absorb external materials, which it uses to build itself and to determine its molecular identity; and the other is having an internal metabolic system which allows the living organism to continuously create, repair, and renew itself (Capra & Luisi, 2014). Building on the concept of "self-making" (or "autopoiesis"; Maturana & Varela, 1980), they hold that self-generation is the defining characteristic of living networks:

> "Living systems continually create or recreate themselves by transforming or replacing their components. In this way they undergo continual structural changes while preserving their web-like patterns of organization,"

creating a "coexistence of stability and change" (Capra, 2018). Organisms constantly respond to their environment, but these interactions cannot precisely determine and direct their influence on the living organism, its interior state or response to change. Picking up from these ideas, the group sought to model itself as an analogous kind of living entity, to embody an 'ecosystem' in which members — 'organisms' — interact and create in a shared space of 'metabolizing' materials.

The first task the group came up with was to exchange 'gift materials' among the members. The purpose was to trigger dialogue and to jumpstart the group's creative activity. The plan was as follows:

> "Each person is requested to give and to receive 'gift material' to someone and from someone else in the group. Each person will respond personally, in a visual, artistic, physical, active way to the material received from the other person. For the purposes of this task – 'material' can be anything having substance and definite

> properties. Concrete palpable material perceivable through the five senses, or conceptual material such as a text or memory."

The members were also encouraged to document the process — coming up with an idea of what to give as a gift, how to present it to the receiver, and any sketches, decisions, data processing or other stages in developing their work in response to the gift that was received. The idea was that each person work on something that interests them, triggered by someone and something external to them — together and apart at the same time.

Here I will trace some examples of material gifts and responses, to help characterize the collaborative, distributed and indeterminate character of the group's activity. This mode of operation was highly unusual for faculty, who are generally used to working in isolation, following strictly defined goals and parameters for their design projects.

An industrial designer was interested in relationships between natural and synthetic materials. Among other projects, she created hybrid objects that represent functional and morphological dependence between sweet potatoes and water containers, which she designed and printed using a 3D printer. She called them "vases that are like infusions for sweet potatoes." For example, in one of the designs, the plastic container includes a straw that penetrates into the sweet potato, providing it with water, while the sweet potato serves as a leg that stabilizes the plastic object and keeps it from falling down. The two aspects, the potato and the plastic, cannot exist separately; if they are separated, the container will fall, the water will spill, and the sweet potato will dry out. These experiments led to a necklace-like object featuring the sweet potato roots, which she passed on as a 'material gift' to the architect.

This awoke in the architect an interest in root growth, and in associations with family roots and genealogical tables. In his studio, his eyes stopped on a gift he had received on completing his architectural studies — a book on the city of his birth, La Plata, Argentina. The city of La Plata was planned on modernistic ideals, on a grid and diagonals, and its map resembled, to his mind, the shape of seed-starting trays. The similarity between the two forms, the municipal grid of La Plata and the seed tray, led to the creation of a hybrid image of roots with a sketch of a map of the city. He then examined the hybrid image through the lens of 'Space Syntax' — a research field, popularized in the 1970s, for examining interrelations between the design of structures and their social use patterns. The architect's aim was to explore the correlation between the planning data and the urban logic of the city, versus the spread of roots, as a possibility for urban research inspired by botanical forms (see Figure 1).

Figure 1. Root studies.

Another industrial designer, who keeps a personal collection of mousetraps, presented one from his collection to a fashion designer. For the industrial designer, the mouse traps represent a deeply felt conflict between ethical purpose and professional success ("Build a better mousetrap, and the world will beat a path to your door"). The receiver saw the gift as a symbol of her being "trapped" in fashion consumption. Responding to the mousetrap, she experimented with the deconstruction of used denim and created prototypes of jackets and other one-of-a-kind apparel made from second-hand material. She was able to connect with a fashion company that collects and repairs used jeans from its clients, and which kept a large stock of used denim. About ten more prototypes followed. Ultimately, the fashion designer partnered with an NGO that supports women coming out of the cycle of sex work, providing personal supporting and professional training as seamstresses.

The output in the group was fascinating and strange, blending familiar and recognizable forms in new ways. An architect presented a jewellery designer with a large, living palm leaf, who approached it as one would diamonds or gold, polishing and neutralizing its morphological history and extracting from it a small, jewel-like object — the remainder designated as 'waste.' A textile artist presented a graphic designer with a specially prepared scrapbook of used, bound paper (wrapping paper, toilet paper, old receipts, and so on). The receiver, who has a theoretical interest in skin, used this opportunity to do things to the paper "that are done on skin, to peel, to tattoo, to scar." Other 'gifts' took the shape of a task, such as visiting the beach, a botanical garden or a leather importer. Not all gift materials succeeded in triggering an ongoing process of iteration and response among the participants; some led to a limited dialogue or opened a possibility for future conversation that has not concluded. Figure 2, below, provides a taste of the array of material gifts and responses that came about in the group.

Figure 2. Array of gift materials and responses by the Action Research group.

The matrix of 'gift material,' which began as a preliminary exercise to set the group in motion, gave rise to a style of interaction that defined the social space of the group as a whole. It nurtured mutuality and dialogue between faculty who did not previously know each other, and fostered commitment to the group. Over time, another ritual developed in addition to gift-giving: sharing knowledge worlds and research activities, in the form of a short personal lecture at the beginning of each meeting by a different group member. These lectures sparked discussions that also became, in themselves, part of the group's agenda for the meetings.

6. Outcomes

Two years into the life of the group, I conducted 2-hour, semi-structured interviews with each member to assess their evaluations of the group.

Evaluations were generally highly positive. Words like "trust," "freedom," "support," "belonging," and "empowerment" recurred in the interviews. For example, one participant said that the group "allows each person to feel that it belongs to them, and that they are a part of it." Another reflected: "The freedom and the value accorded to each person, the opportunity to communicate and interact and share your personal process, is empowering."

The features that group members found most challenging in the Action Research project were its indeterminacy, the absence of explicit instructions or direct control over outcomes. The male group members, especially, bristled that the group did not provide a structured work plan. For example: "I didn't think the model would work… I was suspicious that without a definite goal, the group would fall apart." Another said: "I need the security of knowing where things are headed, but I was willing to let go since [the group] wasn't my sole responsibility." However, for most participants, these same aspects were the most rewarding: "I learned a different style of management… [treating] flexibility as part of the agenda… allowing things to be articulated as you go along." Another said: "I have always looked for yes/no answers and it always led me to a dead end… The surprising and meaningful benefit for me was that… environmental questions are complex and there is more than one language to speak them." A third added: "Usually I am super in control. I like to label information, and here I can experience things without knowing where they will lead."

Another cluster of responses within these assessments, related to the influence of the project on the members' teaching. Overall, the members noted that experiences in the group had a positive impact, inspiring their teaching, providing ideas for assignments and affecting their relationships as instructors. Interestingly, several members used the word "sub-conscious" to describe these effects: "Subconsciously, I insert it into everything that I teach," said one member. "I feel that it subconsciously impacts my interpersonal experiences as an instructor," said another.

Design education is usually competitive and goal-oriented. The group provides an opportunity to take cues from natural systems that don't have a prescribed leader or goal, but rather to experience relations that are non-hierarchical, indeterminate and mutual. The activities of reflection, giving each other strange 'gifts', and being vulnerable in a professional setting are markedly unconventional activities in the context of the classical training or 'socialization' of design professionals. These activities force colleagues to explore alternatives styles of relating to one another, and by extension, to the shared natural environment.

The gift-giving practice was a central methodological axis for this process. Some members experienced the gift-giving act as a 'test' which they might fail as a giver or receiver (if the gift did not motivate or inspire creativity, for example). Gift-giving required each member to acknowledge and be aware of how the receiver thinks, what will interest or move them, as well as relinquished their full control over the creative process, which will be initiated by others. Design typically worships the vision and genius of the individual designer; here, the act requires designers to operate in relation to other people, to cede control to the group and be vulnerable. Moreover some members felt defensive or distant from the group, or struggled to find an effective role in it. The activities thus illuminate some potential costs of changing our relationship as humans and designers to planetary sustainability: discomfort,

dependence, unpleasant novelty, role confusion, disappointment, and creative frustration, can be expected at least to some degree.

The gifts also spurred specific critiques and experiments relating to sustainability and design. The example of the 'better mousetrap' interrogates the kinds of relationships that common designs foster between humans and other living beings. The example of the palm-leaf caricatures the implicit manner that aesthetics encourage us to instrumentalize natural resources while disregarding subsequent waste. In the examples of the 'roots' series, the participants critiqued the prevailing design ethos that usually trains us to erase nature or dominate it. This was demonstrated in an extreme form (the vegetable roots completely constrained into synthetic shapes). The participants then reversed the power relationship, which they explored by allowing the roots to guide their creations, rather than the reverse.

In the three years since its founding, no one has left the group; and, in an interesting nod to the guiding principle of 'holism,' there has never been a meeting in which every member attended. Over time, as the initiator of the group, I have been able to release control and trust in its continued existence. Also, the members have come to take more responsibility for its continuation. However, I am still expected to manage the scheduling and logistical arrangements. Perhaps this also suggests the difficulty in our culture of fostering capacities for collective action. Most recently, the group was invited to present its work in a group show at the national Biennale. In the course of this exhibit, the audience will also be invited to create and interact with the group's work, and in this sense also to become part of it.

7. Conclusion

The aim of this ongoing Action Research project has been to awaken opportunities for interaction, reflection and change within design and design education. The working model that came about in the group was inspired by 'ecological thinking,' an approach that celebrates the uniqueness and visibility of each participant, and at the same time creates a space for dialectical connection. The group activity that I have described had a transformative effect on its members as professionals and teachers, and a surprising outcome was that the methodology of Action Research also became, for the participants, an end unto itself. Following Maturana and Varela (1980), in my analysis the research group exemplifies a case of 'autopoiesis,' i.e., an organ that both creates itself while interacting with and influencing its surroundings. That is, the group does not only discuss issues of environment and sustainability in a detached, intellectual way, but manifests them in the body of the group and the research process itself. This is reflected in the fostering of collegial reciprocity and dialogue in an institution which is typically competitive and individualistic, in collaborations across disciplines, and in reflections on the group's impact at the two-year point since its founding. Transformation was also felt in ecological ripples outside the group, for example via partnerships with the business sector and with NGOs. All these trickled down directly and indirectly into the teaching atmosphere of the institution.

As an applied art, design penetrates every aspect of our everyday lives. Objects, infrastructures, and images are an inseparable part of human existence and it is easy to overlook, as Willis (2006) stated, that "We design our world, while our world acts back on us and designs us." The impacts of design can be catastrophic and obvious, as in environmental and social crises, or they can be more subtle, faintly cementing mental habits and the conditions for human behaviour (Fry, 1999; Lopes, 2017). Calvelli (2009) argued that there is a powerful correlation between how we perceive the history of design, and how we teach design to the next generation. A 'bad ecology' will have as its outcome nothing more than the production of objects. For a 'good ecology' to exist, design schools must encourage dialogical engagement with existential problems and promote more openness of thought (d'Anjou, 2007). The research described here is not supposed to directly resolve the myriad ecological problems and conflicts that face our planet, but it does perceive an urgent need to respond to them by expanding relationships between disciplines and between theory and practice, and sees the tools of art and design as natural leaders in this process.

Abstract | This paper will discuss the role of the designer and the importance of design education and digital resources required in order to find a new vision with regards to the problems created by man himself. Design is at present going through a great change from the linear system towards the circular economy and requires new actions, attitudes and resources when interacting with this change, in addition to harnessing the opportunity to "redesign the world." Sustainability has proven to be a continuous process of learning and adaptation, the present day digital transformation can offer great opportunities for designers to influence with the concept of Green UX, both as a tool to visualize and communicate in a straightforward manner wicked problems and convert major players in the commercial world into future users and promoters of circular design. Research shows that innovative digital platforms can offer alternative teaching methodologies for collective learning.

KEYWORDS | CIRCULAR ECONOMY, CIRCULAR DESIGN, INNOVATIVE DIGITAL PLATFORMS, SUSTAINABLE CONNECTIVITY, COLLECTIVE LEARNING, DIGITAL TRANSFORMATION.

1. Design education and digital resources for an ethical, sustainable and digital transformation

Sustainability has proven to be a continuous process of learning and adaptation, preparation for a new economic model puts the responsibility on and highlights the importance of specific education for a circular economy using new models. This paper will discuss the role of the designer and the importance of design education and digital resources for the ethical, sustainable and digital transformation that is required in order to find a new vision with regards to the problems created by man himself.

Design is at present going through a transition from the linear system towards the circular economy (CE) and requires from the designer new actions, attitudes and resources when interacting with this change. Research to promote a circular and sustainable economy aided by design is underway, such as the research project to identify the tools required by Portuguese companies and designers, in order to overcome barriers and be able to align design projects with European policies (Camocho, Ferreira, & Vicente, 2018).

However, formal design education has fallen behind, the preference of students is changing since they are generations adapted to technology with a greater facility in digital learning, an example being the use of mobile phones in teaching, such as social networking tools and media experiences that have impacted on education and student learning (Tynan, 2011). It is worth noting that these generations (Willian, 2011) show that technologies are changing not only the way of learning and teaching, but also academic structures and practices. Simon McIntyre (2014) comments that teaching is connected with society and work practice, which implies an advance in the use of technologies and in the way of learning and collaborating.

Informal disruptive methods respond better to present day needs, and in particular with regards to complex evolutionary topics required to prepare students for future alternative economic models. Sustainable curricula first appeared in higher education at the turn of the 21st century with the DIS Design and Innovation for Sustainability carried out by Carlos Vezzoli and Ezio Manzini in the design department of the Politecnico di Milano (Vezzoli, 2006). In 2010 the Aalto University's Creative Sustainability masters programme was created with a cross-disciplinary character between the art, design, business and technology faculties. It's focus is related to the Finnish national design plan focused on implementing sustainable design education for a future society (Hyvönen, Saarela, & Mattila, 2014). In past years the situation in design education has not evolved as desired, and in 2020 still only a limited number of institutions fully incorporate CE in their design studies.

Digital resources are advancing at an exponential rate, becoming accessible to all and enabling an acceleration in the dissemination of knowledge, leading to new ways of sharing and collaboration, informal education models have exploited this opportunity providing

contents that are urgently needed addressing, as is the case of sustainability in design education. During this period of recent digital acceleration the concept of User Experience (UX) design has gained prominence as our day to day existence moves online. Here UX design provides the perfect scenario for designers to work with complex topics to simplify the existing excess of data, give users a voice, and allow brands to showcase their sustainability.

An ethical, sustainable and digital transformation can now be achieved and future designers must be prepared to "redesign the world," this in turn will require training and guidance from formal educators "to respond to crises and challenges that humanity faces in the 21st century social innovation needs to be viewed in a systemic and open dimension to achieve long-lasting and positive impact" (Ferreira, Souleles, & Savva, 2020, p.37).

2. Online resources for design teaching of the circular economy

Many online resources for design teaching of this new economical model have emerged in recent years, the following provide quality open source material: the Circular Design Guide (Ellen Macarthur Foundation & IDEO, 2017) is a website for designers with methods, mindsets, stories and resources created by Ellen MacArthur Foundation and IDEO design studio in 2017, and The Circular Classroom (Arcaroglu, 2018) with material for students and educators to start their own CE classroom was launched by Leyla Acaroglu's UnSchool of Disruptive Design in 2018. Both provide guidance for designers and non designers to understand and apply circular methods to lifestyles and work, however both are somewhat behind the times in terms of their resources and UX.

Other online platforms –offering general circular economy contents– with updated material tend to act as repositories accumulating an abundance of data impossible to digest. Three have been studied: the Sustainability Map, the European Circular Economy Stakeholder Platform and the Circular Economy Learning Hub. Each was chosen for promoting CE at a European level, offering different perspectives in accordance with their stakeholders, all providing intrinsically a listing of generic data, standards, regulations, case studies, news and projects, however all are lacking specific material of interest to the designer. It is also unclear the manner in which each receives, regulates and certifies content, making it difficult to trace or evaluate the information to the original source which would enable findings to be applied to the design field, nor do they recognise the potential of design in the circular economy.

The Sustainability Map has various European and American aid and economic entities as sponsors, with a variety of users: producers, processors, buyers, organizations, experts and academia, working to "provide scalable tools, technical assistance and advisory services for every stage of the value chain, from micro, small and medium sized enterprises in developing countries to retailers and brands in developed markets" (International trade

Center) With content on standards, community, network and trends, aimed at enterprises, international buyers, public-sector and academia (generally in the field of environmental economics).

The European Circular Economy Stakeholder Platform (ECESP) is an initiative created by the European Commission and the European Economic and Social Committee (EESC), impulsed as part of the part of 2005 EU Action Plan for the Circular Economy to engage with stakeholders and support the exchange of future good practices. It functions as a "network of networks", it plans to go beyond sectoral activities and highlights cross-sector opportunities, to share and scale up effective solutions and address specific challenges, for example: funding sources, proposing measurement tools or policy guidelines. In 2015 a two year research collaboration with the Ellen MacArthur Foundation and Granta Design resulted in the Circularity Indicators Project, aimed at business, policy makers, academia and consumers it is designed to measure the extent to which the material flows of a product or company are restorative. According to Janine Borg, ECESP platform coordinator and EESC Secretariat, recommendations for improvement have been made to concentrate actions thematically, establish clear timeframes and define purpose, objectives and desired outcomes of these actions, the current structure and content being considered most helpful for those already in the know. Future plans also include greater attention to education in order to guide, not simply check how circular you are but to redirect actions, and support the creation of other platforms at a national level, Italy already has its own platform and Austria is in the process.

The Circular Economy Learning Hub (Ellen MacArthur Foundation, july 28, 2019) is the most useful for the design community, devised by the Ellen MacArthur Foundation who considers that design is the heart of the circular economy. It requires us to redesign everything and enjoys a close relationship with the IDEO global design company. This recently launched learning hub is part of the foundation's ongoing initiative to increase education efforts, with work focusing on six areas: learning; business, institutions, governments and cities; insight and analysis; systemic initiatives; and communications.

3. A profound transformation: we are all designers

We know that designers use their creativity and their way of designing to unite fantasy with invention (Munari, 1997). They also have the ability to solve problems in a variety of ways by associating existing ideas from areas that are initially disparate (Amabile, 2000). According to Manzini, we are all designers (Manzini, 2015). This statement permits us to see the profound transformation that has occurred in the designer's intervention with the world. Capra (2002) talks of creativity, continuous learning, moving and development with basic elements in living systems. Another theory by Capra (2002) suggests that the living systems of nature have the capacity to organize themselves, promoting a new order. However the same does not occur with man-made systems,

these are increasingly more complex, and according to the author, cover all aspects of our lives, whether in the productive model, communication systems, among others, and require a profound change in order to become sustainable.

We live in a context in which even wicked problems (Buchanan, 1992) have become super wicked problems where "time is running out; those who cause the problem also seek to provide a solution; the central authority needed to address it is weak or non-existent; and, partly as a result, policy responses discount the future irrationally" (Levin, Cashore, Bernstein, & Auld, 2012). We know that many agents from all sectors of society are needed, industry, businesses, NGOs, citizens, experts, the state and its laws, which in collaboration can contribute knowledge, creativity and innovation to solve these problems and provide a new order.

The present day digital transformation offers opportunities for designers to influence with the concept of Green UX (Morrissey, 2019), which serves both as a tool to visualize and communicate in a straightforward manner these complex issues designers are now facing and to convert major players in the commercial world (Google, Apple) into future users and promoters of circular design.

One of the keys to solving the problem is connectivity as Capra (2002) already pointed out at the beginning of the 21st century, change will happen through connectivity and communication between various areas of knowledge, because society, according to his findings, maintains a rigorous separability between the areas of knowledge and society. The challenge of our times will be the connectedness of scientists, people, communities, and need to be organized in such a way that they do not impair the ability of nature to sustain life on the planet. Transferring this necessary connectivity to Manzini's theory that we are all designers, allows an understanding of the profound transformation that has occurred in the designer's behaviour.

Connectivity is the key for the new order, in this context an organizational system can be observed with innovative digital resources, collaborative learning and synergic actions, in this scenario the designer is the aggregating element that creates the mechanisms and tools for collaborations and processes to be executed, in addition to being the nucleus of circular design according to the Ellen MacArthur Foundation. Given the current climate emergency, organizations such as education, government, companies, among others, are unable to respond, the most recent example being the environment summit "COP Chile - Madrid 2019" that failed to advance in global agreements. This is unfortunate as other organizational paths, where several agents from different sectors share their knowledge and exchange information and concerns, have more success, an example is the Disruptive Innovation Festival (DIF), which encourages collaborative learning.

The Disruptive Innovation Festival is a digital platform that aims to change the mentality of designers and business in order to inspire action towards a circular economy, a regenerative system in which the flow of resources and waste, emission and energy losses are minimized. An online festival that proposes to identify new ideas by asking: "What if we could redesign everything?" Curated by the Ellen MacArthur Foundation, during a three week period annually where innovative projects are presented and debated in both the professional and academic field.

Informal design education responds better to the present day society's needs as it can be both lean and agile, it enables people to be in contact and implement disruptive methods. Whereas regulated design teaching shows that "… sustainable development is not yet at the top of design curricula. It exists in most cases as an isolated component of something optional, that could be chosen –or not– to integrate into the design idealization and creation phase" (Ferreira, Souleles, & Savva S.,2019). It is important to highlight that academia knows that a change in the way of doing and thinking is needed as is demonstrated with the Sustainable Disruptions Report by the danish Design School Kolding, which has as its motto for change and disruption the Albert Einstein phrase: "We cannot solve our problems with the same thinking we used to create them." (Bohl, 2015, p. 8)

New methods and tools to help designers make circular material choices exist, for example the Circular Design Guide (CDG) created to encourage synergy and collaboration, breaking with the traditional modus operandi, using worksheets and case studies, which make it possible for the work to be fluid, dynamic and creative. Collaboration between universities on the theme, such as the LeNSin (International Learning Network of networks on Sustainability) organized during 2015-18 and developed with Erasmus+ finance includes 36 worldwide universities and offers a platform for the exchange of good practices to contribute to a transition towards a sustainable society, taking into account the different contexts of each region. Both the CDG and LeNSin can be considered examples of information exchange and working methods on society impact.

The Circular Classroom (Arcaroglu,2018), is a collaborative learning project that incorporates the experience of other educational centres and synergic actions by adding specialists from different areas, initiated by the designer Leyla Acaroglu (also sustainability innovator and educator), the government of Finland, other teachers and students. This methodology is used in Finland's high schools to help change linear thinking towards the circular, supporting this transition equipping all with a new way of thinking, necessary design tools and a common language for this to happen. Structured in three modules (sustainability, design systems and creativity) it is an interactive resource platform, offering teaching material, classroom activities, teachers kit based on

communication and design to generate change, a method that activates collaborative and experimental learning.

4. The digital transformation offers great opportunities

The European Commission has updated this year it's 2005 Circular Economy Plan alerting that although the circular economy is here to stay it is far from being implemented globally or to the desired scale, as many stakeholders are still without an action plan (EC, 2019): "The circular economy is now an irreversible, global mega trend. Yet, much is still needed to scale up action at EU level and globally, fully close the loop and reap the competitive advantage it brings to EU businesses. Interaction with stakeholders suggests that areas not covered by the action plan could be investigated to complete the circular agenda" (EC report on the implementation of the Circular Economy Action Plan, 2019).

The importance of specific education for a circular economy using new models, be it disruptive, online, informal, is now a priority for the design sector. Here the potential of UX in relation to environmental issues has derived in the concept of Green UX. This concept is defined as having two aspects; first as a tool, making visible the complexities and problems of the CE, offering a new communication with the daily experiences that affect the management of resources and second in its application, where the fast growing unsustainable digital sector is committed to implementing the principles of a circular economy, adopting a new sustainable and inclusive model.

Optimization of digital resources to create a *design for all* adopting lean or agile style workflows, designing for greater usability, minimizing the use of excessive data by ethically managing servers, without forgetting the high consumption of the screens, wi-fi technology and the effectiveness of the Internet of Things (IoT). Designing for *Mobile-first*, that is, to begin designing for small screens and scale upwards, this method provides greater performance, and guarantees an excellent experience with fast loading websites for users accessing through mobile networks.

There are now many projects implementing Green UX, such as the British government website. It is a perfect example of easy, clear and inclusive usability. Its Head of Design Ben Terrett explains: " 'People come to GOV.UK to do something and then move on with their lives. No one comes to look at graphic design. We believe that the form follows the function and that from this comes a visual elegance.' It is more than just the design of a website; what they designed is the complete digital interaction between citizens and the government, including transactions. All information follows a simple structure, aesthetics is not striking, the design is based solely on typography and at all times allows interaction at various levels (surveys), with the support of AbilityNet for people with specific accessibility needs..." (Hurst, 2013, 17 april)

5. We need to start living the data we possess

The world has suffered too long an excess of factoids that have made it immune to the problems of sustainability, and now the time has come to handle ecological knowledge in a more genuine manner, we need to start living the data we possess (Morton, 2017). At present we are witnessing a public outcry for climate change action, where a schoolgirl from Stockholm –Greta Thunberg– has united thousands of people in over 300 cities in March 2019 on the first ever global climate strike (350.org., 2019, 15 may). In response to critics who encouraged her to abandon her Friday strikes, since 2018, to return to school and become a scientist working towards climate change, she reminds us: “But the climate crisis has already been solved. We already have all the facts and solutions. All we have to do is to wake up and change.” (Thunberg, 2019).

The circular economy and circular design are complex concepts to implement. According to the Ellen MacArthur Foundation “A circular economy is based on the principles of designing out waste and pollution, keeping products and materials in use, and regenerating natural systems.”(Ellen MacArthur Foundation. Concept. What is a circular economy? A framework for an economy that is restorative and regenerative by design) This *circularity* is the basis of many sustainable theories and methods (Cradle to Cradle, laws of ecology, looped economy, regenerative design, industrial ecology, biomimicry, Life Cycle Assessment and Blue Economy) and provides an alternative to existing wasteful linear production and use.

The idea of an economy in loops is not new, first appearing in the European Commission report “The Potential for Substituting Manpower for Energy” (Stahel & Reday, 1982) in 1976, later the concept of a circular economy based on non-linear systems was outlined by the environmental economists David W. Pearce and R. Kerry Turner (1989), and in 2013 the authors of the Cradle to Cradle concept (of special interest to designers) McDonough and Braungart, updated their concept with the publication of “The Upcycle: Beyond Sustainability - Designing for Abundance”(McDonough & Braungart, 2013), proposing that instead of limiting sustainability to protecting the planet from human impact, we have the opportunity to improve the planet by producing beneficial projects.

The CE offers a positive continuous development cycle which preserves and increases natural capital, optimizing the yields of the resources and minimizes the system risks, managing finite stocks and renewable flows, and works effectively at any scale. Design has immense opportunities for action in this field, however it requires its professionals and in particular the new generations of designers first to be aware of the concept, then have in place the data, tools, certifications and methodologies in order to be able to design products and services that are truly circular. And this is where innovative digital platforms offering alternative teaching methodologies will play an important part in

preparing the future generations of designers to overcome the complexity of the issue, to start living the data we already possess and applying it to their projects.

6. In Conclusion

Research to date identifies the need for innovative digital platforms to offer alternative teaching methodologies to educate all together. Here the capacity of the designer to create the tools, methodologies, and teams to visualize the complexities of the circular models will be crucial, but will only occur once more emphasis is placed on educating the designer towards the circular economy.

The digital transformation and the evolution of the Green UX concept is providing valuable support, while the digital sector serves to visualize experiences and implement a sustainable agenda, it is also becoming aware of the potential of CE thus offering the end user a responsible digital product or service, easy to use and designed with total accessibility.

In the new context of CE the designer attains a new protagonist, becoming a key element of the design process it allows for the creation of new tools so that synergies and communication between different parts of society can occur.

The actual complexity and super wicked problems faced result in a change towards a more collaborative and open structure where collective creation uses open source methods as the future for CE education, for example, the Open Education at Creative Commons. Working to eliminate barriers, train and educate using open licenses to offer an Open Education.

Initiatives of collaborative networks between universities like LeNSin, government policies of applying the CE to classrooms like the Danish use of the Circular Classroom platform, uniting faculties for cross-disciplinary actions like the Aalto's Creative Sustainability Masters or the recent launch of the Circular Economy Learning Hub are positive actions for education to prepare future generations of designers. By using the digital resources available and thus put the circular economy in action, making the most of a designer's capacity to create tools and resources to visualise the complex issue, to catalogue and preserve correctly the knowledge obtained from the experience of each project, offering up to date insights and leading the much needed multi-disciplinary teams.

*joselyn.sim@lasalle.edu.sg

Abstract | Singapore, having received the status of a "Creative City of Design" by UNESCO, has identified creativity as a key strategy for social and cultural development. Traditional perceptions of Singapore as a conservative island nation are changing, as industry sectors embrace design-led processes of planning and implementation to produce and facilitate new innovations in cultural production. This paper discusses the importance of design education to adapt to the changing environment and equip students with more holistic approaches to design. The research considers the growing impact of design citizenry through community engagement and the underlying philosophies supporting the design of future markets, against the rapidly changing context of Singapore. This study presents a 3-week long, immersive workshop for final year design research students. Through documentation of the workshop delivery and reflective journals of students, the piloting of a "Markets" track of research is analysed and discussed to define the ability of future designers to influence cultures of change through new approaches to address the macro and microeconomic shifts framing design practice. This paper examines how the potential of design impact can be measured, evaluated and scaled through flexible curriculum design in design education.

KEYWORDS | DESIGN EDUCATION, DESIGN PEDAGOGY, CURRICULUM DESIGN, INNOVATIVE LEARNING

1. Introduction

Digital disruption is not only changing the landscape of businesses and the workforce but pushing learning and teaching approaches to re-evaluate how educators motivate new modes of learning in a digital world. This confronts design education with challenges to restructure and redefine the role of future designers to establish deeper understandings of customer experience and more meaningful engagements with communities to support design impact. One key area facing significant change is the space of markets. As citizens contribute to new sharing and circular modes of production, dissemination and use, traditional notions of the market are being replaced with new conceptions and ideas of social, economic and sustainable design practice.

In tertiary education, educators are working towards preparing learners with emerging 21st-century competencies. Singapore's Ministry of Education produced a framework that lists Global Awareness, Cross-Cultural Skills, and Critical and Inventive Thinking as competencies that will enable youth to find new opportunities within the digital age (Ministry of Education). Against the design education landscape, there is a push towards infusing a wider appreciation of design in curricula within the institutes of higher learning to meet changing job scopes and rising demands for design skills (Ang, 2019).

This paper provides an overview of the higher education landscape of Singapore and presents a bottom-up curriculum design that addresses the alignment of pedagogical approaches that respond to the needs of the environment. The testing of a pilot study is presented, discussed and analysed to propose a mapping of curriculum design that considers agility and flexibility for learning and teaching. This paper concludes with the identification of design literacies that equip students with broader competencies while enabling programmes to continually evolve and adjust to the changing needs of the macro-environment.

2. Preparing 21st-Century Leaders and Change-Makers

The 2025 design masterplan vision for Singapore sets out to develop a thriving, innovation-driven economy that is strengthened by design through higher education strategies and design-led, creative thinking skills (Design Singapore Council, 2019). While these plans will contribute to the growth of the economy, knowledge building activities and exposure to design disciplines is crucial. Design-led thinking within interdisciplinary environments, where collaboration occurs, would allow students to integrate and transfer knowledge across various design disciplines and methods to operate in non-design contexts.

Design should establish itself as a discipline that engages through experience-making, builds with business strategies, and integrates user experience. However, the term "*design*" has taken on a new meaning with less emphasis on how things look and more on how things should work (Ang, 2019). As disciplines like engineering, business and media begin to

provide more opportunities for those with design-led skills, the value of design produces significance through ways of thinking, processing, and innovating ideas for effective solutions. Across the disciplines, collaborations involving designers are increasingly in demand as government bodies, NGOs and local communities enlist designers to develop creative strategies. This further emphasises the need for design education to adapt and embrace the changing demands of the market.

The design curriculum needs to evolve and develop changes that meet the expectations of students, which are demonstrated by the 21st Century competencies of adaptive learning, critical thinking and digital experience. According to Ang (2020), education systems need to acknowledge the impact of digital influence and equip students with skills and values to navigate the digital world. This enables them to not only take part in a technologically connected world but build resilience against the uncertain and unpredictable future of the job market. It is important for design education to acknowledge the convergence between social media and lifelong learning skills, which act as a conduit for new cultures of learning and knowledge production.

Papanek (1985) stated that designers should "design for people's needs rather than their wants" (p. 219), reinforcing the responsibility of designers in influencing markets and assuming agency over all activities in the creation of meaningful experiences. Design develops significance when its research and solutions extend beyond singular issues and consider the systemic complexities where design skills produce value through innovative solutions. This signifies the demand for design education to address human-centric perspectives to frame the interrelatedness and interdisciplinary nature of design problems, developing transferable skills through critical thinking, idea scaling and evaluation, and systemic approaches to design.

3. Case-Study: Immersive Workshop

Digital transformation influences various industries through changes in how businesses function, create, and thrive against competition. These changes affect students and the culture of research, evidenced through growing interests in topical issues concerning social media, social responsibility, and the geography of design. In order to address the broad knowledge needed to facilitate the expanding design interests of students in the School of Design Communication at LASALLE College of the Arts, three research pathways were created to support practical applications through the designing of experiences, objects or systems:

- **CULTURE:** focuses on the value of design research through the perspectives of sociology and cultural anthropology.
- **MARKETS:** emphasises the relationship between consumers and economies in driving design as an important discipline and profession.

- **TECHNE:** rooted in the study of material culture to link the historical development of graphic art to contemporary studies in visual communication and communication design.

The "Markets" track categorises broad media, marketing, and communication research. As traditional notions of the market are being replaced with new conceptions and ideas of social, economic and sustainable design practice, there is a growing need to create more effective social services through inclusive design methods to innovate and respond to external challenges. To introduce the research track to final year Design Communication students, a 3-week immersive workshop was developed to communicate core research methods, explore the various skill sets informed through research, and produce practical outcomes through a creative design process.

3.1 Piloting of the Workshop

Influenced by macro-level changes, resulting in social and cultural shifts, inform the design activities of the current student population of "Generation Z" who are highly entrepreneurial, innovative, socially aware and undeniably political (Mootee & Smith, 2017: 11). Responding directly to the profiling of this new generation of designers, the immersive workshop challenged students to define how businesses, economies, and design innovation function against the landscape of digital content and marketing, service design, and experience design. The three weeks of the workshop comprised the following:

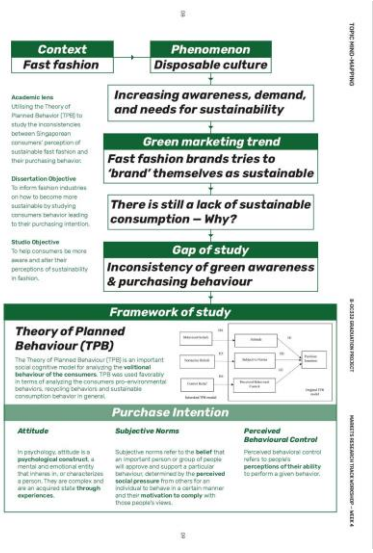
1. **Introduction to Markets**: Students were challenged to develop curiosity about the world and how design can be applied through creativity, problem-solving, social processes, and learning experiences. Acknowledging the marketplace as a system of institutions, within which procedures are developed in the exchange of goods and services between people and organisations, broad definitions of markets were explored in relation to how culture links economies to politics and governing policies.
2. **The Digital World**: Introduced key concepts such as the function of social media, role of digital marketing and digital objects, and utilising artificial intelligence and technology in the creative industries. This session focused on aligning student research to an awareness for building tools of production.
3. **The World of Experiences**: Presented how to create meaningful experiences for people through user experience and interface design, service design, and human-centred design. The definition of experience was broadly discussed with a focus on users to engage in the creative processes of design improvements, innovations and speculations for daily life.

The immersive workshop was documented through a reflective journal that recorded the activities involved in producing outcomes throughout the creative process. Although critiques and peer evaluations engage learners with new abilities to assess and formulate critical feedback (Davis, 2017), the reflective journal allows for self-assessment to inform

individual research and practice. Table 1 presents the timeline of activities and methods of learning. These insights were summarised from the reflective journals of students, leading to the identification of effective teaching tools, methods and approaches.

Table 1. Insights on Workshop Delivery

REFLECTIVE JOURNAL INSIGHTS		
Timeline (Stages)	Methods of Learning	Approaches toward Change
WORKSHOP 1 Introduction to Markets Design Road Mapping - Design research methods - In-class assignment	Designerly way of Knowing: The designerly way of knowing is not only embodied in the process of designing but, equally, the products of design carry knowledge. (Cross, 2007) Triangulation: Triangulation is the means by which an alternate perspective is used to validate, challenge or extend existing findings. (Turner and Turner, 2009)	• Moving away from the comfort zone • Realisation of what needs to be done to speed up work progress • Other topical discussions of concepts indirectly affecting or impacting economy, business and innovation developments
WORKSHOP 2 The Digital World Content Generation - Content planning method - Group critique	Critical Thinking: The three main stages of critical thinking for designers: Observe, Question, and Answer. (Elmansy, 2017) Feedforward: Feedforward consists of providing future-oriented options or solutions. It asks, 'What further improvements need to be made to advance my progress?' (Hattie & Timperley, 2007)	• The event of realisation is a creative leap - creativity as the occurrence of a significant event in the design process. (Dorst & Cross, 2001) • Students indicated how a sudden insight, which most recognised as a learning event, was significant to the process.



Workshop 3 The World of Experiences Digital Design Experience - User experience - Group critique	Small-Group Critiques: "…under this strategy, students talk about work in greater depth and are more critical than in the public settings of a full class critique." (Davis 2017: 136)	• Building different perspectives of design responsibilities and how that might engage design through communication. • Heller notes what the late Milton Glaser expressed, "The key is to ask questions, for the answers will result in responsible decisions. Without responsibility, talent is too easily wasted on waste" (Vienne and Heller, 2003), as why designers must produce honest design that acknowledges the truth rather than manipulates intended audiences with false impressions.

3.2 Holistic Approaches to Teaching

Curriculum design requires an understanding of the needs and expectations of learning within a given cohort. This requires teaching activities that develop opportunities through empathy to produce dialogue, as the '"ability to empathise changes not only how we see and respond to people but also how they respond to and see us…" (Jiwa, 2017: 93). Empathy, in design, is a quality with which practitioners can access the needs, wants and values of users. In that same sense, educators should adopt holistic perspectives through empathy to identify the intellectual, emotional, social and creative potential of students. This directly influences the research topics and themes of student research, which consider the role of design in changing cultures of production and consumption through growing awareness of designing for social awareness and sustainable practice.

Table 2. Selected Outcomes

SELECTED OUTCOMES OF THE "MARKETS" RESEARCH TRACK		
Student Name	Designed outcome:	Synopsis of work

Janice Yap	 A3 poster	**A3 Poster:** The study of Singaporean fashion consumers' green awareness and purchasing behaviour - utilising the theory of planned behaviour to study the inconsistencies between the perception of sustainable fast fashion and purchasing behaviour.
Aretha Cheong	 IG Page	**Social Media - Instagram Page:** The Culture of Erroneous Identity: A study on consumer culture and its impact on the psychological development of self in Singaporean children aged 6-1.4 The Instagram page, *"Kumonforfeelings*" was created to raise awareness on authentic forms of emotional security. Primarily targeted towards parents to educate them on the dangers of consumerism in children, followed by raising the awareness of emotional stability and security, and how it can be carried out to best support their kids emotionally to reduce the risk of relying on consumer culture.

Joshua Yeo	 Editorial Design	**A3 Publication:** A study of 'greenwashing' in Corporate Social Responsibility (CSR and how Food and Beverage brands can engage the Singaporean Cosmopolitan Millennial Consumer by addressing the ageing workforce through brand messaging. The publication features a study of the current forms of CSR in the different industries through a visual study to properly understand the trend of old forms of CSR as a trend.

Design education trains future designers to develop cultural and social sensitivity and responsibility. The resulting outcomes of the 3-week immersive workshop demonstrate the key issues, research themes and design articulations are presented in Table 2. Each of the 3 projects presented above demonstrates a clear application of the immersive workshop by questioning the current market practices, speculating towards design-led futures, and proposing feasible strategies by translating theory through research. The projects present evidence of students developing the ability to tackle large and complex systemic issues through design-led research and creative practice.

4. A Mapping of Future Research in Design Communication

Effective education requires the cultivation of enthusiastic learning, which considers students experience by providing a diverse curriculum that supports methods of teaching and assessment to motivate learning (Robinson, 2016: 231). The key characteristics of a

design communicator comprise awareness and the ability to rethink societal changes and developments. Brock & Hundley (2016: 147) state that the learning process is dynamic and should value mistakes and setbacks to cultivate growth and development. As designers are positioned against complex and problematic situations, intuitive and reflective practices are instrumental to dealing with uncertainties (Schon, 1983).

The piloting of the research tracks provided key insights into the types of topics and research areas that interest current students, indicating the trends for future research tracks and pillars to consider as sources of knowledge production. Markets, as a research area containing relationships between producers and consumers, frames all design activities as it considers the roles of culture and society in the creation of design outcomes. The key terms, insights, themes and concepts from the 3-week immersive workshop were compiled and reorganised to produce a mapping of future areas for student research in the field of Design Communication.

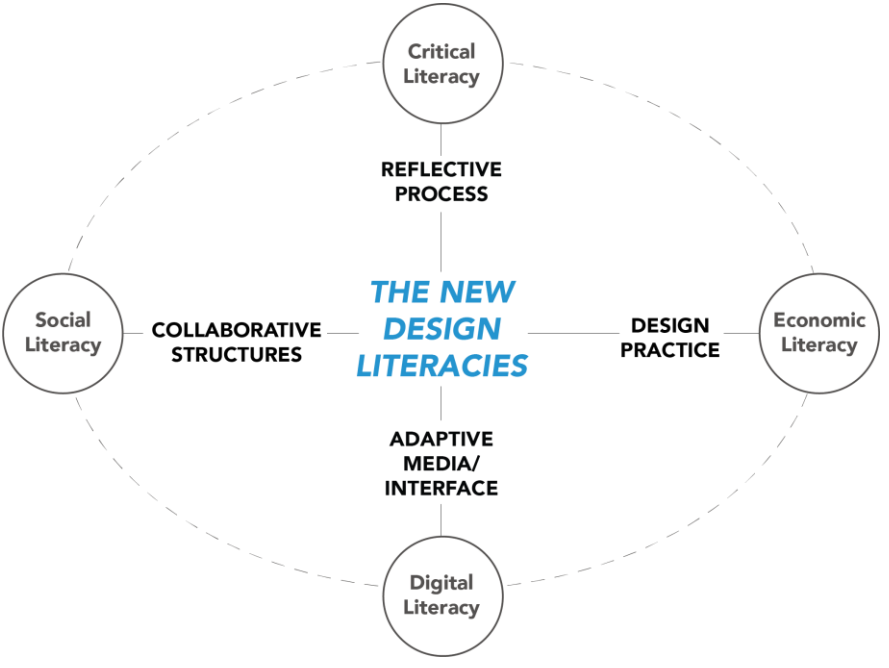


Figure 1. Design Literacies through Flexible Curriculum Design

The mapping of design literacies in Figure 1 outlines how the piloting of the immersive workshop, within the research stream of "Markets", has led to the identification of 4 new literacies for students in the School of Design Communication. The 3 stages of the workshop were developed in direct response to the macro-level changes to the industries requiring specific design skills and activities were organised to expose students to experience through

media, development through critical processes, knowledge production through collaborations, and tangible outcomes through design practice.

THE NEW DESIGN LITERACIES		
ACTIVITY	MODE OF DELIVERY	LITERACY/COMPETENCY
ADAPTIVE MEDIA & INTERFACE	*Experience & integration of communication tools*	DIGITAL LITERACY as a key ability for designers to gather, organise and present information through various forms of technology
REFLECTIVE PRACTICE	*Design development through thinking & writing*	CRITICAL LITERACY is necessary for designers to analyse and evaluate the sociocultural dimensions of design
COLLABORATIVE STRUCTURES	*Group critiques & design evaluation*	SOCIAL LITERACY is the ability of designers to translate social interactions into processes of knowledge exchange
DESIGN PRACTICE	*Translation of research into practical outcomes*	ECONOMIC LITERACY defines the role and function of designers and design activities to produce value

Figure 3. Identification of Design Literacies

As the systems of the world become increasingly complex, it is important for design education to identify clear competencies and skills for future designers to produce impact through the design practice. Digital literacy enables designers to navigate through rapid changes in technology, media channels and interfaces to generate new forms and methods of communication design. Critical literacy positions designers against the broader dimensions of social, cultural, political, ecological and economical changes in the external world, requiring designers to adopt critical perspectives that inform all future actions. Social literacy acknowledges the privileged position of designers to effect impactful change through collaboration, generating robust knowledge through the levels of social interaction and exchange. Economic literacy, within the context of “Markets”, challenges designers to measure, scale and evaluate how design outcomes and skills can produce new currency and value.

Table 3 presents how the workshop has produced a pedagogical framework that informs new literacies and future areas for design research within the programme. Through the introduction of an immersive workshop, students were exposed to new ways of thinking and learning to effectively produce design outcomes addressing the challenges and complexities of the macroenvironment. Equipping students with new design literacies prepares them with a more comprehensive knowledge base that can be transferred across different disciplines, contexts and applications.

5. Conclusion

The piloting of a 3-week immersive workshop demonstrated that cultivating research as part of design education relies on flexible and adaptable approaches to develop an inclusive curriculum. Teaching activities need to present direct connections between key theories and design methodologies for effective student learning experiences. As design competencies continue to evolve and develop, design education needs to quickly adapt to the changing needs of the institutions, industries and markets governing design practice. This paper has demonstrated that developing design literacy, through practical applications, produces new transferrable skills that engage students in the forms of self-directed learning, active engagement, planning and critical awareness for utilising and transforming design towards new innovations.

Design literacies change and evolve in relation to the shifting forces of the environment, requiring design education to develop agility and quickly respond through pedagogical interventions. The case-study discussed in this paper provides an example of how curricular activities and programme structures can integrate different approaches to foster more dynamic studio culture through learning. This enables the design curriculum to maintain relevance and resilience to inform future research areas and contribute to the knowledge base of design.

Fashion Futuring. Rethinking sustainable fashion design.

Alessandra Vaccari*[a], Ilaria Vanni[b],

[a] Università Iuav di Venezia
[b] University of Technology Sydney
* avaccari@iuav.it

Abstract | The paper investigates the possibility to re-imagine fashion design in a sustainable direction and to conceive alternatives to the current unsustainable growth of which fashion has been a carrier in recent decades. The paper relies on the emerging design-theory-based concept of "futuring", which concerns ecology, sustainability, and social innovation. It sets a methodological framework that develops eco-fashion beyond environmental sustainability, and slow fashion beyond the critique of the acceleration of fashion production and consumption. The proposed framework leads into the four directives of Do it Yourself; Future Artisans; Digital Manufacturing; and Industrial Experimentation and allows to encompass initiatives ranging from circular economies to participatory design models and open design. Future research on Italian case studies will test the validity of this framework. The research hypothesis is that there is an Italian design laboratory in fashion, able to prefigure new material cultures and shape the ways we live and interact.

KEYWORDS | FASHION DESIGN, LABORATORY ITALY, FUTURING, ECOLOGY, SUSTAINABILITY

1. Introduction

A *merceria* (haberdashery) in Siena has re-imagined its function and extended its work to co-design accessories with its clients. People can choose patterns, fabrics, trimmings and have a personalised bag, basket, headscarf, t-shirt handmade in no time. A tailor learned his trade from the family business in Sicily. At one point, he decides to experiment with different ways of patternmaking, attends training at a makerspace, and starts using open-source software that allows him to create patterns using parametric designs. In Trentino Alto Adige, a group of young engineers has asked what to do with the leftovers from winemaking. The answer is a design process that recycles grape skins and stalks into a new textile. Meanwhile, in Piemonte, an almost 200 years old manufacturer produces high-quality yarns sold to designers for the luxury market. These four vignettes introduce this paper's theme: which are the main directions emerging in fashion and textile design in Italy in relation to sustainability? We present here the ideas that prompted our research, which is still at its initial stages.

It is believed that fashion does not have moral obligations toward the future. However, the seduction of bio textiles, the zero waste lifecycle and the use of new technologies in the garment industry are just some examples of the forward-looking agenda of 21st-century fashion. Nowadays, the association between fashion and a sustainable future is acquiring more relevance and communicative strength. In 2019, the French fashion designer Marine Serre defined her designs as "Future wear", combining techno-sportswear styles and environmental concerns in an "Eco futuristic" line made of end-of-cycle products. In 2015 the United Nations established seventeen Sustainable Development Goals (SDGs) under the title of *Transforming our world: the 2030 Agenda for Sustainable Development*. The SDGs' 169 targets address a wide range of issues related to sustainability and economic security. Following this agenda, the international non-profit association Forum for the Future and the Centre for Sustainable Fashion (London College of Fashion) have published *Fashion Futures 2030*, a global scenario for sustainable fashion conceived to help industries and people "to think differently about the future for fashion" (William et al., n.d.).

Students and climate activists organised the campaign Friday for Future which became a global movement in 2019. The slogan "no future" has been adopted by the global environmental movement Extinction Rebellion to warn about the un-sustainability of the present ways of living. Through the campaign #BoycottFashion, the movement has asked supporters not to buy new clothes for a year and repair and up-cycle, share and swap, rescue and repurpose clothes, and establish a new ecologically friendly relationship with them. In the context of a growing demand for a better future and increasing anxiety for the future generations, fashion should play a crucial role in encouraging a critical change, stimulating radical visions and pervasive action, from large-scale industrial systems to individual experiences. Finally, in the field of fashion studies, the discussions about the end of fashion as a broken system have inevitably raised a parallel debate on its future, involving the redefinition of fashion itself (Steele 2019).

In opposition to the dystopian visions of unsustainable growth of which fast fashion has been a carrier in recent decades (Payne, 2019), this paper outlines possible research directions. It presents a methodological framework articulated along two axes: 1) short-long supply chain and 2) handmade and techno-oriented. These two axes create four areas: Do It Yourself, Future Artisans (*Futuro artigiano*), Digital Manufacturing, and Industrial Experimentation.

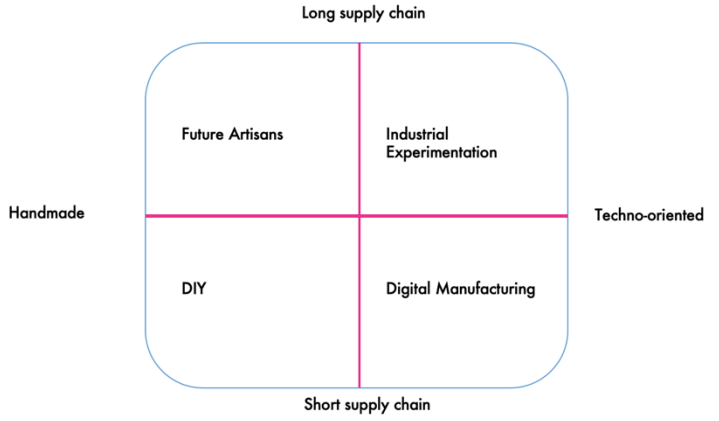

Figure 1. Fashion futuring methodological framework.

Future research on Italian case studies will test the validity of this framework. The research hypothesis is that an Italian design laboratory in fashion can prefigure new material cultures. In the next two sections, we provide the context of this design laboratory's experimental and prefigurative character, outlining the main points in two intersecting debates: one on fashion futuring and the other on "laboratory Italy" (Hardt, 1996).

2. Fashion Futuring and Sustainability Debate

The concept of design futuring stems from the work of design theorist Tony Fry, who has argued for the need for new directions (redirecting) in design to respond to a world that has become unsustainable. Re-directive practices facilitate knowledge exchange; politically contest the unsustainable status quo; promote the transformation of knowledge into action; and shape communities of change working towards a common goal. Importantly, as Fry emphasized, re-directive practices break away from established ways of thinking, working

and making, and producing new designed objects and new design cultures, practices, and designers (Fry 2009, 2014).

"Futuring" is becoming an essential concept in fashion, thanks to the sustainability scholar (Alice Payne, 2019). Payne understands futuring as a dynamic process able to negotiate between two opposing interpretations of sustainability. The first interpretation sees futuring an optimistic and gradual technological evolution towards a cleaner industry. The second endorses a more prudent approach to freeing fashion from the imperative of unsustainable growth of capitalism.

The concept of fashion futuring allows overcoming the exclusivity of some of the proposed sustainable solutions to fashion. These positions include, for instance, "eco-fashion" beyond environmental sustainability (Scaturro, 2008; Brown, 2010); "slow fashion" as a critique of the acceleration of fashion production and consumption (Fletcher 2007, 2010; Clark 2008); and the ancient Greek philosophical concept of "beautiful and good" (Frisa & Ricchetti 2011), which combines ethics and aesthetics. These approaches reaffirm fashion as an elitist concept that exclusively entails the linkage between slow and expensive, innovation and luxury. On the contrary, fashion futuring is a new approach to the debate on sustainable fashion that emphasises initiatives ranging from the creation of circular economies (Smith, Baille & McHattie 2017) to participatory design models (Hirscher, Fuad-Luke 2013) and open design (Romano 2015). All these initiatives have in common the quest for a more holistic approach to fashion design, manufacture, and consumption. For instance, it entails DIY practices and innovation supported by the free circulation of ideas and skills.

3. Fashion Futuring the "Laboratory Italy"

Italy represents an interesting case study because big brands, emerging designers and a plurality of artisans coexist in its territory. Each has its narrative, stressing respectively, marketing, creativity, and manual work's intellectual character (d'Ovidio, 2015). Together, these dimensions show how fashion in Italy is a multifaceted and a complex phenomenon, defined by positive tensions between traditional techniques and new technologies.

This research project is part of a network of studies investigating fashion in an interdisciplinary key and its complex relationships with capitalism’s history. The project moves from the idea of "Laboratory Italy" as theorised by Michael Hardt as a political experimentation model in which theory and practice go hand in hand. In Hardt's words:

"The relationship between theory and practice remains an open problematic, a kind of laboratory for testing the effects of new ideas, strategies, and organisations. Revolution can be nothing other than this continually open process of experimentation." (Hardt, 1996, p.2)

In recent years, "Laboratory Italy" has gained new momentum and new meaning. A new momentum, because it has been seen as a paradigmatic concept to rethink Made in Italy as a “cultural counter-hegemony in an international market dominated by the United States”

(Balicco, 2018, p. 39). A new meaning, because it has been expanded from political philosophy to the rich cultural pluralism of Italian design, and tested in the fields of fashion, architecture, and visual and performative arts (Bolgherini, et al., 2018).

The research thus adopts an approach that combines the two theoretical debates around "Futuring fashion" and "Laboratory Italy", to identify, map and analyse emerging re-directive and experimental practices in the field of design, production and communication of fashion in Italy. A result is a theoretical tool for investigating new areas of contact between creative practices in the field of fashion and forms of activism (Vanni, 2020).

We identified futuring practices and Italian laboratory in fashion in the intersections of the following four directives: Do it Yourself; future artisans, digital manufacturing, and industrial experimentation.

4. Fashion futuring: a methodological framework

This section expands the methodological framework we outlined in our introduction. This framework is a mapping instrument built in two dimensions: the practice and knowledge axis, that moves from the handmade to the techno-oriented, and the production and distribution axis, that moves from short to long supply chain. These two directions intersect to form four quadrants, and each of these quadrants includes design practices, theory, and artefacts. This framework is a methodological tool to think through emerging design practices that we will map in the next stage of our research. As it often happens when methodological frameworks are tested in fieldwork, the framework itself may change.

4.1 Do It Yourself (short supply chain + handmade)

The 2000s has seen the revival of self-production practices in clothing, from knitwear circles to cutting and sewing courses. These practices point to the desire to escape classic production and consumption mechanisms and re-evaluate individual creative abilities. Feminist perspectives recovered knitting, crochet, embroidery, and other domestic crafts as examples of creativity and unpaid female labour (Greer, 2013; Hackney, 2013: Rosner, 1018). More recently these crafts have expanded through the use of web 2.0 (Gauntlett, 2011), for examples with websites dedicated to particular techniques, with platforms that enable short supply chains (Etsy) and with visual social media (Pinterest and Instagram).

Handmade, craft and DIY are labels that often recover creative, minorities practices, following feminist studies on the politics of making activities and the historical omissions of women's crafts (Parker & Pollock, 1981; Greer, 2013; Hackney, 2013). As signs of personal creativity, these DIY practices mobilise an imaginary of individuality, economic resilience, reinvention of traditions, a more democratic fashion and forms of "quiet activism" (Hackney, 2013). DIY also appeals to an appetite for new frugality (von Busch, 2014). Finally, making or buying from makers are also acts of micro resistance and material disobedience to the many

ethical and environmental issues surrounding fast fashion. Artisanal and handmade products appeal to a quest for authenticity, uniqueness and added value against the ubiquity of fast and high street fashion (Micelli, 2011). With regard to Italy, a case in point taken into consideration during the initial stage of the research is Talking Hands, a permanent workshop of fashion design and social innovation established in Treviso in 2016. It involves migrant workers from developing countries and adopts manual activity as a form of narration of their lives and dreams (Franzo, 2020).

4.2 Future artisans (long supply chain + handmade)

Futuro artigiano is the title of the book (2011) by Stefano Micelli dedicated to hand made artisan cultures and practices, which the author places at the centre of the concept of Made in Italy. Micelli maintains that it is precisely the skills of "knowing how to make artisans" (Sennett 2008), both in small and large companies, that make Italian manufacturing attractive at a global level. Handmade becomes a meeting point between local and global. An example is how small fashion independent brands as Ijo' Design, funded in 2001 by Annalisa Surace, have revived the Apulian traditional weaving on olive wood looms. It has gained an international profile and has been selling its designs through The Lobby, an experimental concept retail born in 2018 in Stockholm to offer short contracts to niche brands, providing them with small in-store spaces for the presentation of their collections to the public and the buyers. Another enlightening example is the Italian textile company Bonotto, which has contributed to promote the “slow factory” model against industrial standardisation and low-cost mass production. As the company website explains, in the Bonotto firm, industrial production processes "are entrusted to mechanical machines with no automation rather than to electronic machines. Old, discarded, and neglected looms, precisely because they are 'slow'" (Bonotto 2020).

4.3 Digital manufacturing (short supply chain + techno-oriented)

The advent of a new culture of making (maker culture) coincides with the desire to re-imagine production and consumption in the direction of sustainable futures, and the capacity to blur distinctions between producer and consumer. The spread of digital technologies such as laser cutters associated with open source software has generated new ways of thinking fashion design and new design processes. In the field of fashion, digital manufacturing is not limited to the production of new objects. Instead, digital manufacturing includes the reinvention of a 0 km fashion chain and the creation of new designers capable of integrating artisan know-how with digital knowledge. It also includes the invention of new technology or the hacking of existing tools. For example, the Milanese makerspace We Make runs Digital Fashion training programs that use open source technologies and remixes specific fashion design with digital technology knowledge and practices. For instance, pattern making draws both on 'traditional' fashion design methods and the possibilities of parametric patternmaking software (Seamly2) that enables the designer to change specific parameters to alter sizes without producing new patterns for each different size. Similarly,

1980s knitting machines have been updated with a shield and an Arduino microcontroller, used in combination with open-source graphic software to produce innovative patterns (Vanni, 2020). Files with patterns, designs and hacks can be circulated online and made locally (in maker spaces, or other spaces equipped with technologies), and artefacts can be sold through online platforms, such as Etsy. In 2020, the digital manufacturing has shown its potential to transform the fashion industry, overcoming some of the limitations imposed by the anti-Covid-19 measures. To date, the research has explored the four Italian cases of Inversion; Sense – Immaterial Reality; IL3X and Barbara Bologna (Vaccari, Franzo & Tonucci, 2020).

4.4 Industrial experimentation (long supply chain + techno-oriented)

Sustainability has acquired central importance at an environmental, socio-cultural and economic level. The logic of 'Reduce, Reuse, and Recycle' informs a rich pool of experiments. This is the case of the invention of new fabrics made of living materials such as mushrooms (Mycotex by Neffa), or waste milk (QMilk), algae (Algae Apparel), and agricultural residues (Crop à Porter). The latter is mainly developed in Italy, where the local agri-food production has plenty of raw materials to experiment with and to sustain a circular economy based on waste transformation. Orange Fiber is a Sicilian company that turns citrus peels into textiles. The apple skin leather Frumat and the wine waste leather Vegea are manufactured by other two Italian companies specialised in vegan and eco-friendly materials. The initial phase of our research has highlighted how these sustainable and innovative examples (Franzo, Vaccari, Vanni & forthcoming) can contribute to radically transform the textile and leather industries, which in the 20th century have been the cornerstones of the Made in Italy.

5. Discussion

Fashion futuring theoretical framework intends to highlight new areas of contact between fashion design and forms of activism; traditional craft skills and technological innovation culture; and small scale high-quality productions and digital manufacturing. Also, it aims to contribute to rethinking the cultural, environmental and socio-economic implications of the role of the fashion designer, from their working conditions to their weltanschauung (Vaccari, 2012). Building on "Laboratory Italy", this research intends to overcome the traditional interpretation of Italian fashion inherited by the late 20th century and built upon the opposition between the mass politicisation of Italian culture in the 1960s and 1970s and the hedonism of the 1980s and the following decades, epitomised by fashion. The research highlights the role that Italian fashion could play in the 21st century when fashion and fashion design can contribute to generating forms of resistance and resilience to global climate change.

The research combines fashion studies, design theory, historical research, field research, and qualitative analysis on the methodological level. On a territorial and national scale, this

research relates to independent fashion designers, start-ups, small and medium enterprises, sustainability departments of luxury groups, independent fairs dedicated to craft and sustainable fashion such as Venice Fashion Week, international associations such as Fashion Revolution and the Fab-Lab network.

This research has the main theoretical objective of conceptualising an Italian theory of fashion and study the new material cultures generated by fashion futuring. The research also aims to support sustainable futures, helping to face the current climate and environmental emergency through disseminating and enhancing practices aimed at redirecting fashion design as a product and re-imagining it both at an individual level and as a collaborative practice.

Conclusion

Fashion for the future is an emerging theme, able to catch the interest of global brands, small-medium scale firms, and independent designers. The fashion futuring research project is part of a network of studies that investigates fashion in an interdisciplinary key and in its complex relationships with the history of capitalism on the one hand, and, on the other hand, the literature on sustainability. This preliminary study has identified "futuring" practices in fashion design in the intersections of four directives: Do it Yourself; Future artisans; Digital manufacturing; and Industrial experimentation. This framework could help to enhance the understanding of fashion sustainability, by offering a tool for mapping it and putting in relation the broad spectrum of experiments found in Italy today.

FASHIONABLE FAÇADE: textile waste innovations for the built environment.

Hilde Heim[a],

[a]Queensland University of Technology
*hilde.heim@qut.edu.au

Abstract | A groundswell of designers, small-scale entrepreneurs and consumers are redefining waste - seeing it as a resource and imprinting new marks on our lived cultures by turning to circular supply systems. This paper investigates regenerated materials made from textile waste for use as 'new' products in the built environment. The study finds that while innovations from waste-based products are growing rapidly, their adoption seems obstructed behind walls of limited communication and economic risk aversion. The promising news is that some small and micro factories are taking on the challenge of commercialising new innovations - and succeeding. Designers are building value through the adoption of regenerated products within the larger creative economy. However, even this apparently more sustainable route has its pitfalls. Through an exploratory approach, this study illuminates some of the steps still required for systems change towards full circularity in the production and adoption of textile waste as a resource for the built environment.

KEYWORDS | TEXTILE WASTE, CIRCULAR ECONOMY, RECYCLED BUILDING PRODUCTS, MICRO-FACTORIES, DIFFUSION OF INNOVATIONS

1. Introduction

Consumers were shocked to hear that common practice among fashion brands is to regularly incinerate deadstock (unsold garments) (Lieber, 2018). Burning is one of several textile waste management strategies implemented in the absence of viable recycling schemes (Malinauskaite et al., 2017). Yet the application of effective recycling schemes has become an imperative as global textile waste is a significant social, economic and environmental issue amounting to around 100 million tonnes of garments disposed of per year (Redress, 2017). Approximately 25% of textile waste is recycled in the second-hand clothing market but as little as 1% is currently regenerated into new materials (Morlet et al., 2017). This leaves around 75% degenerating in landfill or releasing toxic chemicals via incineration (Wang, 2006). Little of the 1% of recovered materials are respun into yarn for garments, instead they are processed into nonwovens (Tonevitskaya, 2019), destined for markets other than the textile industry. These fibres are channelled into the automotive, aerospace and marine fit-out industries, cleaning, paper, bedding, defence, roadworks and building materials. Still an escalation in the recovery and recycling of materials is essential to circumvent needless land fill and reduce the strain on finite natural resources, in order to ultimately balance environmental and social impacts (Amaral et al., 2018).

Calls to shift from a linear supply chain to a closed loop model are echoing through the design industries in increasing intensity (Gwilt, 2012; Kortmann & Piller, 2016). The circular economy model means virgin resources are processed into materials for products that can be recycled and regenerated (ideally) indefinitely (WornAgain, 2020). In this model, products are designed in such a way that they last longer in the first place. For example, by designing for disassembly, garments can be recycled at the end of each use phase (Goldsworthy, 2014). This represents the 'high value' end of the waste spectrum. Other examples of valuable recycling include polyester reprocessing for yarns to make runners (NilkeInnovation, 2020), cotton reduced with enzymes, re-spun and blended with virgin fibres for strength to make new fabrics (Soper, 2019), and pre-production cotton off-cuts reprocessed for wadding. However, at some point, the fibres become too unstable or contaminated for use in textile products and move to a 'lower value' middle phase. It is at this point that fibres can be used as composites for building materials such as bricks (Binici, Gemci, Aksogan, & Kaplan, 2010; Rubino, Liuzzi, Martellotta, & Stefanizzi, 2018), concrete slabs, screeds and renders (Topsfield, 2018; TPM, 2019), surface coverings, sheeting, and insulation. The final phase is incineration – where some claim that this is still a recycling of the carbon energy, for example for industrial heating (Malinauskaite et al., 2017).

Building materials consume 50% of the world's virgin resources (Baker-Brown, 2019). However, the majority of the unrenewable reserves destined for the construction industry could be spared if more recycled materials were used. Yet the use of building materials made from recycled materials, let alone textile waste has found limited acceptance (Munn & Soebarto, 2004). Although various regenerated textile waste building materials have been developed and tested for almost two decades (Binici et al., 2010; Rubino et al., 2018), it

appears that designers are unaware of all the innovative products available to them. Furthermore, the benefits of the products are not widely marketed; they are perceived as more expensive and/or clients are not willing to pay the price; they are considered less desirable; they are difficult to obtain because innovations are emerging at an accelerated pace and not converting adequately to viable commercial outputs; they are not manufactured to scale; they are not accessible world-wide and they are subject to local codes and restrictions which inhibit their use (Hawley, 2006; Munn & Soebarto, 2004).Yet if 75% of the textile waste remaining from other forms of recycling were channelled into reprocessed materials for the built environment alone, close to 100% of textile waste discarded into landfill could be avoided, while substantially reducing the drain on natural resources. In this way, "the building sector has the largest potential for delivering long-term, significant and cost-effective greenhouse gas emissions"(UNEP, 2009, p. 9). This study argues that a stronger drive for the dissemination and adoption of innovations in textile recycling for building materials is called for.

Enthusiastic media accounts have masked the challenges of diffusion and adoption of innovative building materials with the assumption that innovations are easily accessible once developed and presented (Rogers 1997, 2002). Certainly, the model for commercialising new products through intermediary bodies such as trade fairs, wholesalers and agencies already has a lengthy history. Furthermore, the speed and complexity of new innovations is breaking down the ties between intermediaries – that is, cutting out the 'middleman' through disintermediation, allowing direct innovation-to-consumer pathways to emerge. In some cases, disintermediation has led to more agile markets and quicker adoption of innovations as well as new value creation. For example, disrupted business models based on resource sharing and crowd sourcing services such as Rent the Runway, Fiverr and Kickstarter have become popular, but models based on product (re-)manufacture have been less successful as they require 'scale'. That is, they are not feasible until products have been tested for various parameters, checked for ethical compliance, cleared and covered by copyright, investigated for political impact, certified, delivered in large quantities, marketed and commercialised economically. This represents significant investment into the costly demands of time, expertise and risk (Peter Oluwole Akadiri, 2015). Nonetheless, entrepreneurial teams as well as scientific organisations are taking on the challenge of creating new materials from waste in small quantities and succeeding in bringing them to market. The question is, what are the conditions that lead to small-scale success, and can these conditions or this methodology be reproduced so that many more inventions are commercialised, utilised and ultimately do good, whether at a small or large scale? In linking to the specific case of textile waste for regenerated building material the contribution of this paper lies in probing the interdisciplinary discourse between scientists, engineers, fashion industry participants, building industry stakeholders, distributors and alternative business model start-ups in these sectors.

This study finds that cross disciplinary barriers are an inhibiting factor to the viable development, dissemination and adoption of new products. As a result, new groups of

stakeholders have emerged within the circular economy including eco-consultancies, cross-disciplinary teams and technology driven start-ups. Unsurprisingly new tensions between stakeholders have also arisen and currently remain unresolved, thus also halting innovations transfer. Contrastingly, the lines are gradually blurring between industry specialists such as innovators, start-ups, designers, entrepreneurs, collaborators, promoters and users. This investigation does not propose to untangle the different roles of stakeholders. On the contrary, it proposes to discover how the flow of interactions is redirected in the process of adoption. Potentially the new value creation emerging from these interactions will drive major changes in sustainable design culture for the creative economy of the future.

2. Methodology

In order to understand the flow of ideas and the diffusion of innovations within the complexities of specifically identified sectors of the circular economy, this study uses an exploratory approach to investigate the adoption of innovative, textile waste-based building materials. Importantly it foregrounds the role of the built environment designer, detailing the opportunities and challenges that may arise during the sourcing and specification stage of design. For the purposes of this study, built environment designers are defined as architects, interior designers, landscape designers, industrial designers, product developers and other stakeholders involved in the design process of building construction. The study tables 20 stakeholder firms presenting innovations across textile waste, materials engineering, micro factories (Desai, 2020), social enterprise start-ups, research facilities, design organisations, educational institutions, materials marketing, consultancy firms and media commentators, found through text-based searching strategies (Sikarskie, 2019). A world view is taken for this initial study as these innovations are rarely found in local regions, and at the time of writing, only a handful of applications appear to exist globally. Web research was undertaken because this simulates the most likely initial steps that a designer would undertake in sourcing and specifying new products. That is not to say that designers do not rely on other means for sourcing products, and these are acknowledged as they arise. Information on the scale of the innovations companies is noted if available to provide data for future research. This may become a discriminatory factor informing investigations on more localised organisations in the future. The information also identifies the limitations of innovations currently available within this sector, again providing data for future research.

Importantly my role as fashion designer is also a methodological factor in this investigation. As such I have specialist knowledge on various facets of the fashion industry including textile supply chains and design specification and manufacturing processes but little understanding of materials disposal, materials regeneration or details of the building design and construction processes – beyond the similarities I can guess at through my own work as fashion designer. Once again, this simulates the positions many designers find themselves in.

That is, willing to participate in the circular economy, but at a loss as to how to proceed and communicate across disciplines. But this is precisely the point. As a fashion designer I am interested in the proper disposal of pre and postproduction waste, as well as post use waste and potential associations across industries. I am therefore intentionally investigating an area outside of my discipline to demonstrate an instance of 'cross-disciplinary' communication and investigation, analysing the conditions and processes to uncover challenges and solutions that may occur.

3. Innovations in textile waste for building materials

Sustainability encompasses many facets including the use of environmentally friendly materials as well as the adoption of the circular economy, that is, one in which materials loop back into the production system. Providing a systems model for change, the circular economy serves to arrest the dependence on finite resources and assists the reduction of environmental damage. Within this system, waste, once seen as an unwanted substance, is increasingly viewed as a recurring resource (O'Sullivan, Card, & Fisher, 2019). There are several mainstays in the closed loop system including upcycling, repurposing, reselling and so on. These procedures have been researched and developed over the last decades with materials capture and recycling emerging with promising innovations (Boiten, Li-Chou Han, & Tyler, 2017).

Textiles for recycling are retrieved from two primary high value sources. Pre-consumer textile waste is derived from offcuts and residue of yarn and fabric manufacture, as well as the post-industrial scrap textiles from garment manufacture and other industries. The second source is post-consumer waste, which includes used garments, end of life upholstery and soft furnishings (e.g. curtains, carpets) and expended domestic and commercial manchester. A reason why only around 1% of used fibres are regenerated for use in the garment industry lies in the several complexities in textile waste reprocessing. Many first-phase textiles are made from blended fibres, for example cotton (natural) fibres are often combined in one garment or textile product with polyester (synthetic) filaments. This is a significant deterrent as blended fibres first need to be separated if they are to be regenerating into new yarns. Furthermore, although encouraging innovations in the fibre separation field are underway (Navone et al., 2020), when biodegradable fibres (such as cotton, other cellulose-based fibres, or wool) are mixed with non-biodegradable fibres (such as polyester, acrylic, nylon, or elastane), the resulting yarn is no longer biodegradable (Morlet et al., 2017). Difficulties with removing dyes, additives, processing agents, bio hazards and other contaminants from textile materials often requires further processing steps and additional chemicals to attain satisfactory material parameters (WornAgain, 2020). Recycled fibres are subject to yellowing, degradation, and loss of mechanical properties such as strength and flexibility. Regenerated fibres are often blended with virgin fibres to ensure

the quality required, but the maximum recycled content in the final products is limited (Goldsworthy, 2014). Therefore, the majority of mixed content textile waste is channelled away from the fashion industry to the middle value sector of the waste spectrum, for use in other industries. Fibre not suitable for re-weaving can be reprocessed for non-woven products such as wadding or felts. Once cleaned and spun, fibres can be compressed for use in mattress production for example. Textiles which are sent to the flocking industry are used to produce filling material for furniture padding, panel linings, loudspeaker cones, surface casings and car insulation. Other products regenerated from textile recycling include industrial rags, polishing and cleaning cloths. Polyester chips regenerated from clean garment waste (as distinct from soiled food wrappings for example) are emerging as a high demand resource. They can be liquefied and used to create new fibres for use in regenerated polyester fabrics, fibre for insulation products and fibreboard. Regenerated polyester can also be used for geofabrics, for instance as excavation reinforcement netting (Broda et al., 2019) or injection moulding for playground equipment, park benches, shipping pallets and so on. Ironically climate change has increased the demand for protective, textile-based shade coverings for agriculture. Cellulose (from fabrics such as rayon, viscose, Tencel, bamboo etc) also has a range of uses in its regenerated form. It can be converted back to viscose through wet spinning and can be used in the adhesives and the resin industry (AFC, 2019).

Some of the innovations developed for building products include light weight wall panels from cellulose (cotton), wall and ceiling panel insulation from denim and textile reinforced concrete from mixed fibres. Some of the materials even have distinct advantages over the traditional materials – but this usually comes with a higher cost (Reis, 2009). However, regenerated materials also have disadvantages over virgin materials such as the need for collection, separation, sanitising, anti-fungal and other treatments. Others still are less performative than traditional materials, for example the cellulose fibre in denim insulation is water absorbent and therefore requires better encasing than glass fibre (Fischer, 2015). To be clear, textile waste is not the only source of feedstock for recycled built environment materials. For example, innovations with biomass (such as agricultural cellulose refuse) and used building materials also form part of the circular economy picture in the construction industries (Asdrubali, D'Alessandro, & Schiavoni, 2015). Below is a table of innovations currently available specifically using textile waste in products engineered for use in the built environment:

Table 1. Heim, H. 2020. Innovative building materials and properties - generated from textile waste.

Application	Material/ Product name	Notes
		COMERCIAL PRODUCT
Wall and Ceiling insulation	'Ultratouch'	The denim and cotton fabric is shredded and treated with boric acid to make it flame retardant, and insect, pest, and mildew resistant; no formaldehyde is used; it is twice as expensive as fibreglass; UltraTouch contains no chemical irritants and requires no warning labels. UltraTouch™ Denim Insulation contains 80% post-consumer recycled natural fibres. https://www.bondedlogic.com/ultratouch-denim-insulation/
Hempcrete	'Hempcrete'	Hempcrete is a generic term for a mix of lime, hemp & water; Unlike concrete or masonry, hempcrete does not crack severely under movement. Hence its suitability to be used in earthquake areas. It is also about the seventh of the weight of concrete. Hempcrete consists of hemp shiv, a short length hemp stalk by-product, and lime-based binder. Hempcrete's 'INSULIME' is a proprietary binder to form HLC (Hemp Lime Composite) or Hempcrete (a mixture of an approved lime-based binder and 'INSULCORE' https://hempcrete.com.au/
Floor coverings	'Vilsco' Floor coverings	Vilsco wax fabric printers Using textile misprints, Simone Post's products were first presented to audiences during the Dutch Design Week 2015 and will now be developed together with Label/Breed to produce them industrially and on a bigger scale. https://materialdistrict.com/article/vlisco-the-beauty-of-leftover-materials/
Coatings; Acoustic wall coverings	'Denimtex'	Discarded clothes and jeans fibres are bonded with a bio-based glue. Decorative effects are created by blending multicoloured fibres. The mixture is directly applied to the wall. https://www.denimtex.nl/ https://materialdistrict.com/material/recycled-jeans-and-textile-on-the-wall/
		FUNDED RESEARCH
Insulating panels	'INPAT'	The INPAT project has developed insulating panels for the construction industry. The panels made only from textile

		waste perform better than products currently on the market, both in terms of noise insulation and stability. In addition, they offer good thermal properties and are easy to install. The production process uses high temperatures and pressure to produce a substance like felt which can then be coated to form panels. http://inpat.aitex.net/overview
Wall coverings		UNSW's Centre for Sustainable Materials Research and Technology (SMaRT) has created various building products, panels and tiles from textile waste in their 'Micro-Factory'. https://newsroom.unsw.edu.au/news/science-tech/turning-old-clothes-high-end-building-materials
Panels		Researchers at the School of Architecture at Universidad Politécnica de Madrid (UPM) have developed a lightweight panel made from waste textile fibres. Lighter in weight and providing better acoustic and thermal performance, the used fibres do not require any special treatment before use. The researchers chose to use a binder made from natural hydraulic lime to make the panels. See Material District: https://materialdistrict.com/article/lightweight-wall-panels-waste-textile-fibres/
		MEDIA REPORT
Plastic road surfaces	'Plastiphalt'	Contains plastic bags, glass bottles and toner from used printer cartridges mixed with asphalt. Also used for playgrounds, carpark curbs, speed humps, park tables and benches. https://www.smh.com.au/environment/sustainability/plastic-and-glass-road-that-could-help-solve-australia-s-waste-crisis-20180802-p4zv10.html
		RESEARCH LABORATORY
Bricks		Binici et al. (2010) have created clay bricks mixed with cotton and textile ash to create a lighter weight product (Binici et al., 2010). Agrawal et al. (2013) used four different combinations of polyester, viscose and cotton, in clay bricks showing a higher than average compression value (Agrawal, Watile, Mohata, & Makwana, 2013).
Gypsum board		Melo et al. studied the thermal performances of a gypsum board made with an ethylene-vinyl acetate material derived from the cuttings of expended sheets in the shoe industry.

	The results showed that the material had improved thermal insulation qualities compared to conventional materials (Melo, da Silva, Coutinho, Sousa, & Perazzo, 2012).
Sheeting	Binici et al (2010) found the thermal performance of chipboard improved when lightweight composite materials in which a mixture of fly ash, cotton waste and barite was applied between two chipboards (Binici et al., 2010).
Polymer concrete	Pichardo, P. P., G. Martínez-Barrera, M. Martínez-López, F. Ureña-Núñez and L. I. Ávila-Córdoba (2017). Waste and Recycled Textiles as Reinforcements of Building Materials. Natural and Artificial Fiber-Reinforced Composites as Renewable Sources, IntechOpen London: 89-104.
Plaster screed	Barbero-Barrera et al. (2016) developed mortar by mixing textile waste and lime paste with different lime-water ratios. The authors found textile fibers increase the mechanical properties of plaster mortars (del Mar Barbero-Barrera, Pombo, & de los Angeles Navacerrada, 2016).
Mortar	Kalkan et al. (2016) experimented with denim powder fibers as a new type of mortar reinforcement. The team tested several perlite and pumice mixtures with different denim waste content. The result showed improved mechanical properties and flexibility (Kalkan & Gündüz, 2016).

4. Designing with sustainable materials

One of the most problematic barriers to the use of recycled building products by architects according to Munn and Soebarto (2004) is a lack of knowledge and understanding of recycled materials, and their value and application in the building design process. This implies that more education, trans-disciplinary communication, active promotion and coordination is needed (Peter O Akadiri & Olomolaiye, 2012). First, accurate information and guidelines developed between textile mills, recyclers, materials engineers, building designers and suppliers are needed to create alignment on the best use of fibres for new textile and clothing production that include options for recycling downstream. For example, Fashion Positive's PLUS programme is asking brands, designers, and suppliers to work together on circular fashion outcomes (Morlet et al., 2017). Second, further recommendations are needed once the textile product is used. For example, consultancies such as Circle Economy, along with collectors, sorters, and recycling experts, is running the Fibersort project, which is resulting in data on the volumes of clothing collected in Europe and their different material blends (CircleEconomy, 2019). The Trash-2-Cash research programme is developing

processes for indefinite chemical recycling of textiles. The project involves designers and material scientists at an early stage to ensure the most effective use of the materials recycled (Tubito et al., 2019). Blocktexx is a dedicated textiles waste collector and separator regenerating textile waste feedstock (Powell, 2019).

Another obstacle to using regenerated materials arises from the regulators and standards organisations which are notoriously slow at adopting change. This is understandable as the products created from polymer-based materials (PBMs) such as polyester, elastane and latex may continue to leach chemicals into the environment particularly if subject to weathering processes (Lambert, Sinclair, & Boxall, 2014). Therefore, steps to capture and avoid chemical and micro particle escape must be part of the project design consideration when using recycled materials. A more agile/interim approach that partially addresses the slow approvals challenge is seen in the growth of certification organisations. The Global Recycled Standard (GRS), managed by Textile Exchange, is increasing confidence in recycled materials, by certifying the integrity of products as having been recycled according to International Standards Organisation (ISO) norms (Morlet et al., 2017). Although this does not constitute automatic acceptance by building regulators, it may shorten the time taken by officials to adopt transformation, while increasing confidence and demand from end users.

Standards organisations are not alone in their sluggish uptake of systems transformation. Although the fashion sector is known for its rapid pursuit of trends, it is paradoxically slow in adopting new innovations. According to Vezzoli and Manzini (2008) product or industrial design is a discipline far ahead of fashion design and manufacturing where sustainability and social innovation are concerned. Designing for sustainability in the product design field has "progressively expanded from a technical and product-centric focus towards large scale system level changes in which sustainability is understood as a socio-technical challenge" according to Ceschin and Gaziulusoy (2016, p. 118). Seeing textile waste conversion as a systems issue may facilitate its uptake in the future. A systems issue can be addressed through education along with new business models.

5. Start-ups, micro-factories and dissemination

The inventions developed in research programs and/or by entrepreneurial individuals and organisations often find their way to the start-up world. Start-ups are business model propositions usually built around addressing a problem through the implementation of a new innovation. Programs and events surrounding the start-up ecosystem facilitate the progression from invention to adoption – or at least that is the intention. The workshops and pitch sessions of start-up events provide a nexus point not only for investors but for potential users. Unfortunately, while start-up convenors and participants tend to pitch to financial investors, they may be overlooking large groups of stakeholders such as designers and end users that could promote and accelerate the use of their products. Admittedly some

start-up solutions are not yet developed for scale, but partnerships, dialogue and long-term interest can be established early in the entrepreneurial cycle.

One benefit of the start-up world is its recognition of 'small-scale'. It is inherent in start-up philosophy that small is good, agile, has potential, embodies latent value, and is likely to flourish under the right conditions. This means that even small-scale inventions or prototypes are acceptable in the marketplace. For example, the start-up Miniwiz has set up a portable pop-up store in Sardinia (it has also appeared at London and Milan design festivals) which presents the Trashpresso recycling machines that clean and dry waste that customers bring to the store. The separated recyclables are turned into small flakes. These are combined and heated, then moulded into new shapes which can be used for interior design accessories – such as lampshades and tiles. The entire production process takes less than five minutes, from waste to new product (Pownall, 2019). The retail pop-up shop model has provided an immediate try-before-you-buy model of dissemination for the company's innovations.

The start-up world is not the only arena for dissemination of innovations. Some small-scale entrepreneurs and researchers are actively presenting innovations through the media and digital marketplaces (O'Sullivan et al., 2019). Crowd sourcing and funding websites which present new products directly to consumers such as Kickstarter and Pozzible are building 'direct-to-market' relationships. Industry media and design blogs like Dezeen present innovations but these mostly represent prototypes and the chasm to product specification is not easily bridged. Next-generation 'matchmaking' platforms as well as trade fairs, conventions, online marketplaces and conferences such as Waste Build Amsterdam (WasteBuild, 2019) and Fashion Tech Berlin (FashionTechBerlin, 2020) can inform the designer as well as the end user. They provide a platform for exchange, often blurring the lines between innovators, start-ups and end users, as all are encouraged to contribute to the co-creation economy. By educating, testing and publicising new innovations simultaneously, these trade-fair-cum-symposia are quickening the path to market viability.

Dissemination mechanisms generate the pull required to develop demand and economies of scale, thus adding further value. For example the Excess Materials Exchange platform (EME, 2020) that brings together suppliers and buyers of recycled materials sees waste as a secondary income stream. Similarly, Circle Market, an online trading platform that connects the supply and demand of excess textiles, aimed at the materials engineering industry rather than direct use by the designer, is currently piloting its services with a number of firms globally (CircleMarket, 2020; hollandcircularhotspot, 2019). In another example, Cotton Converts claim to connect the solutions with the problems and accelerate collaborations across brands, charities, government and the consumer (CottonConverts, 2020). It is important to note that during the online research for this project, although media 'hype' was prevalent, it was extremely difficult to find commercially available building materials made from textile (or indeed any other) waste. Furthermore, of the anticipated 20 products researched, only 4 were commercialised, another 12 originated from funded research labs,

university research projects, or media reports but did not appear to have been commercialised. The snapshot in Table 1 demonstrates the current disproportionate uptake of recycling innovations in the building industry.

Micro factories emerging from research centres provide another example of acceptable innovation on a small scale. The team at the university of New South Wales' (UNSW) Centre for Sustainable Materials Research and Technology (SMaRT) has developed high-end composite products from textile waste that can have a wood veneer look or a ceramic-style finish. The products have been lab tested for fire and water resistance, flexibility, acoustic and load-bearing capabilities. Green micro-factories can not only produce high performance materials and products, they eliminate the necessity of expensive machinery (Sahajawalla, 2018).

The jump from university research laboratory to full-scale uptake by designers still presents challenges. At this point, cross-value chain collaboration is needed for innovation to reach scale, but few practitioners venture beyond the borders of their expertise for fear of appearing uninformed or unaccomplished. Construction firms like Urban Art Projects (UAP) provide an excellent example of the collaborative courage required here. Rather than waiting for university laboratory discoveries to reach the market, the company takes the reverse approach, openly conceding their need for new knowledge and call on university research centres (and their expertise and resources) to collaborate and find solutions for materials experiments and applications. The parametrically designed façade for the new W Hotel complex in Brisbane is an example of just such a collaboration (UAP, 2020). Fortunately, those more open to (and perhaps accustomed to) collaborators are comfortable enough with their knowledge requirements to experiment and contribute their vision when cooperating across disciplines. However, this still leaves the research lab in a passive position. For materials to move beyond lab testing and into the marketplace more affirmative action and less risk aversion is also required on the part of the technicians/scientists/engineers and their administrators, not to mention educators.

6. The consumer and market demand

Economic value creation is rapidly giving way to the triple bottom line (3BL) of simultaneously achieving commercial, social and environmental goals (Peter O Akadiri, Chinyio, & Olomolaiye, 2012). However, while economic goals fuelled by fashion overproduction are still dominant, the 100M tonnes of textile waste that is generated annually around the world represents a staggering loss of more than USD 100 billion (GFA, 2019). Importantly Crang, et al (2013) note that global supply chain networks and flows of waste, work not by adding value but by changing the value in the commodity, that is, taking a low value product and transforming it to high value. This is already seen in the transformation of waste plastics. Claimed to be the 'new gold' (Linnenkoper, 2019), clean, recycled plastic is in 'short supply' and therefore has become a high value feedstock product,

with an estimated growth potential of 6% (Locock, 2017). This demonstrates how partnerships and shared investment opportunities between innovators, brands, and manufacturers are leading to solutions that bring recycled materials into the mainstream. This could be augmented by cross-disciplinary firms building trust through longer-term relationships and potentially co-investing in textile waste technologies (Soper, 2019).

The fashion industry, albeit sporadically, is also arising as an innovator and activator in the struggle for supply chain balance (GFA, 2020). That is, many initiatives, campaigns and critiques have been levelled at the fashion industry which have led to a rise in awareness, demand by the consumer for more sustainable practice and change for the better. Despite a slight turn away from fast fashion consumption, the consumer demands alternative approaches from brands that show they are reducing their social and environmental impact (Fletcher & Grose, 2012; Gwilt, 2012). While the consumer market holds the designer accountable, designers are re-defining their approaches to sourcing sustainable materials. Coupled with fashion consumer awareness and the demand for sustainability, the potential for designers and consumers to drive change remains high. The practice of specifying products with higher recycled content by fashion designers is perceived by the consumer as an effective way to meet sustainability targets (Thorpe, 2019).

It is one thing for building designers to understand the value of using recycled materials, but another to understand how value can be created through encouraging the end user to prioritise sustainable materials in their projects. The marketing story of a project should not be underestimated here. Consumers are more likely to buy products from companies who support the causes they care about (Fromm, Lindell, & Decker, 2011), therefore, it is important that building designers are informed of the issues involved and potential solutions, thus placing them in a position to better advise their clients. Foregrounding the circular story represents not only a values shift, but an augmentation of the role from designer to facilitator of sustainable practice. Indeed, some organisations and marketing agencies are understanding the power behind these stories. For example Levis has developed jeans recycling for wall insulation, thereby adding value to the brand itself (Danigelis, 2019). A way to satisfy demand in this latent market is for a building design team to reset the parameters favouring recycled and eco-efficient materials and encourage open dialogue with the contractor/end user on specific options for their project. Granted, consumers in the building trades, where discounts and purchasing incentives operate - are not always the people who make decisions on materials procurement. This also implies, as Munn and Sebarto (2004) suggest that the education and support of built environment designers is essential, as is the acknowledgement by the profession of the imperative of sustainable approaches and of the impact design choices have on the environment. This represents a change in supply chain flows.

Beyond the media and internet exchanges already cited, consumer demand can also be influenced by government agencies' best practice purchasing models (Sweett, 2009). Procurement guidelines that provide organisational buyers with the information needed to

favour recycled materials and circular criteria in their sourcing decisions and public construction tenders can drive demand towards a greater uptake of recycled materials through large-scale public works (Morlet et al., 2017; WasteBuild, 2019). Admittedly, beyond driving demand through government procurement, regulators also need to address the facilitation and potentially incentivise the adoption of recycled materials within building regulations with greater urgency (Mehta, 2019).

Although design for disassembly and the use of recycled materials is well researched (Baker-Brown, 2019; Crowther, 2014), the specifics of materials provenance and their benefits is less well understood. Educational institutions have the opportunity to embed not only the use of, but the prioritisation of specifying recycled and regenerated materials into the curriculum. Improved design education mandates a more discerning approach to design decisions, beyond the aesthetic and structural, ensuring graduates emerge with the potential to positively impact the future. This may require re-evaluation of the teaching of this topic in some design schools around the globe. In some cases, this means 'designing out design' – that is, rather than focusing on the aestheticized result, prioritise the use of and rationale for regenerated materials.

7. Conclusion

This preliminary research into textile waste for building materials has brought to light some of the levers that are currently driving both nascent circular economy activities and sustainable building practice. It appears that some large apparel organisations such as Levis, Nike and Worn Again Technologies are seeing textile waste as a new value resource and successfully developing innovative materials for use in other industries such as the built environment. Smaller companies are also seeing some success in developing textile waste materials. However, a gap remains between innovation and implementation despite the willingness of some early adopters.

The study finds that four significant stakeholder groups need to work in concert for the dissemination and adoption of innovations to occur seamlessly: the innovators (scientists, technicians) the enterprises that adopt and bring the innovations to market (start-ups), the designers (built environment architects) who order or specify the product and the end consumer (builder, public works contractor, owner) who value its use. Regardless of the innovations, many projects are stalled before the commercialisation phase. Industries have an opportunity to combine their efforts through information-sharing to build a comprehensive picture of the materials used throughout various industrial systems and implement them effectively (Morlet et al., 2017).

This paper posed the questions: How might designers source innovative regenerated textile products for use in the built environment? How might the innovators disseminate their ideas, have their technology commercialised, and how can entrepreneurs/start-ups better connect with designers? There are few regulatory initiatives to jumpstart the transfer,

therefore it is up to the various industry stakeholders to make the first moves. This study proposes that the designer is to take greater responsibility when seeking out the supplier, and that the scientist actively promote their work, potentially through collaboration with entrepreneurial start-ups, facing designers. In this way, many new inventions may reach the market and drive change more quickly for the better. A fundamental shift in prioritising social, environmental and entrepreneurial values coupled with responsible design practice will push the circular economy forward, thus imprinting new marks on our lived cultures.

Food Cycles. Processes and products

Silvia Pericu
Dipartimento Architettura e Design, Università di Genova
*silvia.pericu@unige.it

Abstract | This paper illustrates an on-going research project, Creative Food Cycles, that addresses the topic of food as a cross-cutting factor and powerful accelerator towards co-designing sustainability in cities. In this direction, the activities of the two-year-span interdisciplinary project explore new ways, not only of targeting food as an industrial product, but also trying to move the levers of cultural innovation. This culture-based approach to food cycles can provide a deeper understanding of and practical tools to enhance a circular economy in everyday life and become a driver for positive change. The multidisciplinary platform, booted with the project, simultaneously displays a recursive set of thematic actions in three cities, such as workshops, art-installations and itinerant exhibitions, following three phases: from production to distribution on the intersection of digital technologies and scattered food production. Distribution to consumption explores cultural experiences with special focus on new models of distributing, processing and consuming food. Lastly, that from consumption to disposal highlights new ways of recycling food waste as a resource for new materials and prototypes.

KEYWORDS | FOOD CYCLE, FOOD WASTE, CREATIVITY, CIRCULAR ECONOMY, RESILIENCE.

1. Introduction

Food is an essential constituent to guarantee life on the planet, it is our energy and fuel for nourishment, it is needed for growth, and is a key element of most economic, anthropic and cultural systems of every territory and as such it deserves special attention from the design world (Fagnoni, 2019). This is even more evident when one considers how the food industry has conditioned our daily routine in an increasingly intrusive way as postmodernity progresses. From the wheat bread revolution to the invention of refrigeration, and the food globalisation process, culminating in our times, food has turned out to be an industrial product strongly subject to profit and to an unceasing process aiming at better productivity. The invention of refrigeration, in the mid-nineteenth century, provoked a radical and unstoppable change: the delocalisation of food tastes, or food globalisation (FAO, 2004), that is culminating in our time. It is a widespread system, which after the disruptive crisis of the beginning of this century has become ever more a new land of conquest of speculative capital (Liberti, 2016), as a product for mass consumption, that requires the design of its entire lifecycle. (Di Lucchio, 2010).

World population growth, together with diet change in developing countries and land scarcity, makes investment in the sector particularly attractive. It is nothing new, as the food industry has developed over time a fool proof way to subvert the relationship between food, territory and people, and it has progressively and systematically designed the products that support the distribution and consumption of goods in our daily lives. Design cultures today have begun to rethink and question new production, distribution and recycling models of food cycles. The ways of producing, distributing, transforming and consuming it must be reviewed in order to achieve the goals of the UN Agenda by 2030 (UN, 2015). Food provides the opportunity to address the hottest issues of sustainability in our contemporary society, because with its several life-cycle phases it is the common thread that unites almost all the 17 Sustainable Development Goals. As researchers, sustainability issues about food as an industrial product have to be integrated in every design action related to it, and above all it must be taken into account that at a general level people still have some difficulties in understanding the sustainable values of the projects related to this topic. Subsequently, even if they recognise the ones for their own lives, they tend to overlook those for the planet. This must force us to push more strongly sustainable values while developing, communicating, disseminating and practicing our research and actions in order to develop, at the users' side, a sense of responsibility towards every single action dealing with food and to be able to translate inputs from virtuous projects into everyday life practices.

The question that emerges at this point is: can we use food as an accelerator of the disruptive change towards co-designing sustainability in our cities and implement it in our everyday lives? This research project starts from the idea that food is a powerful medium because it has the "ability to work on the functions of the emotional process, which is closely linked to the cognitive process, or rather to the aesthetic emotion that objects trigger" (Di Lucchio, 2010). In particular, taking a step back from the importance and urgency of the

theme, the project addresses creativity about food as a lever of innovation, redesigning food cycles, from production to disposal, trying to anticipate what will happen in the short term, but, above all, to subvert what we are used to and raise awareness as much as possible.

To do this, we must refer to the circular economy cycle for food as a natural system of regeneration in which waste does not exist, but instead is a new resource. From a linear to a circular one, our food system has to be changed with a wide range of actions that can address climate change, create healthy cities, and rebuild biodiversity, because they have come at an enormous cost to society and the environment. There are three main aims in the opportunity to change the global food system that the Ellen Mc Arthur Foundation summarises as follows: "Sourcing food grown regeneratively, and locally where appropriate. Designing and marketing healthier food products. Making the most of food" (2019). These three goals highlight the catalytic role of cities and the necessity to involve local communities, stakeholders and active urban society, developing a cultural and holistic approach, joining all the aspects of food cycles. This also means stimulating with an open and inclusive approach a deeper interconnection of all the disciplines dealing with the urban environment. Starting from the way we build our environment, exploring the potential for cities to act as food production hubs, developing resilient food supplies that rely on a diverse set of local, regional and global sources, according to where food types grow best, reconnecting city dwellers with food and the farmers who grow it, and in the end, of course reducing food waste and co-designing a new concept of waste itself.

2. A call to action

Creativity and food can turn out to be major driving forces in the current cultural and societal field to address this challenge. In recent years, the limits of sectorial policy programmes and academic research have become obvious in addressing the topic of food cycles as a main field of change. In particular, if we refer to the fact that technologies and the availability of ways of production, distribution, consumption and disposal of food are already within our reach, but always and in any case not widespread or adopted for various reasons, including not least, economic viability.

The project Creative Food Cycles (CFC), co-funded by the Creative Europe Programme 2018-20 of the UE, wants to empower cultural actors, accustomed to creative processes, such as architects, product and communication designers and artists, to assume a more proactive attitude, regarding food and its expressive capacity, as a cultural vehicle of identity, innovation and social integration. Even though technological progress allows the availability of new products and techniques, these are not sufficient for the necessary radical change without creativity as a means of diffusion and a call to action. The mandatory radical change for the pursuit of these goals requires a positive and creative attitude to reinterpret the reality that surrounds us and the objects of everyday life. Food is a fertile field both for experimenting, and for full understanding of the relationship between ethical elements and the way we produce, consume and recycle it in our cities. Even more because this topic is an

interesting field of investigation for design which has a “reparative role” (Antonelli, 2019, p.18) in respect of these kinds of environmental and social issues in which the system at a general level and the choices of individual consumers are intimately intertwined.

“Designers and artists are able to formulate, through artifacts and concepts, urgent political questions that cannot rely solely on regular processes to enter public discourse. With regard to the environment and all associated concerns, in particular, state policy is driven to make reforms by the priorities that researchers, designers, activists, scientists, architects and citizens set forth.” (Antonelli, 2018).

3. Food Cycles

This project, according to the sense of urgency, is therefore aimed at creating an international multidisciplinary platform that simultaneously displays a recursive set of thematic actions connected with creativity such as workshops, installations and itinerant exhibitions.

The proposed activities are based on a holistic approach, able to join all the aspects of food cycles through the interlinking of phases curated by the three partners: from production to distribution, from distribution to consumption and from consumption to disposal. Addressing different competences and disciplinary fields, the project aims at transforming three European cities into laboratories of creative food cycles — boosted by the combination of the partners’ competences in advanced information and communication technologies from by IAAC in Barcelona, urban resilience strategies from LUH in Hannover, and inclusive citizen participation and co-creation from DAD UNIGE in Genoa, the designers’ unit.

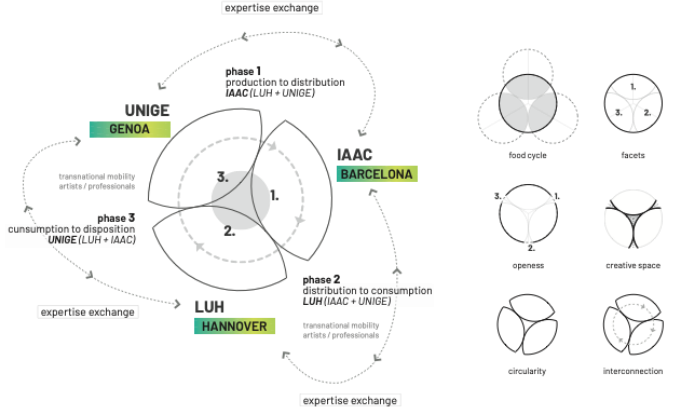

Figure 1. Common methodology of the project: the Food-Cycle Phases and roles of the partners in the international exchanges _ Image: LUH Regionales Bauen und Siedlungsplanung.

The activities start with Food interactions, a co-design activity to edit an open access state of the art catalogue of best practices, including innovative, actualised and implemented projects, combined on a creative attitude basis. The catalogue expresses and materialises sustainable food cycles that emerge from digitalisation, advanced technological implementation, digital manufacturing, sharing and informal economies, innovative participatory processes, increased awareness of climate change and advanced strategies for urban and territorial resilience.

The Food Crossover phase follows in the research activity by proposing three creative workshops, one in each partner city, meant as co-creation open labs to empower thematic skills and to engage diverse audiences. The outputs are collected and illustrated in Food Cycles in action, co-produced art installations and place-making events in the three cities and arranged as an itinerant exhibition travelling to other venues, to end up with an academic symposium to evaluate outcomes, and the final festival at the end of 2020 to present prototypes and proof of concepts to target groups and stakeholders. Every single action of the project is conducted spreading open calls to action and for projects in order to allow a wider participation of professionals and foster local organisations to widen their audiences and to experience international exchange at the same time. Calls for projects are meant as essential tools to collect ideas on the topic of food, but also to allow the creation of a network of proposals, (Fassi & Sedini, 2017) with a high innovation level that can be spread at a larger scale.

From production to **distribution.** How can food cycles enhance the transformation of cities and territories? In this phase the aim is to demonstrate how the use of technology can help to produce food in urban environments, or in close proximity, and enhance city resilience. Urban agriculture has the potential to make healthy and not expensive food available for citizens. Thanks to the use of digital fabrication and control interfaces, CFC shows different ways to produce food to citizens, architects, product and event designers, building self-sufficient cultivations. The use of digital fabrication allows the building of customised design gardens and the use of sensors helps to check performances. If soil cultivation may not be practicable in many urban conditions, especially in dense city cores, a different kind of cultivation can become a practical solution where the lack of space or farming knowledge are the main limitations. The prototypes developed explore these solutions for the cultivation of alternative food, also as new building structures for the urban environment.

Figure 2. Food Shakers | Food Remakers Workshop, Genoa, 17–21 June 2019, was about food waste as new material, from organic food waste to the creation of new industrial materials, or food waste and packaging for new products, from organic food waste to real products for consumers. Workshop participants had the opportunity to showcase the designed prototypes at the 2019 SUQ Intercultural Food, Art and Craft, and Music Festival in Genoa.

Distribution to consumption. How can we imagine a new conviviality through food cycles? The concept of this phase is to focus on new models of distributing, marketing and processing – as well as cooking, displaying, sharing – food in a collective place-making effect. The activities aim to create an urban food hotspot characterised by a multipurpose stage able to connect people, best practices, trends and movements through action. This is made possible bringing together sensorial experiences, digital technologies, storytelling and creativity, offering interactive ways to participate in an experience connected to food, addressing the extended audience who usually shops, consumes and interacts in our urban foodscapes (McKendrick, 2014).

Consumption to disposal. The process from consumption to disposal offers not only options for new uses of discarded food products, which can be transformed from waste to resources - but also focuses on defining new potential meanings of the concept of waste, because waste does not exist in nature and this is a word we have to erase especially if we talk about food. The Unige unit wants to answer the question of how to configure new design and creative experiences related to food and food waste, engaging a wide public to design by and for themselves (Brown, 2009), making sustainable habits and behaviours more compelling and attractive (Mau, 2009). Product design Unige researchers, students and local

urban activists have presented and implemented different activities, in which design has a role as a form of culture and major driving force for the envisioning and realisation of processes of social innovation towards resilience where people change their behaviour and act collaboratively (Manzini, 2015).
The main research outcomes include the development and prototyping of new materials and products obtained from food waste, which demonstrate the multiple aesthetic and ethical possibilities that considering food waste as a resource brings with it. At the same time these projects always work with the main idea of making the population aware of recycling, looking for easy to reproduce procedures and daily use of the products made, but also trying to inspire through the creation of evocative installations.

4. Food Shakers | Food Remakers

Currently, a third of all food produced globally is thrown away each year. Food loss and waste represents one of the most significant environmental and economic issues and it is generally recognised that, if waste were a country, it would be the third-largest greenhouse gas emitter, behind China and the United States (EFC, 2016). It is a well-known issue which also fully involves European and Italian cities, that have to take an active role by making the most of food by redistributing surplus edible food, while turning the remaining inedible by-products into new products, ranging from food products, organic fertilisers to biomaterials (BCFN, 2018). Cities and communities have to be seen, rather than as a final destination for food, as places and environments where food by-products are transformed, through emerging technologies and innovations, into a broad array of valuable materials. A philosophy that is contextualised within a circular economy, using the material energy of food, but also its conceptual one, for a better safeguarding of resources.

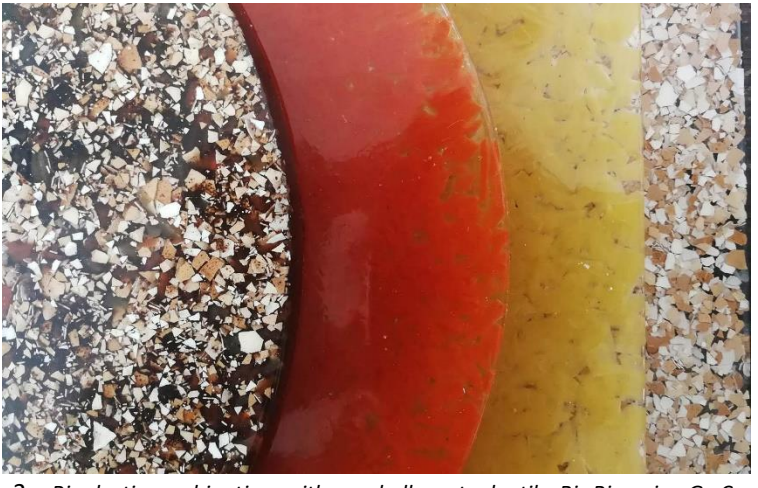

Figure 3. *Bioplastic combination with eggshell, pasta, lentils. Bis Bioresina G. Centineo, M. Lequio, Li Changrui, Shi Xinran. Ph. M. Paolillo*

To investigate the after-consumption phase of food cycles in the *Food Shakers | Food Remakers* workshop and installation of the Unige research team, exploring the concept of food waste as a new material, addresses stakeholders related to design culture such as designers, architects and cultural organisations and to the world of education of all levels.

The project follows a clear public engagement strategy, that starts by mapping the stakeholders, dividing them into categories of interest, and involving them in the action at each stage. A strategy of events is the means to connect CFC to the local relevant citizenship initiatives, aiming to explore the needs and wishes of the communities and their potential, together with the spread of different calls for projects to local stakeholders, to engage them in co-designing activities.

An innovative component is the constant use of public performances - live music, theatre, cooking-shows, etc. - as a common element of the installations that accompany the activities during the project life. These events work as prototyping actions (Fassi & Sedini, 2017), where products and spaces are shown, while people are interacting and experiencing actions connected with the general goals.

From organic food waste to the creation of new industrial materials, to food packaging for new products, or even to real products to eat or to wear for consumers, this process displays materials and products that can permanently change our perception of waste. From the project a strategy could be extrapolated that brings together collections of best practices, co-creation workshops, and installations open to the public that involve different levels of education. Putting together best practices with co-designing activities has proved in the activities carried out to be very effective in raising people's awareness and involving them directly in the creative and realization phase, allowing them to come¬ into contact with food waste as a material that takes on new meaning. In addition, the many prototypes coming out of the project activities of the workshops also have value at the level of innovative proposals, which should be explored and evaluated separately. The involvement of young architects and designers in the design processes of food waste allowed the research teams us to introduce new ideas and generate a high rate of innovation.

Once properly transformed, waste becomes a new resource both for industrial products and for applications in urban installations, following a development model that is anything but new, which takes advantage of new technical opportunities to recover the ancient culture of reuse that produced no waste whatsoever.

This two - years span investigation into the recycling of food waste, developed with product design students and designers under the Creative Program advocacy, makes use of a diversity of media, such as installations, videos and stage performances, to address the topic from multiple perspectives. The goal is to offer a platform for reflection and analysis on the meaning of a new use of materials, on their pervasive DIY production and how design could be an important agent in developing a more responsible use of resources. The results of the research can be measured through the number of prototypes developed, the people

physically involved in the activities and the knowledge produced and disseminated through the online channels. In the end the project is also become an itinerant exhibition that circulates, spreading its message in cities related to the CFC network, and at a digital level it is a website - www.creativefoodcycles.org - conceived as an open platform where every single action that has been produced can be viewed and therefore replicated by using the tools, i.e., workshops, calls to action, calls for projects, webinars and DIY recipes, to generate new ideas and approaches.

Figure 4 Leibniz Universität Hannover, CFC "PorTable". Pop-Up Installation to raise civic actions and people awareness to create more attractive space in cities for food consumption - October 2019. Credits: A. Pape, J. Arfsten for CFC.

This sharing of experiments also follows the concept of a return to materiality as resistance to the prevailing impositions of the digital world: an invitation to return to concrete sensations, such as smelling, feeling and touching, as a privileged space in which to rediscover contact with material reality, without digital intermediation (Han, 2019). Design cultures are in this sense lined up in an activity with strong ethical implications, offering products that aspire to the industrial scale, but in a creative way exploring what our choices may be in the near future, working on our common feelings in relation to food cycles.

5. Conclusions

A design culture-based approach to food cycles i.e., production, consumption and disposal, can provide a deeper understanding, as well as new models, and practical tools to enhance a circular economy in everyday life and become a driver for positive change (Schröder, 2019). Resilient food cycles can be key factors for strategical challenges and opportunities related to urban qualities, cultural values, informal practices, education, economic development, ecological targets and social integration. From the creation of feasible prototypes to the setting up of events, triggered by the three CFC project partners, the research deploys resources to dive into the priority issue of food, that has become increasingly more important as an industrial product, subject to the logic of economic exploitation. Although

unable to affect the system at the level of the economic macro system, the culture of design can provoke a radical change in behaviours, opening up to dialogue with as many people as possible and proposing feasible solutions.

In this direction, the CFC project, particularly with the work of the UNIGE team on reducing waste generation through recycling and reuse in everyday life, aims, on one hand, to test within the academic design community new products and materials derived from food waste, and, on the other hand, to organize creative events to raise awareness of the impact of food cycles in our cities.

In this framework, this paper presents the structure of the CFC research, illustrating the different phases and events and describing the materials and methods of the network and its possible implementations, but also opening a possible discussion on awareness campaigns for issues related to food cycles and their impact in our cities.

The engagement and empowerment of creative communities is the main goal of the CFC project to influence the policy agenda and have a positive impact in order to activate resilient processes. The method applied is the exploration of a constellation of ideas, techniques and prototypes that are considered as a priority so that everyone will be able to move definitively to a circular consumption and production system, capable of avoiding waste.

This implies the development of participatory design activities and specific design tools such as events, call for projects and communication strategies addressed to creative communities. In this project the participatory methods displayed are particularly suitable to create and facilitate the creation and accumulation of social capital at different scales about the central topic of resilient and creative food cycles.

Abstract | Our everyday consumption and interaction with physical artefacts is a major environmental issue. The designers behind most of these artefacts generally refer to them as products or as objects. This status may make conceiving more environmentally relevant solutions difficult. By defining and clarifying the use of these terms in design literature, the different status of artefacts as objects, as products, as things and as stuff are discussed. We also draw on ethnographic studies on longer relations with everyday artefacts in the domestic context. This original research into artefact relations gives insights into the evolving status of possessions as they become domesticated and integrated into daily life patterns. The use of the terms things and stuff rather than objects and products may help reposition design activity (and design education) as not solely concerned with generating new products, something that can be shared with non-designers, encouraging a more responsible approach.

KEYWORDS | THINGS, STUFF, PRODUCT LONGEVITY, PERSON-PRODUCT RELATIONSHIPS, SUSTAINABLE CONSUMPTION

1. Introduction

Our daily consumption and interaction with physical artefacts is a major environmental issue. The designers behind the majority of these artefacts generally refer to them as products or objects. This implied status may make conceiving more environmentally relevant solutions difficult. With emphasis on intentional relations (Jacob, 2019) and essentially visual engagement, terms given for the artefacts around us may need reconsidering, particularly in the disciplines responsible for conceiving them. Whilst objects and products may be the appropriate terms for what is created, artefacts once integrated into our homes and daily lives might be more realistically termed things or stuff.

Findeli (2010) emphasises the need to think of design projects in terms of two main 'moments', the 'conception part' and the 'reception part'. The design act being incomplete "if we do not address what happens to the project's output when it starts its life in the social world". This second stage of artefact experience is increasingly relevant in the context of evolutions towards refusing and reducing more ephemeral consumption and prolonging, where possible, material product relations. Two of the 'Ten Golden Rules of Design for Sustainability' proposed by leading researcher in sustainability and the circular economy, Conny Bakker, (2019) illustrate this. One rule questions how "design can intervene in everyday life to shape and support sustainable lifestyles for (groups of) people and communities". A second rule advocates "design for long use and reuse… creating products that last and that can be loved and cherished, maintained, repaired, reused, upgraded, adapted, personalised, refilled and repurposed for as long as possible." Both rules encourage design for everyday life behaviour and "living with" artefacts over acquisition.

The focus of this research is the second moment of product lives in relation to design process. In the context of longer product lifetimes and the circular economy how might design methodology need to evolve? We question whether the common language vocabulary associated with the conception of everyday artefacts is relevant to current environmental imperatives. In both design education and industry, are the terms used for the artefacts we create relevant to the relations and behaviour we should be encouraging? In the case of physical artefacts, should we still be thinking in terms of products and objects?

2. Limitations

The question of vocabulary best suited to everyday object relations is potentially a very wide subject. Rather than attempting an exhaustive coverage of the question, our aim is to initiate discussions that may be useful for design activity and education. The scope of this discussion is further limited by the design research standpoint; within design process the emphasis is not only on artefacts, but on the human relations and interactions with these artefacts in context (Love, 2002).

Design activity today encompasses experiences and services, concerning both tangible and intangible relations. Nevertheless, in relation to the environmental issues underpinning this research, the studies here will concern relations with physical artefacts, in everyday life, following for example Ben Highmore (2009), for whom design culture concerns the ordinary, the ubiquitous rather than "the extraordinary"

An additional limitation concerns language. Words used for physical artefacts cannot be considered as having direct equivalents in different languages. This article mainly concerns English language terminology. It should be noted that we will mainly discuss four common language terms: objects, products, things and stuff. The word 'artefact' is used as a neutral (and less common language term) for the physical entities discussed in this research.

3. Methodology

The discussion of appropriate terminology for current artefact relations is based on both a literature review and original ethnographic research. Literature from design research and related fields such as anthropology, archaeology, sociology and philosophy illustrates uses of the terms objects, products, things and stuff in the context of artefact relations. The use of these terms gives insights into the relative status implied by these terms for artefacts.

The status and scope of each word is discussed in relation to findings on the nature of longer everyday artefact relations. The findings discussed here are part of wider research into longer relations with everyday objects (Green, 2019b).

The methods used here to gain better understanding of longer everyday artefact relations are situated in the common ground between design research and ethnography. These focus on empathic, collaborative approaches (Lee, 2014) rather than observation alone. Other key aspects of this research, which illustrate the proximity between design research and ethnography/anthropology, are the emphasis on exploration rather than hypothesis testing (Miller, 2010) and situating, rather than separating, observation and description (Ingold, 2011). All the studies cited here relate to research carried out with design students as part of study modules addressing product relations/sustainability.

One study involved detailed descriptions of one everyday artefact relation. Participants commented an everyday artefact they cared about, wanted to keep and made an effort not to lose or damage. 282 useable transcriptions were collected via semi-structured interviews (cohort: 9 to 82 years old, 169 females for 113 males). These were subsequently coded using an iterative process to identify and regroup recurring themes.

Two further studies with cohorts of design students, in years 1, 2, 4 and 5, aimed to generate insights about a wider range of everyday artefact relationships. In the first study 36 students in all were asked to think of, illustrate and comment on ten everyday objects that mattered to them. In the second study, 26 students noted every object they touched over a 12 to 24 hour period and then illustrated this collection, highlighting the objects that mattered more

to them. This second protocol was inspired by the research by Paula Zucotti (2015). These two studies in the form of self-reporting (Author, 2019) inventories taken together highlight the differences between the objects that can be easily thought of at a distance, and those actually encountered and touched *in-situ*.

In introductions to participants these studies the word “object”. was used. While the word “object” possibly orients replies towards ‘objectified’ artefacts (see section 3.2 below), this seemed to be a relatively natural choice for common language expression.

These studies on object relations focused on the domestic context. Clothing was not the main focus, but was not excluded from replies. Over 200 different kinds of objects were commented on covering a range of categories from kitchen appliances, bags and luggage, writing equipment to portable audio and hair/beauty related accessories.

4. Findings

4.1 Artefact terms in (design research) literature

Markosian (2009) mentions that a six year old can give examples of physical objects, demonstrating that these are the most familiar type of object. While being an obvious common-language term for artefact, objects are also non-physical entities, including categories like numbers, sets, universals, propositions, possible worlds, events, facts, minds and souls (Markosian, 2009) In different human and social sciences, objects mean different things. In (Freudian) psycho-analysis an object is likely to be an abstract entity linked to desires or drives (Blandin, 2010). The philosophical object is likely to be simply that which is opposed to the subject, and exterior to the self (Blandin, 2010).

Markosian (2000) suggests differentiating physical and non-physical objects by existence in both time and space. While all objects exist in time, only the ones which also have spatial locations count as physical objects. Closer to the design field, the Theory of Objects project by Dunne & Raby (2015), plays on Meinong’s theory that non-existent or impossible objects should be included in taxonomies of objects if they can be thought of or imagined. The term ‘object’ permits blurred boundaries between the physical and non-physical, but relates to a person/‘subject’ and the notion of thought. The film “Objectified” (Hustwitt, 2009) and forty’s “Objects of Desire” (1992), two key commentaries on the design industry, use ‘object’ to refer to something objectified and remarked. Objects appear to be artefacts distinguished from their surroundings, singularised or even sacralised (Kopytoff, 1986). “An object is that which has been worked by the subject” according to Dagognet (1989), but this “work” can be simply that of contemplating the object.

The word object also appears to be used in the case of artefacts with meaning, such as the *Significant Objects* project imagined by Walker & Glenn (2012). Stuart Walker also uses the

term object when describing artefacts with deep spiritual significance with enduring or sustainable potential. (Walker, 2004)

Objects may have a superior status and a link with personal meaning. Cupchik (2017), uses the expression 'products-as-objects' to describe entities with which people have emotional attachments, and differentiates between 'design products' and 'personally meaningful objects'.

In design education, the term 'object' is perhaps less common than 'product' to describe the activity but is nevertheless quite widely used. The Product design department at the ENS AAMA, (Ecole Nationale Supérieur d'Arts Appliqués et Métiers d'Art) in Paris, has recently been re-baptised Object design. The word object-designer is used by Parsons (2018), professor of the Designed Objects Programs at the School of the Art Institute of Chicago in a short video questioning "What is Object Design?" Here the term 'object' appears to be used to leave open the definition of the activity, (Green, 2019a). The term object may be better suited than the term 'product' for design treating both tangible and intangible solutions

'Product' remains the commonly used term in design literature, reflecting the evident link between design and production. The term product is widely used in artefact experience and interaction (Schifferstein & Hekkert, 2008; Jordan, 2000). Literature proposing design strategies for longer artefact lives generally refers to products (Mugge, 2008, Haug, 2016, Haines-Gadd, Chapman, Lloyd, Mason & Aliakseyeu, 2017). But in the case of the concept of "Emotionally Durable Design" (Chapman, 2005) the term object, and subject-object relationships (Chapman 2010) are also referred to. Related artefact relations are product attachment (Schifferstein & Zwartkruis-Pelgrim, 2008) and product love (Whang, Allen, Savoury & Zhang, 2004). These concepts refer to relationships with specific, singularised artefacts, and their potential for seduction. Artefacts with the potential to seduce or enchant are also referred to as "objects", for example in the case of the (smart) Enchanted Objects described by David Rose (2014).

> "Enchanted objects start as ordinary things - a pen, a wallet, a shoe, a lightbulb, a table. The ordinary thing is then augmented and enhanced through the use of emerging technologies… so that it becomes extraordinary." (Rose, 2014, p47)

This example highlights that the terms 'product' and 'object' may be interchangeable, but that 'things' have a different and lesser status. A 'thing' can be something exterior to the (human) subject unnoticed by him/her (Blandin, 2010), whereas the object emerges from the environment. The term thing seems better suited to the domestic context. Seminal texts on artefact relations, The Comfort of Things (Miller, 2008) and The Meaning of Things, Domestic Symbols and the Self (Csikszentmihalyi & Rochberg-Halton, 1981) refer to relations once artefacts are integrated into the home environment. The things referred to have meanings and significance, but are part of groups, and are not specific individual entities. The word 'thing' itself (or *Ding*) originally referred to a form of archaic assembly (Latour, 2004). Latour suggests that whereas objects (Gegenstände) are matters-of-fact, things are matters-of-concern. 'Things' are perhaps more open to discussion and evolution. Highmore

(2008, p3) suggests that "design studies needs objects, needs things. What it doesn't need, however, is the sense of a design item as a *finished* product that is either adopted and adapted by users, or not."

Things simply exist - and are simply engaged within the responsive, instantaneous 'time' of the everyday (Rinkinen, Jalas & Shove, 2015, quoting Highmore (2002)). They are part of constellations, actions and practices (Shove, 2016). Thomas (2006) confirms the idea, following Heidegger, that physical things are not just objects in consciousness: they are always embedded in a complex network of relations between people and things. Ian Hodder (2016) has written extensively about entanglements between humans and things, how humans and things are linked by dependence, but also how humans are deeply entangled in the vitality of things and the assemblages of their relations.

As well as being part of assemblages and networks, physical 'things' endure over time and undergo change (Thomas, 2020). Odom, Pierce, Stolterman and Blevis (2009) refer to 'things' in their study of why people conserve certain artefacts and not others. In studying care and repair behaviour, Fulton-Suri (2009) also refers to 'things', confirming the link to durability and evolution.

Things can be unobtrusive and have a certain humility (Miller, 2010) that objects and products do not, but they nevertheless influence behaviour. They work by being invisible and being unremarked upon (Miller, 2010) They can be present but 'hiding in plain sight', they can also fade into and emerge from the background (Thomas, 2020).

Even more undefined is 'stuff'. Miller (2010) describes stuff as "ubiquitous and problematic", but also encourages having an attitude towards stuff that doesn't involve opposing ourselves to it. The attitude Miller advocates is one where we face up to and acknowledge stuff, at the same time accepting our own materiality. In The Right Stuff, Markosian proposes a distinction between things and stuff,

> "Stuff, as I understand it, is what things are made of. Think for example of a solid, homogeneous sphere. That's a thing. Now think of the region occupied by the sphere. That region is filled with stuff… In general, stuff fills various regions of space, and some portions of stuff *constitute* things" (Markosian, 2015, p2).

In common language, 'stuff' is both the material that things are made of, but also the things that fill up various regions of space that might be our homes, our cupboards or our backpacks. Stuff is undeniably material. Importantly, stuff, like clutter, can be seen as unstable, volatile and is the opposite of design history's objects with clean lines and meaning-making (Baker, 1995).

Representing the materiality of things, but also unwanted or unmanageable materiality, stuff is probably something design should address. From this short discussion, the advantages of 'things' are also apparent. Things are what inhabit our domestic environment, and are part of ensembles, multiples and entanglements. They are less defined but more durable entities.

While objects are mentioned in literature related to longer artefact relations, 'objects' belong to types of relation where meaning, (self) narrative and significance are generally present. Objects are what is drawn out of the background of everyday experience, and are named. The terms and labels attached to them may endure beyond the physical presence of the artefact. Objects can be things without physical reality. Products share some common ground with objects, and are clearly linked to the first phase of the artefact's lifecycle, and are particularly present in design and marketing literature. Products are also more linked to production and less to the domestic context and relate less to everyday relations.

In the following section, certain qualities and components identified in lasting everyday artefact relationships are discussed. These qualities can be considered in relation to the nature of artefacts as objects, products, things and stuff.

4.2 Artefacts in longer everyday relations

A key insight that emerged from the first extensive collection of data on longer object relations was the lack of references to artefact appearance. Moreover, longitudinal analysis carried out on a sample of 44 detailed replies showed that the presence of visual aspects as a component of lasting relationships diminished over time. This matches existing research by Fenko, Schifferstein and Hekkert (2009) showing a rapid drop in the importance of vision in artefact relations in the first months of possession. Also, despite the fact that two out of three studies mentioned here are based on cohorts of design students, there was a clear absence of comments relating to visual properties, even in the case of artefacts with notable visual details. Positive lasting artefact relations may involve progressive invisibility.

Our studies revealed another kind of artefact invisibility. In the study where the cohort were asked to think of, note and comment 10 objects mattering to them at a distance, they could initially only think of one or two things. It appeared to be difficult for the student cohort to imagine 10 objects that they made an effort to keep, or hoped to continue using, despite the fact that subsequent studies showed that similar cohorts touched between 50 and 100 non-disposable artefacts per day. On average, the cohort (n = 35) were able to list 7.66 artefacts. In addition, it is notable that despite the protocol specifying actual individual artefacts, over 20% (n.=57) of all the artefacts noted (total n.= 268) were categories rather than specific things (pens, bobby pins, sneakers). A further 10% were groups of things (old clothes, personal library, calligraphy material). This suggests these unremarkable everyday artefacts perhaps had blurred status and boundaries.

The study based on the 'Everything we touch' protocol (Zucotti, 2015) gave an insight confirming the uncertain status of material artefacts encountered in daily life. The number of short-life artefacts noted by the cohort ranged from just 3 in some inventories, to over 3O, despite being a reasonably homogenous group (product/service design students aged 18 - 25). It seems unlikely that the number of short-life objects touched (for example tubes of

toothpaste, kitchen sponges, but not single use items) was as different as the results suggest. In follow-up discussions, the cohort mentioned their difficulties paying attention to everything touched. The majority of material artefacts encountered do not particularly stand out.

The notable differences in numbers of short-life artefacts noted can also be an indication of the very personal, idiosyncratic nature of everyday artefact relations. This insight was confirmed by the variety of objects chosen as mattering by participants. An analysis of objects chosen by participants aged between 17 and 26 shows surprising variety, see Table 1 below. Despite probably consuming similar products, the participants in our studies keep and notice very different things in their homes.

Table 1. Variety of objects chosen, cohort aged between 17 - 26 years

study	no.of participants	no. objects per person	total no. of objects	no. of different types	no. of objects chosen only once
one everyday object relation	90	1	90	58	22
10-object inventory	35	5 - 10 (average 7.66)	268	139	72

The multi-faceted nature of longer relations revealed in the initial study (based on open coding of 282 written transcriptions of semi-structured interviews) was confirmed in subsequent studies. While self-related relationship components were present as reasons given for longer relations, they were one of five major components identified (Green 2019b). These five components are provisionally named Using/doing, Feeling on me, Appreciating time, experiencing pleasure and remembering self. These findings suggest that longer artefact relations should not only be thought of in terms of “personally meaningful” objects.

A final insight that seems to confirm the relevance of thinking in terms of stuff is the presence of material related commentary in longer artefact relations. While as a whole, the studies revealed that artefact materiality appears to go unnoticed in everyday interactions, one of the key components in longer relations was an awareness of artefact materiality. Artefacts that mattered were commented in terms of their weight, their capacity or volume, and also the materials they were made of. In many cases longer lasting artefact relations appear to concern things where stuff is noticed.

4.3 Discussion

The selection of findings above relate to a certain type of artefact relation that could be considered environmentally beneficial. While only representing a small part of artefact interactions, they highlight aspects of everyday life relations, when things are kept and cared for and helped to have longer lives. The findings suggest everyday artefact relations better match the terms things and stuff, and even the artefacts that matter are perhaps more "things" than products or objects.

The problems that object and product based terminology may generate have already been discussed in areas related to designing. In the Design Culture Reader, Highmore (2009, p3-4) states that if the everyday material environment is to be considered as an active field of engagements and entanglements, "…this means finding other words to describe the active environment of design rather than 'product', 'status', 'identity' and the like." Encouraging thinking beyond the idea of products, Highmore writes "the way to get to the ordinary, to get to the everydayness of design, requires an approach to design that isn't overawed by novelty".

Rinkinen, Jalas and Shove (2015) writing about understanding material culture and day-to-day practices cite Ingold who proposes that we should:

> "…focus less on the 'objectness' of things and more on the material flows and formative processes through which they come into being … on things in use, recognising that usefulness is always in flux, that it depends on how objects relate to each other, and how they are integrated into one or more practices"

Products and objects are not the best terms for thinking of things in complex bundles; as things in flux and everyday practices. They may relate too much to newness and isolated, noticed artefacts.

Tim Parsons (2018) proposes that "how someone chooses to define design says much about their views on the subject and how they choose to practice it". In the same way, words used for the artefacts that designers work on may influence the way they approach them.

Although this article has mostly focussed on artefact words in the English language, the differences of meaning and the impact of these differences are likely to be present in other languages. This can be illustrated by the example of the words *mono-tsukuri* and *koto-tsukuri* in Japanese:

(物物造り / もの造り) and (事造り / コト造り)

These terms are a combination of *mono/koto* (thing) and *tsukuri* (making) where *mono-tsukuri* can be translated as conscientious manufacturing and *koto-tsukuri* can be translated

as making things happen (Toyota-global.com.) Widely used in relation to designed artefacts, and particularly in automotive design, both '*koto*' and '*mono*' are closer to 'thing' than object in meaning. The two words nevertheless indicate different levels of tangibility, with *mono* being closer to thing in the sense of physical object, or material, and *koto* more likely to be used to describe an event or concept (Fukushima, 2017).

In the same way as 'artefact' words such as products and things can be differentiated by temporality, *mono-tsukuri* can be understood as a means to producing, whereas *koto-tsukuri* can be seen as the event or phenomena it brings about. Ashigawa and Sakuragi (2019) present a simple table measuring common use expressions, with everyday verbs in relation to *mono* and *koto* to clarify their meaning (a *mono* can be eaten, a *koto* cannot). This (subjective) classification exercise (see Table 2.), through common use verbs, can also help to illustrate the physical context, temporality, tangibility and inferred status of the words in our study.

Table 2. "Doing" verbs to differentiate objects/products and things/stuff.

	object/product	thing/stuff
(to) design	X	
(to) purchase	X	X
(to) use	X	X
(to) wash up		X
(to) tidy		X
(to) repair		X
(to) cherish	X	
(to) replace	X	
(to) throw away		X

5. Conclusion/Implications

Certain qualities found in longer everyday artefact relations better match the scope and status of things/stuff, rather than objects/products. Our research establishes that things and stuff better evoke artefact relations after the sales moment, and are equated with the second moment in artefact life-cycles. This second moment being more idiosyncratic and

less ‘product-like’. Things/stuff fit better with end-user implication in the decisions related to the physical artefacts they interact with. Things/stuff are in context and in networks, less related to appearance but present as material/tactile experiences.

While we cannot advocate using the terms thing or stuff in direct replacement for product or object in descriptions of design as an area of study or a professional activity, we can warn against exclusive use of these terms, and hopefully raise awareness of the bias they may create. The aim of this paper is to raise awareness of the need to re-assess artefact-related vocabulary in the design domain.

For design activity and design education to effectively adapt to necessary evolutions in material artefact relations, the way we name these artefacts needs to be questioned and may need to evolve. Changing the vocabulary of design can help in rethinking interactions with materials in everyday life.

Abstract | Although being the main driver of economic growth, cities have simultaneously contributed to the most serious increase of environmental degradation, being simultaneously targeted by Climate Change effects. In this scenario, decision makers are called to identify the best actions for mitigation and adaptation of urban spaces, exploiting innovative Information and Communication Technologies (ICT) resources and approaches. Based on the City Sensing approach, the aim of this paper is to present a case study that demonstrates how the application of integrated ICT frameworks - including free Copernicus satellites data, big data sources and cognitive techniques – to urban regeneration practices such as green infrastructures can support decision makers and citizens in order to create a knowledge community which is aware about air pollutants and carbon emissions of its neighbourhood. Making risk visible and shared will contribute to the modelling of a resilient, inclusive and sustainable city.

KEYWORDS | CLIMATE CHANGE, POLLUTION, SATELLITE, MOSS MAT

1. Introduction

Rapid urbanization and economic growth unveil how cities are the centre of economies, attracting an increased number of people which is expected to reach the 70% of the world's population by 2050 (UNDESA, 2013). Nevertheless, because of their crucial role in driving world economies, cities are mainly responsible for environmental degradation since 1990s (World Bank and Institute for Health Metrics and Evaluation, 2016), with energy and transportation sectors being the most anthropogenic activities responsible for Greenhouse Gas (GHG) emissions and air pollution (FAO, 2016). As a result, the high population density and the proliferation of economic activities have exposed cities to great aggregate risks, with negative impacts in terms of quality of life, environmental security and economic loss (ITU, 2015). This framework unveils a wide spectrum of Climate Change effects, ranging from natural disaster and environmental degradation to diseases, whose uncertainty in terms of climate impacts determines also uncertainty of response.

Urban centres, in fact, are characterized by a distinct capacity and legitimacy to define policies and allocate resources, which is crucial in order to trigger effective interventions (Hunt&Watkiss, 2011). Nevertheless, when speaking of climate change, decision-making process lacks of a full picture of the nature and magnitude of risks as well as of the potential impacts and trends. In order to give legitimacy and authority back to policy-makers, it is necessary to make climate-change risks "visible" (Global Commission on Adaptation, 2019).

2. Research methodology

2.1 Research objectives

The aim of this research is presenting an innovative approach of city planning based on City Sensing which can simultaneously free cities from the burden of air pollution and climate change effects and trigger urban and social regenerative intervention.
The application of integrated technologies, in fact, can contribute to the definition of new approaches to support urban planners in:

- understanding the co-existence of several variables of Climate Change;
- inclusively engaging and connecting researchers, policy-makers, citizens into the decision-making process;
- creating a knowledge and practice community of resiliency (ITU, 2015).

Due to the capacity of regulating urban microclimate of green infrastructures – in particular green roofs made with moss mat covering abandoned public building – the application of innovative technology can develop a reliable measuring system to detect atmospheric pollution which is scalable and allows urban and economic regeneration of abandoned areas

of the city. The United Nation Report on Extreme Poverty and Human Rights shed lights on the possible scenario of a 'climate apartheid' "where the wealthy pay to escape overheating, hunger, and conflict while the rest of the world is left to suffer" (United Nations Human Rights, Office of the High Commissioner, 2019).
Starting from this terrible forecast, the study will propose a sustainable financially and environmentally alternative which empowers the adaptive capacity especially of vulnerable areas and groups.

2.2 Research methodology

City Sensing is a widespread and pervasive approach of city knowledge aimed at supporting urban planning and monitoring and share such a knowledge with key stakeholders in order to trigger a participative city modelling process. Such an interactive, streamlined but comprehensive decision-making is facilitated by the integration of ICT which, on the one hand, improves city resilience and its adaptive capacity thanks to the creation of an informed network of people. On the other, it enables territorial governance through the systematic dissemination and communication between all relevant stakeholders (ITU, 2015; Condotta&Borga, 2012; Borga, 2011).

In particular, heterogeneous quantitative data that have been gathered during this research derive from two different sources: all Open-Source satellites of the Copernicus Mission and on-site surveys and official EUMETSAT[1] databases providing information about pollution levels.

As far as satellites, even if Earth Observation is not systematically used at local level for monitoring atmospheric pollution yet, its accurate resolution guarantees analysis consolidation potential on a continental scale. In particular, the 5P satellite can be widely applied in order to monitor urban air pollution and estimate green areas' sequestration capacity, through the TROPOMI[2] sensor which measure tropospheric pollution.

With the aim of creating a city map, we first developed Sentinel-5P level 2 products to maintain a single grid per orbit (level 3 –L3). The conversion was carried out in a second phase, combining the different data in a single call. They were then merged with the Copernicus atmosphere monitoring service (CAMS) data. Finally, a map of samples was created on a normal spatial lat / lon grid with related product variables. All data have been geometrically corrected and compared with the near real-time data of the ECMWF[3] Integrated Forecasting System (IFS) which assimilate the IASI[4] and MOPITT[5] observations of carbon monoxide (CO) (Inness et al., 2015), provided by the CAMS.

[1] European Organisation for the Exploitation of Meteorological Satellites.
[2] TROPOspheric Monitoring Instrument.
[3] European Centre for Medium-Range Weather Forecasts ECVs Essential Climate Variables.
[4] Infrared Atmospheric Sounding Interferometer.
[5] Measurement of Pollution in the Troposphere.

Data analysis has been carried out on ozone (O^3), carbon monoxide (CO), nitrogen dioxide (NO^2), sulphur dioxide (SO^2) and methane (CH^4). Here we only present data related to CO. The interpolation of CAMS data with the time and position of the single TROPOMI measurement allowed to analyse the average density of the air column, taking into account the sensitivity to the vertical recovery of the TROPOMI sensor.

All the processing tools are Open-source. SNAP[6] libraries have been used for the processing of satellite images. Instead, the control and validation of data is carried out within the Python libraries (TensorFlow, Scikit-Learn, Numpy, Keras etc.) in order to guarantee low-cost services and wider accessibility.

However, the orbit model has some variations. Every day the satellite's orbit moves slightly further east, so even two images of the same position for consecutive days have slightly different ground cover. After 16 days, the satellite passes back to exactly the same geographical point on the ground, restarting the orbit sequence. To solve this problem, we resampled the data on a normal spatial pixel grid. Data fusion was performed using multiple linear regression and its residual spatial interpolation (residual kriging). The results were verified by cross-validation (i.e. the interpolation calculated repeatedly, each time leaving out a sequence of satellite data).

3. A Service Design approach for the city of Munich

In the study case of Munich, the underlying theme is the pollution of urban areas. This project tackles the problem of pollution and urban decay in a holistic way, that is, treating a specific part of the city as an "ecosystem" that includes buildings and people, with the possibility of identifying possible advantageous variables of urban requalification with benefits in terms of environmental well-being by inserting, when possible, economic facilitating devices. The technological solution here developed provides a suite of services for different stakeholders; this solution, if properly connected, selects an integrated and synergistic use of technological, methodological, economic and social resources.

The taken approach is that of Service Design whose concept is linked to the economic financial discipline and indicates an activity of integration and organization of different types of resources, including communication artifacts and materials pertaining to a specific service, aimed at improving the relationship between supplier and end user. In other words, Service Design can be seen as an interdisciplinary approach to the design of a service in which User-centered Design assumes a central importance in giving the service greater usability, desirability, accessibility and attractiveness and is recently described by some research (Prestes Joly, et al, 2019) as a key factor in service innovation.

[6] Stanford Network Analysis Platform.

One of the substantial elements of the approach is for example the use of satellite data. Salinas, et al (2014) show that they use digital tools and georeferenced data, combined with a co-design approach, interactively connecting between citizens, stakeholders and decision makers in the approach to urban problems as it provides a common and shared information base and efficient methods of communication and exchange of information between the various subjects. Salinas, et al, (2014) underline among the main vulnerabilities, the frequent and well-known difficulty of making the most technical aspects of the processes and the very different actors understandable.

The approach to Service Design is applicable on many aspects, however a rather well-known aspect but less applied on a large scale, is certainly linked to the reliability and quality of the information that feed the digital strategies; in this regard, the idea that the blockchain can make a substantial contribution is very widespread and shared, however the examples of application of this technology are still rare. In the future prospects of evolution of this research, the blockchain has a central function in Service Design as it plans to automate the process that guarantees the origin of the information generated from data processing provided by satellite platforms, whose reliability and quality is consolidated.
When satellite data are attributed an economic value, the need for a transfer register is evident, generating related costs and impacts on the service economy; alternatively, a self-certified blockchain-based tracking system that is practically cost-free can be used. The same technological platform, in addition to the structured register, must also perform the important function of a meeting place between sellers and buyers of carbon credits by developing a market in which financial resources of the real market are introduced.

The foregoing lays the foundations for the development of a process in which a subject owning a property to be redeveloped is convenient to carry out a "green intervention" thanks to the guarantees of return on short investment times, as well as bringing an environmental benefit to ensure community.

3.1 Data driven sustainability model for city resilience

The City Sensing approach is specifically oriented towards detailed knowledge of phenomena characterized by high temporal resolution and a medium-large spatial context; for this reason, it is also particularly suitable for this project where the topic of urban sustainability is central. As well known, the concept of sustainability is often characterized by different aspects interconnected with each other, in fact, sustainability understood almost always from an environmental point of view is highly dependent on the economic one and / or related to the social dimension.

In this research, it is developed a cognitive and interpretative model of urban complexity supported by a system of digital data and information whose main objective is to provide a certain and reliable quantification of phenomena and dynamics usually considered unnecessary or not useful. It is possible therefore to speak of a "Data-Driven Sustainability Model" referring to a technological system of monitoring and evaluation of phenomena on

an urban scale that allows to develop real economies aimed at reducing negative impacts and improving the environmental quality and urban space.

4. A project for the city of Munich

4.1 Application of moss mats on abandoned buildings' rooftops

Urban regeneration, known as the installation of different forms of vegetation within the city, including street trees, hanging gardens, green roofs, green walls, etc. represents a strategic approach if supported by enabling technologies. Green infrastructures, in fact, can greatly reduce the level of concentration of particulates and CO^2 through the sequestration capacity of the soil and plants related to photosynthesis and the regulation of the urban microclimate, contrasting the increase in temperature with the evapotranspiration of the leaves (Rete degli orti botanici della Lombardia, 2009; Rete Rurale Nazionale, 2012). Since '90s, green infrastructures and their different applications (green roofs, green walls, vertical gardens) became very popular elements to counter-balance urban pollution's effects and regenerate given areas (Bassan, 2014) through the implantation of some species into the city. A crucial role in sequestrating CO^2 and particulate matter is played in particular by moss which is usually applied to cover roofs and walls of buildings through the creation of a "mat" (Directive 2000/60/CE).

Our case study refers to the city of Munich (Germany) taking as a reference period from February 2019 to August 2019 with the processing of satellite images classified on a monthly average. Munich is Germany's third largest city with the highest population density and the capital of Bavaria, one of the most competitive industrial regions in Europe. Within the project, we processed information from the sentinel 5P satellite, the first mission dedicated to monitoring our atmosphere. Operating in synchronous orbit with the sun, the satellite maps a multitude of air pollutants around the world. The latter, in combination with the auxiliary input data, allowed to elaborate the concentration of each atmospheric gas and to model it on the basis of its absorption characteristics at specific wavelengths of light.
The data we have analysed refer to the air column and not to specific points of the city, this allows us to analyse the problem of air pollution with a different view from the normal ground-based control units[7]. In this study we do not take into account the winds and possible variables that could interfere with our results.

Therefore, the preliminary phase of the study was to identify the surfaces and buildings suitable for hosting garden roofs, green areas. We understood that all buildings cannot accommodate garden roofs or walkable green areas. In particular, the city of Munich has a building architecture mainly characterized by pitched roofs or roofs that are not suitable for

[7] Of course, it must be emphasized that atmospheric central units have much more precise data than satellite data.

extra weights. To solve this problem, we identified our solution in absorbent moss panels. These panels solve numerous problems, first of all the moss does not grow like a classic vertical plant but remains flat and can be installed both on pitched roofs and on all roofs that already house solar panels or external bodies.
Moss is an inexpensive material for insulating homes. It is characterized by environmental compatibility, antiseptic properties, resistance to deformation. Furthermore, moss is characterized by being adaptable to almost all temperatures, in fact it needs little water due to its capacity of capturing it from the air humidity and natural precipitations. For this reason, it is able to remain dry for long periods by changing its color and then greening up as soon as it absorbs water. This guarantees a wider scalability of the solution as the moss mat can be used both in southern and northern Europe.

. Figure 1. Moss installations in Stockholm, Sweden. 2017. Source: © Anselmo Lepore.

Due to the low maintenance needs of the musk carpet, we have studied the effects of its installation on public and abandoned buildings and industrial areas. We have chosen this type of buildings because, on the one hand their large size guarantees a greater surface available to plant the moss. On the other hand, being public buildings, the interlocutor is in most cases a public administration, so it should be simpler finding agreements addressing community benefits. Furthermore, public and industrial buildings are homogeneously located throughout the city.
Authors of many studies from North America and Europe have made strong economic arguments in favour of adaptive reuse of old public buildings, claiming that rehabilitation projects cost around 30 % less than comparable new construction, with possibility to access to tax credits and incentives to offset the high cost of rehabilitation (Rypkema, 1994).
Abandoned buildings are often cataloged as a problem, but with the installation of mosses and green areas they play a double function. The first one is purely aesthetic, the second one is tied to the environment: abandoned buildings may turn into "sponge" buildings, literally buildings with the qualities of absorption of polluting substances.

4.2 Study results

To better define and locate the areas with the highest pollution, Monaco has been divided into 5 areas used as a classification tool for statistical surveys. The 5 areas are very different from each other. For example, area 3 is the historic center, area 1 is mainly industrial, area 4 and 5 are residential and industrial, finally area 2 is a residential area with a strong presence of greenery.

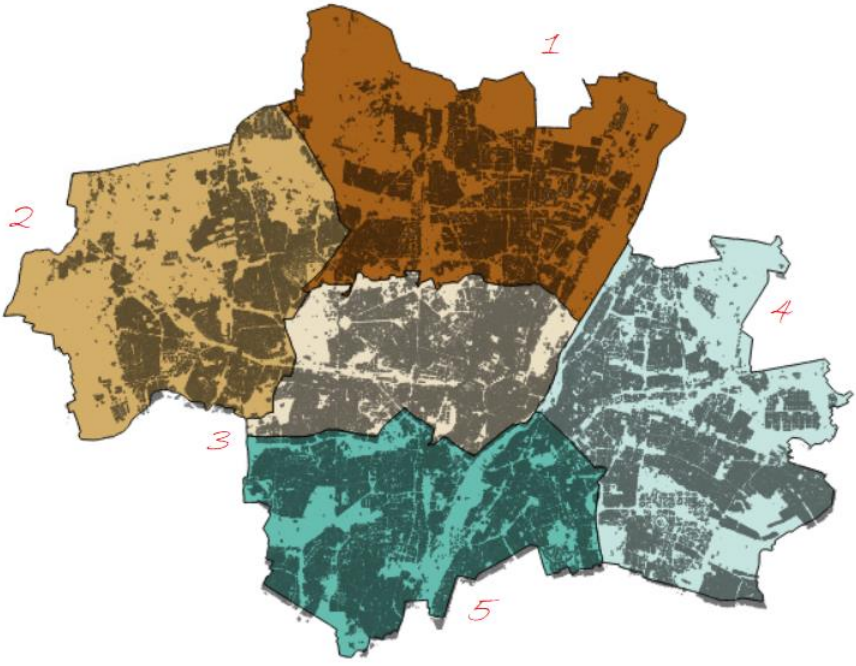

Figure 2. Portioning of Munich in five study areas.

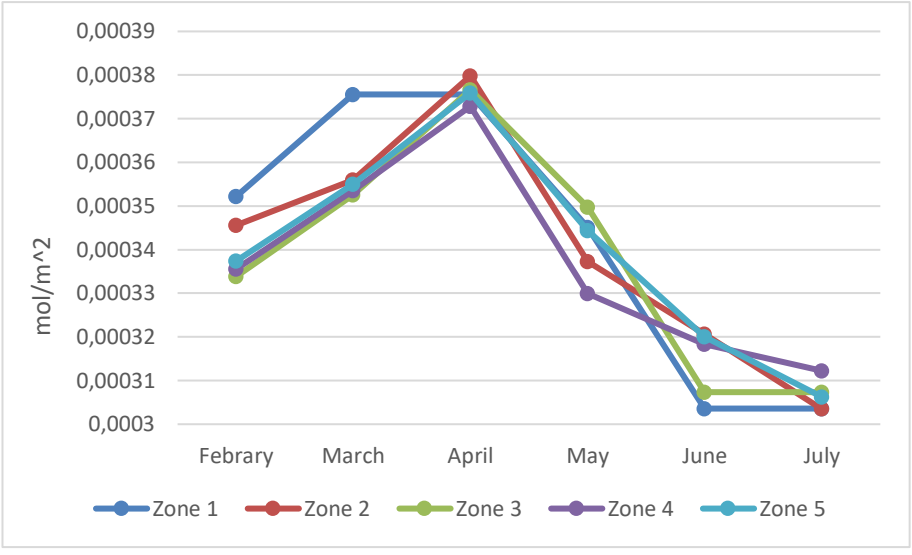

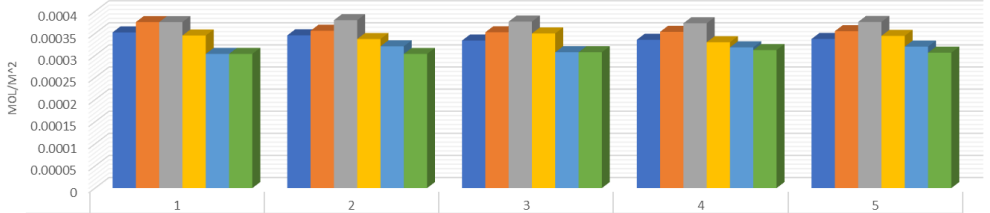

Figure 3. Distribution of Carbon Monoxide within the 5 study areas in Munich expressed in mol/m² (at variable temperature and pressure) – Monthly Average

The reference data used in this document derive from the monthly average of 2/3 images per day.

Figure 4. Distribution of Methane within the 5 study areas in Munich expressed in mol/m²– Monthly Average

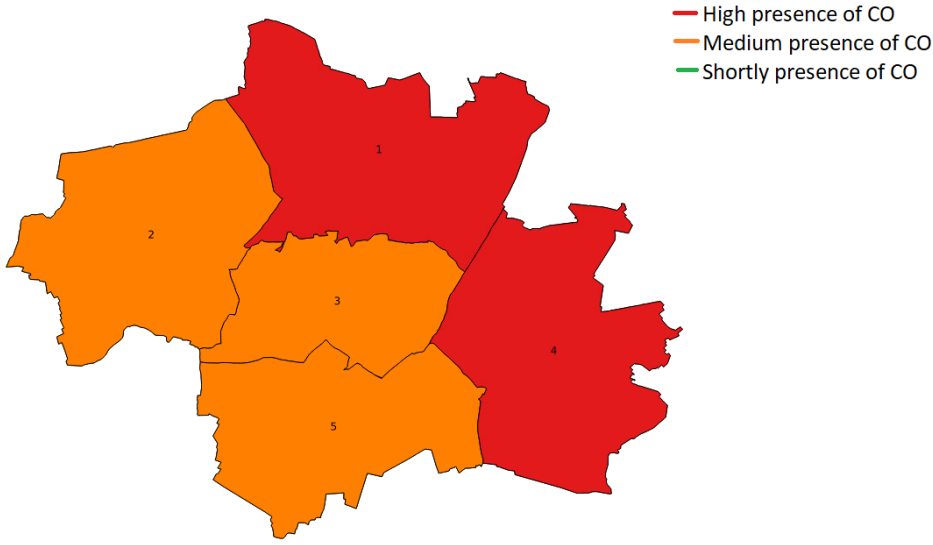

Figure 5. Distribution of Carbon Monoxide within the 5 study areas in Munich expressed in mol/m²– Monthly Average

The figures showed the density values of the vertically integrated CO column. The major polluted areas are 1 and 4. In Figure 3, the influence of weather and climatic conditions on the concentration of pollutants in the atmosphere is noted with precision. In particular, we note that in June and July on average weather was rainier than in March and April, contributing to "cleaning up" the atmosphere. Figure 4, on the other hand, highlights the values of the monthly averages, which show the highest values and therefore a higher concentration of CO in these two areas compared to others. After carefully calculating the aerial columns of the whole city for a period of 6 months, for the purpose of our work we had to detect with certainty the available buildings and their shape. Carbon monoxide (CO) data are calculated using the measurement of the terrestrial radiance of the clear sky and the cloudy sky in the spectral range of 2.3 µm of the short-wave infrared part (SWIR) of the solar spectrum. TROPOMI's clear sky observations provide total CO columns with sensitivity to the tropospheric boundary layer. For cloudy atmospheres, the sensitivity of the column changes according to the path of the light.

Although Sentinel-2 data has a resolution of 10 m, we preferred to use it anyway to make a comparison with the available Open Street Map (OSM) DATA. Therefore, Sentinel-2 images have been classified into a Pixel segmentation and objects like clouds are removed. The

validation led to the division of the territory (August 2019) with the assignment of the respective use (e.g. School, hospital etc.).

Sponge buildings were identified in zones 1 and 4: 65 public buildings with a total area of 175,156 m² were selected. The identification took place using the Google Maps geocoding tool, which allowed us to georefer on a map the addresses of all the public bodies of Monaco, only later through a classification of objects and OSM data we extrapolated the geometry of the building.

Figure 6. Selected "sponge" buildings located in area 1 and 4 of Munich

Finally, a georeferenced file was prepared for the city of Munich. The data on the concentration of air quality have been attributed to the respective geometry of the buildings on a semi-annual and seasonal scale. The data on the half-yearly average concentration were interpolated and then compared with the CAMS monitoring data. From the geometry we extrapolated the surface taking into account the frames and unsuitable areas for

installing the moss. The 65 buildings with their extension could reduce the presence of CO by 15% per month in the two selected areas. The data were calculated taking into account the fact that moss has a storage capacity of 2,500 Ug / m^2 per hour of carbon monoxide and 2,000 Ug / m^2 of methane per hour (Forest Inventory and Analysis Database, 2018). Finally, in addition to the storage of pollutants, the same moss could capture 35 kg m^2 of carbon per year, which can be sold on the voluntary carbon market (Voluntary emission reductions - VER) through the blockchain. Below we show the advantages of the 65 buildings for the two polluted areas of Monaco: the proximity to these green infrastructures is a non-trivial condition to guarantee the highest level of removal of pollutants. With a 1 km buffer that uses Geographic Information System (GIS) tools, we made a projection of the potential benefits of these sponge buildings onto the city. The areas within the green line will benefit most from the presence of green roofs and walls in terms of the effect of mitigating air pollution.

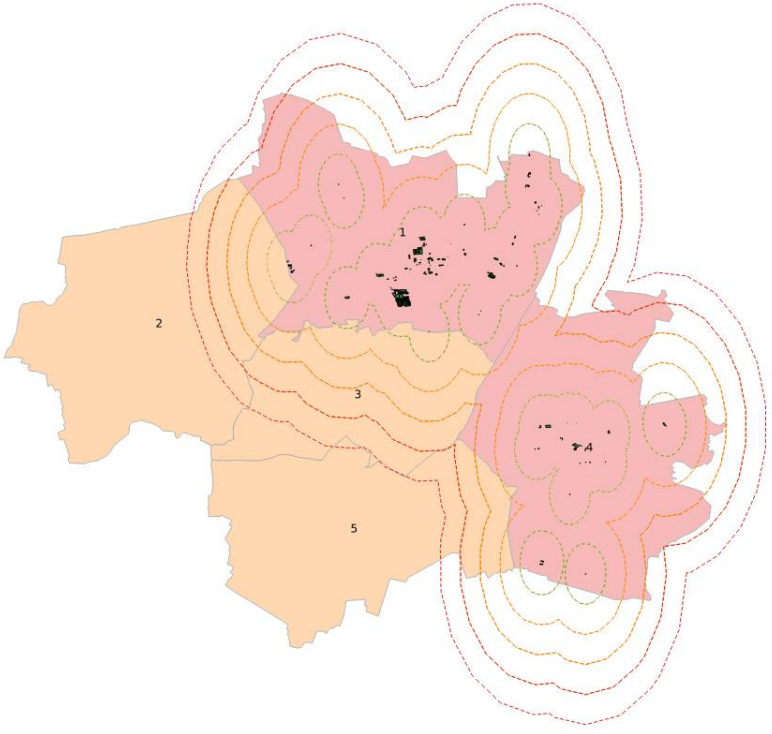

Figure 7. Mitigation effects of sponge buildings in the area 1 and 4 of Munich

5. Conclusions

Main results from the case study of Munich unveil that the extensive use ICT integrated with urban greening and applied in a small reference area can represent a key mitigation and adaptation strategy, expecting therefore higher benefits if applied to the whole city of Munich.

The great advantage of the presented integrated approach is that not only it mitigates climate change effect by monitoring and absorbing carbon emissions, but it also enhances adaptative actions related to the creation of green infrastructures and, in a future, a community-scale business model.

Besides from being the new city lungs, future perspectives are here introduced for green walls through the integration of another technology – blockchain – whose tokenization system can contribute to the transformation of moss mat as net carbon sinks that can generate carbon credits to be sold in the carbon credit market. In this way, we demonstrated here that there is still time to work to build urban resilience and reduce climate risks at all scales with a price which is much cheaper than recovery and rebuilding: building on resilience, we prospect a scalable project which even can take profit from its source of deterioration.

Moreover, the reintroduction of these green infrastructures not only contributes to inner city and suburban recovery, recognizing the importance of recycling old and underutilized buildings in terms of urban requalification, but this also discloses full social opportunities such as the re-acquisition of a sense of community intended as responsibility and obligations for one's place and its residents, which is usually lost when deteriorated vacant buildings appear (Stas, 2007) or gentrification practices are implemented.

Environmental degradation increases everyone's vulnerability to climate change recalling on choral effort in order to empower resilience capacity. Making effects of climate change visible, however, helps integrating this variable into urban planning decisions: the integration of several technologies can therefore trigger experiential learning and participatory planning within communities. Based on City Sensing approach, in fact, our solution gives back decision-making power, especially to most vulnerable groups, allowing the development of shared goals and coordinated actions (Global Commission on Adaptation, 2019).

‘I Don't Want to Feel Outdated’. The dissonance between product attachment and contemporary relevance.

Malene Pilgaard Harsaae

Abstract | Product attachment presents one aspect towards more sustainable clothing consumption. However, empirical research and narratives from several mature Danish women reveal that product attachment runs parallel to their desire to radiate contemporary relevance. This desire challenges product attachment as a path towards more sustainable clothing consumption. Based on this research, the article presents four small narratives, each revealing product attachment working alongside the desire to radiate contemporary relevance. The findings emerging from the narratives are discussed and reveal that a strong product attachment appears to increase the number of times a specific clothing product is used. However, a strong product attachment does not automatically prevent replacement or complementary consumption. The article does not present any solutions to the challenge of creating sustainable consumption but draws attention to the need of redefining what it means ‘to be in fashion’ and thus promoting a paradigm shift within fashion.

KEYWORDS | CLOTHES, FASHION, SUSTAINABILITY, PRODUCT ATTACHMENT, CONTEMPORARY RELEVANCE

1. Introduction

It is incontestable that our current production, consumption, and disposal of clothing has a significant impact on and devastating consequences for the environment. The 2017 report "A new textiles economy: redesigning fashion's future" by Ellen MacArthur Foundation estimates an approximate doubling of the clothing production between 2000 and 2015 (Ellen MacArthur Foundation, 2017, p. 18). The report also draws attention to the under-utilization of clothing.

> "Clothing is massively underused. Worldwide, clothing utilisation – the average number of times a garment is worn before it ceases to be used – has decreased by 36% compared to 15 years ago". (Ellen MacArthur Foundation, 2017, p. 19).

Two main reasons for the underutilization of clothes are discernible. One is the actual nature of the physical product, the way it is manufactured and the materials chosen for the production. Many contemporary clothing products materialize as pure commodities and are not designed and produced with the intention of creating products that last. This approach has consequences in relation to the number of times a piece of clothing can be used either by the original purchaser or in relation to prolonging the useful life of a piece of clothing with a new owner through e.g. second-hand purchase.

The second reason for the underutilization of clothes relates to the users' experiences and satisfaction with the clothing items and the significance of clothes in the construction of identity. Products and consumption in general are repeatedly emphasized as elements by which the individual formats and constructs identity (Giddens, 1997, Baumann, 2000). Clothing products and choices provide a very visible form of consumption and "… performs a major role in the construction of social identity" (Crane, 2000, p. 1). Clothing choices are influenced by cultures and norms, by changing times and fashions, and by the desire to radiate contemporary relevance, "… the desire to be 'in fashion' that promotes consumption". (Entwistle, [2000] 2015, p. xiv).

Overall, the development of the current fast fashion business model focusing on fastest to the market, low prices, an ever faster change of fashion trends, and the increasing speed of new products available on the market have contributed to an upswing in the consumption of fashion / clothing products. These factors have created a consumer culture paradigm of product detachment and short-term satisfaction, leading to underutilization of clothing as product selection does not encourage repair and maintenance of clothing, but fast replacement and early disposal. (Armstrong et al. 2016, Lang et al. 2016, Niinimäki and Hassi, 2011, Clark, 2008, Birtwistle and Moore 2007).

2. Background

One approach to address the underutilization of clothing and to reverse the current downward trend of average times a piece of clothing is used, is an increased focus on designing and producing long-lasting products with a deep product attachment. Product attachment is highlighted as a potential improvement towards more sustainable consumption of products, including clothing. (Mugge et al., 2010, Niinimäki and Hassi, 2011, Niinimäki and Armstrong, 2013, Lang et al., 2016). Designing clothes with the intention of fostering product attachment is however fraught with complexity. "Unfortunately", product attachment arises not only through an optimization of the nature of the products, good fit, long lasting materials, and durable manufacturing. These are all tangible elements that can be addressed and improved though an intensified focus on the design and production of clothing with the intention of making garments that last. Despite disrupting the current dominant fast fashion paradigm, designing and producing clothing that lasts is physically possible. However, creating garments that last in terms of material and manufacture are not the sole factors that contribute to creating a potential product attachment. "Making clothes last is very different from making long-lasting clothes". (Fletcher, 2012, p. 227).

Intangible mechanisms like those of experiences and satisfaction related to situational use and memories related to personal experiences and feelings simultaneously influence product attachments. (Mugge et al., 2010, Niinimäki and Hassi, 2011, Niinimäki and Armstrong, 2013). These are experiences that are uncontrollable for designers.

Additionally, a deep product attachment does not replace the individual's drive to keep up with time and to radiate contemporary relevance by following current fashion trends and changing aesthetics.

> "Rarely does a new item better protect our bodies physically or offer enhanced functionality; rather we buy afresh to make visible our identity both as an individual and part of larger social groups within a particular place and time". (Fletcher, 2012, p. 225).

Not often do consumers thus buy clothes based on physical needs but they are caught in a paradigm of constant change, newness, and planned obsolescence, the paradigm of fashion. "Most clothing purchases are driven by a need to fulfil emotional desires or vanity needs rather than a real need for new clothing" (Niinimäki and Armstrong, 2013, p. 191).
